List of Figures

Fig. i. A flow chart of complete thesis work.

Fig1.1. Overview of the various applications of VOC sensing.

Fig.1.2. Different nanomaterials utilized to fabricate solid state sensors for VOC detection.

Fig. 1.3. Different allotropes of carbon and year of their invention

Fig.1.4. Structure of nanocarbons; (a) graphene (2-D), (b) fullerene (0-D) (source: chem draw 19.0)

Fig.1.5. Pie chart representing the extensive utilization of different metal oxide semiconductors as sensing material.

Fig.1.6. (a) Planar structured sensor, (b) Vertical structured sensor.

Fig1.7. FET structured sensor.

Fig.2.1. TiO_2 nanotube synthesis via electrochemical anodization route.

Fig.2.2. FESEM image of TiO_2 nanotubes:(a) overall view of TiO_2 nanotubes (b) top view; (c) side veiw. Corresponding TEM image of (d) bottom and (e) top of the nanotubes. (f) A schamatic of TiO_2 nanotubes with all the essential dimentions is drown based on the TEM results.

Fig 2.3. XRD spectra of TiO_2 nanotubes.

Fig. 2.4. TiO_2 nanotubes array (a)Photoluminescence, (b) Raman spectra (c)UV vis spectra

Fig. 2.5. XPS spectra of TiO_2 nanotubes (a)Ti2p, (b)O1s

Fig.2.6. Synthesis of undoped *p*-type TiO_2 nanoparticles via sol-gel method.

Fig. 2.7. Undoped *p*-type TiO_2 nanoparticles (a)FESEM, (b) TEM, (c)HRTEM representing the lattice fringes.

Fig. 2.8. Particle size of undoped *p*-type TiO_2 nanoparticle.

Fig. 2.9. XRD spectrum of undoped *p*-type TiO_2 nanoparticle.

Fig. 2.10. Undoped *p*-type TiO_2 nanoparticles; (a) photoluminescence, (b) Raman, and (c) UV vis spectra.

Fig. 2.11. XPS spectra of undoped *p*-type TiO_2 nanoparticles (a) Ti2p, (b) O1s.

Fig.2.12. (a) 0.2 wt% graphene oxide solution. (b) Fullerene aqueous solution.

Fig. 2.13. FESEM Image: (a) graphene oxide, (b) fullerene clusters. (c) Size distribution of fullerene clusters obtained from the FESEM image.

Fig. 2.14. UV vis absorption spectra of (a) graphene oxide, (b) fullerene-C_{60}.

Fig. 2.15. Raman spectra (a) graphene oxide, (b) fullerene.

Fig. 2.16. XPS spectra: Graphene oxide with (a) O1s, (b) C1s; Fullerene with (c) O1s, (d) C1s.

Fig. 3.1. XRD spectra of five different TiO_2 nanotubes with different level of reductions i.e. (a) S_0 (as grown); (b) S_1 (reduction by cathodization at -1.0 V); (c) S_2 (reduction by cathodization at -1.5 V); (d)S_3 (chemical reduction at 85°C); (e) S_4 (chemical reduction at 115°C).

Fig. 3.2. Characterizations to estimate the amount of reduction in TiO_2 nanotubes array with respect to pure TiO_2 nanotubes array: (a) PL spectra; (b) Raman spectra.

Fig. 3.3. High resolution XPS spectra of TiO_2 nanotube array of different level of reduction; (a) Ti2p peak and (b) O1s peak.

Fig. 3.4. Top and side view of sensor device structure with dimensions.

Fig. 3.5 Schematic of the sensor characterization setup to detect volatile organic compounds (VOCs) of different concentrations.

Fig. 3.6. (a) Response magnitude; (b) response time; (c) recovery time; as a function of temperature in 100 ppm of ethanol.

Fig. 3.7. Stability test of (a) S_0; (b) S_1; (c) S_2;(d) S_3;(e) S_4; at 150 ˚C for 100 ppm of ethanol.

Fig. 3.8. Sensing performance of chemically reduced S_3 sensor; (a) transient behaviour (20 to 300 ppm); (b) resistive response magnitude at different temperatures (50 ˚C, 100 ˚C, 150 ˚C); (c) cross sensitivity of ethanol comparing with Benzene, Xylene, 2-propanol and Acetone of 100 pm concentration at 150°C.

Fig. 3.9. A two dimensional schematic of the cross sectional view of TiO_2 nanotube wall.

Fig. 3.10. Planar sensor device structure with dimensions, (a) side view, and (b)top view.

Fig. 3.11. Sensing performance of pure TiO_2 nanoparticle sensor (S_1) (a) Response magnitude to 100 ppm of different VOCs (Formaldehyde, Ethanol, Methanol, Acetone and Toluene) at 100°C, (b) transient behaviour (25 to 300 ppm) towards ethanol at 100 °C, (c) Repeated cycles in exposure to 100 ppm of ethanol at 100 °C, (d) resistive response magnitude at different temperatures (50 ˚C, 100 ˚C, 150 ˚C and 200 ˚C) in exposure to 100 ppm formaldehyde. (e) transient behaviour (1 to 1000 ppm) towards formaldehyde at 150 ˚C, (c) Repeated cycles in exposure to formaldehyde at 150 ˚C.

Fig. 3.12. Intergranular junctions between *p*-TiO_2 NPs with hole accumulation at the surface of nanoparticles in air and VOC ambient.

Fig. 4.1. EDS Spectra: (a) pure TiO_2 nanotubes array (S_0) and (b) GO loaded TiO_2 nanotubes array (S_1).

Fig.4.2. (a) XRD spectra and (b) Raman spectra of pure TiO_2 nanotubes array (S_0) and GO loaded TiO_2 nanotubes array (S_1).

Fig. 4.3 Photoluminescence spectra of pure TiO_2 nanotubes array (S_0) and GO loaded TiO_2 nanotubes (S_1) at 300 nm of excitation

Fig. 4.4. Transient behaviour in exposure to 100 ppm methanol at room temperature of pure TiO_2 nanotubes and GO-Loaded TiO_2 nanotubes.

Fig. 4.5. GO- Loaded TiO_2 nanotubes (a) transient response behaviour within the concentration range of 10 to 1000 ppm, (b) repeated cycles in the exposure to 100 ppm of methanol at room temperature.

Fig. 4.6. Heterojunctions are formed between *p*-type GO and n-TiO_2 nanotubes.

Fig. 4.7. FESEM and TEM images of *p*-TiO_2 nanoparticles (NPs) embedded graphene oxide (GO) on SiO_2/Si substrate. (a) homogeneous mixture of TiO_2 and GO (T:G) in different ratio including pure solution of TiO_2 NPs (T:100%) and GO (G:100%)). FESEM image of (b) S_1: pure *p*-TiO_2 NPs, (c) S_2: 1 vol% GO loaded 99 vol% of *p*-TiO_2 NPs, (d) S_3: 5 vol% GO loaded 95 vol% of *p*-TiO_2 NPs, (e) S_4: 10 vol% GO loaded 90 vol% of *p*-TiO_2 NPs, (f) S_5: 50 vol% GO mixed with 50 vol% of *p*-TiO_2 NPs, (g) S_6: 10 vol% *p*-TiO_2 NPs embedded 90 vol% of GO, (h) S_7: 5 vol% *p*-TiO_2 NPs loaded 95 vol% of GO, (i) S_8: 1 vol% *p*-TiO_2 NPs loaded 99 vol% of GO, (j) S_9: pure GO flakes. TEM images of (k) pure *p*-TiO_2 NPs, (l) *p*-TiO_2 NPs decorated on GO flakes, (m) magnified TEM image of *p*-TiO_2 NPs decoration on GO, (n) *p*-TiO_2 NPs marked with oval shape dotted line showing an average size of ~12 nm, (o) lattice image of single *p*-TiO_2 nanoparticle on GO, (p) HRTEM lattice image of anatase *p*-TiO_2 with a d-spacing of 0.352 nm.

Fig. 4.8. Structural analysis of S_1-S_9. Raman spectra measured under 500 nm laser at room temperature (300 K) shows (a) 100-700 cm^{-1} scan for anatase and (b) 1200-1800 cm^{-1} scan for GO. (c) Photoluminescence (PL) spectra showing a shifting of peak position in visible region, (d) UV Vis spectra of all the samples to estimate absorption edge, (e) sample wise variation of I_D/I_G from Raman spectra (i), centered wavelength shifting from PL spectra (ii) and band gap variation from UV Vis spectra (iii).

Fig. 4.9. XPS spectrum of four selective samples among the nine i.e. S_1 (pure *p*-TiO_2 NPs), S_3 (95 vol% *p*-TiO_2+5 vol% GO), S_8 (1 vol% *p*-TiO_2+ 99 vol% GO) and S_9 (pure GO). (a) Ti2p doublet peaks for S_1, S_3 and S_8. Being a pure GO sample, no Ti2p peaks were observed for S_9. (b) C1s spectrum; S_1, S_3, and S_8 are deconvoluted in three peaks, originated from sp^2 carbon (C-C, C=C), ether (C-O) and Ti-O-C linkage. Additional C=O and COOH peaks were observed for pure GO (S_9) without Ti-O-C peak at 288.3 eV. (c) O1s spectra of pure *p*-TiO_2 NPs (S_1) showed high and low intensity oxygen peak from surface oxygen (Ti-OH) and TiO_2 crystal (Ti-O). O1s spectrum were deconvoluted in three peaks (Ti-O, Ti-O-C and hydroxyl/epoxy) for S_3 and S_8. Strong O1s spectra at 432.6 V for pure GO (S_9) originated from hydroxyl/epoxy groups are available on GO surface.

Fig. 4.10. Schematic of back gated field effect transistor (FET) having *p*-TiO_2 NPs embedded GO channel.

Fig. 4.11. Transfer characteristics (I_{DS}- V_{GS}) of *p*-TiO_2/GO FETs with variable V_{DS} (0.2-1 V) for (a) S_1, (b) S_2, (c) S_3, (d) S_4, (e) S_5, (f) S_6 (g)S_7, (h)S_8 and (i) S_9. No significant field effect was observed in S_1 to S_3.

Fig. 4.12. Electrical characteristics of GO-FET (TG0) and three GO/*p*-TiO_2 hybrid FETs (TG0.5, TG1, and TG5) at room temperature (300 K). Drain current as a function of V_{GS} (at V_{DS}=0.8 V) in (a) linear and (b) log scale. (c) On/off ratio (I_{ON}/I_{OFF}) and (d) Transconductance (g_m) for four FETs. (e) Drain current as a function of V_{DS} at normally 'on' condition i.e. V_{GS}=0 V.

Fig.4.13. (a) I_D-V_{GS} characteristics of S_7 for variable V_{DS} (0.2 to 1 V). (b) On/off ratio ($\frac{I_{ON}}{I_{OFF}}$) and (c) transconductance (g_m) of S_7 as a function of V_{DS}.

Fig.4.14. (a) A possible side view of the channel region where *p*-TiO_2 nanoparticles were decorated to both the bottom and top side of GO flakes, as evidenced from the FESEM images. An extended view of (b) GO/*p*-TiO_2 junctions and (c) GO/*p*-TiO_2/GO junction showing the hole transfer direction in-between GO and *p*-TiO_2. (d) Energy band diagram of GO and *p*-TiO_2 indicating the follow of electron based on the work functions.

Fig.4.15. A qualitative energy band diagram of GO/*p*-TiO_2/GO junction in equilibrium ($V_{DS} = 0$) for different gate to source voltage (a) V_{GS}=0, (b) $0 < V_{GS} < V_{Dirac}$, (c) $V_{GS} = V_{Dirac}$, (d) $V_{GS} > V_{Dirac}$

Fig. 4.16. Response characteristics of S_1 to S_9 in two terminal form where V_{DS} = 0.5 V and V_{GS}=0 V were used. (a) S_6 was considered for the selection of VOC mostly sensitive among different group of VOCs. (b) Response magnitude was calculated from part (a) where S_6 exhibited ethanol selective response. (c) Effect of variable operating temperature (50°C to 200°C) on S_1-S_9 in the exposure of 100 ppm of ethanol. (d) Effect of variable concentration of ethanol (25 ppm to 300 ppm) on S_1-S_9 operated at 100°C.

Fig. 4.17. Transient response of S_1-S_9 sensors within the ethanol concentration range of 25 to 300 ppm at 100°C where $V_{DS} = 0.5\,V$ *and* $V_{GS} = 0$.

Fig. 4.18. I_{DS}- V_{GS} Characteristics in air and 100 ppm ethanol at 100°C for (a) S_7 and (b) S_8. Response calculated from I_{DS}-V_{GS} characteristics by using the expression $\left[\frac{(I_{DS_air} - I_{DS_ethanol})}{I_{DS_ethanol}}\right] \times 100$ for (c) S_7 and (d) S_8. Amplified transient response of (e) S_7 with $V_{GS} = 0.6\,V$ and (f) S_8 with $V_{GS} = 0.7\,V$. Repeated cycles for 100 ppm of ethanol at 100 ˚C (g) S_7 with $V_{GS} = 0.6\,V$ and (h) S_8 with $V_{GS} = 0.7\,V$. (i) S_8 sensor representing the selective nature towards ethanol in comparison to other VOCs at $V_{GS} = 0.7\,V$.

Fig.4.19. Comparative response magnitude between two terminal ($V_{GS} = 0\,V$) and three terminal FET ($V_{GS} > 0\,V$) as a function of ethanol concentration for (g) S_7 and (h) S_8.

Fig.4.20. Schematic of GO channel decorated with distinct *p*-type TiO_2 NPs indicating the drain current in the channel.

Fig. 4.21. Energy band diagram of GO/*p*-TiO_2 heterojunction at (a) zero gate voltage ($V_{GS}=0$) and (b) positive gate voltage ($V_{GS}>0$) for both the air and VOC ambient.

Fig. 5.1. Four major steps i.e. the synthesis of fullerene-C_{60} water colloidal system, anodic growth of the TiO_2 nanotubes array, hydrothermal synthesis of fullerene-C_{60}/TiO_2 nanotubes composites and fabrication of the metal-insulator-metal (MIM) structured sensors, are shown in the flow diagram.

Fig. 5.2. (a) Scanning electron micrograph (SEM) of pure TiO_2 nanotubes array (i.e. S_0) indicating the side and top views. Analysis of cluster (particle) size of C_{60} having different concentrations i.e. C_{60} i.e. (b) 0.006 wt%, (c) 0.01 wt%, (d) 0.02 wt% and (e) 0.05 wt%. SEM images of C_{60}-TiO_2 composites with different concentrations of C_{60} i.e. (f) S_1 (0.006 wt% C_{60}), (g) S_2 (0.01 wt% C_{60}), (h) S_3 (0.02 wt% C_{60}) and (i) S_4 (0.05 wt% C_{60}).

Fig. 5.3. Transmission electron micrograph (TEM) of C_{60}-functionalized TiO_2 nanotubes (S_3). (a, b) C_{60} clusters are decorated on the side wall of TiO_2 nanotubes. (c, d) Very small clusters and individual spheres of C_{60} attached on the wall of TiO_2 nanotube. (e) High resolution TEM

(HRTEM) image of C_{60}-TiO_2 interface showing the lattice spacing of anatase TiO_2. SAED pattern in inset of figure (e).

Fig. 5.4. Spectroscopic characterizations of all the samples (S_0-S_4). (a) XRD spectra, (b) Raman spectra, (c) UV Vis spectra, (d) FT-IR spectra.

Fig. 5.5. Deconvoluted high resolution scan of X-ray photoelectron (a) Ti2p spectra (b) C1s spectra and (c) O1s spectra for all the samples (S_0-S_4).

Fig. 5.6. Comparative response of all the five sensors (S_0-S_4) in the exposure of 100 ppm formaldehyde at 150 ℃.

Fig.5.7. Temperature effect on the transient behaviour of C_{60}-TiO_2 composite sensors i.e. (a) S_1, (b) S_2, (c) S_3 and (d) S_4. (e) Response magnitude, (f) response time and (g) recovery time as a function of temperature for S_1-S_4.

Fig. 5.8. (a) Repeated cycles measured in 100 ppm formaldehyde, (b) transient behaviour within the range of 100 ppb to 100 ppm at 150 ℃ for all the C_{60}-TiO_2 nanotube sensors.

Fig. 5.9. Response magnitude as function of the concentrations of formaldehyde.

Fig. 5.10. (a) Bar chart representing the magnitude of S_3 in the exposure to different VOCs to asses formaldehyde selective nature of the sensor, (b) transient behaviour under different relative humidity (40% - 80%), (c) Comparative response in dry air and different humid conditions with measured response and recovery time for S_3 in 100 ppm of formaldehyde at 150 ˚C.

Fig. 5.11. (a) Energy band diagram of C_{60}-TiO_2 composite indicating possible electronic exchange in air ambient. Possible surface reactions in C_{60}-TiO_2 composite (b) in air ambient, (c) in presence of formaldehyde vapours.

Fig. 5.12. A flow diagram to show the synthesis and fabrication steps of the pure C_{60}, TiO_2 nanoparticles (NP) and C_{60}-TiO_2 composite sensors.

Fig.5.13. FESEM images of (a) pure TiO_2 nanoparticles (S_2), (b) fullerene-C_{60} clusters (S_1), (c, d) C_{60}-TiO_2 nanohybrid (S_3). TEM image of (e) TiO_2 nanoparticles and (f) TiO_2 NPs encapsulated in fullerene-C_{60} clusters (S_3). (g) HRTEM image of the C_{60}-TiO_2 nanohybrid (S_3) indicating the existence of anatase (101) crystallinity with lattice spacing of 0.35 nm.

Fig.5.14. Size analysis of C_{60}–encapsulated TiO_2 NPs.

Fig. 5.15. Spectroscopic characterizations of all the samples. (a) UV vis adsorption spectra, (b) Raman spectra.

Fig. 5.16. XPS spectra with high resolution scan of (a) Ti2p, (b) O1s, (c) C1s peaks.

Fig. 5.17. (a) Natural selectivity tested for S_1-S_3 sensors in exposure to 100 ppm of different VOCs at 150 ˚C, (b) response characteristics of all the three sensors at variable operating temperature (50 ˚C to 200 ˚C) in the exposure of 100 ppm of formaldehyde.

Fig. 5.18. (a) Transient behaviour within the formaldehyde concentration range of 1 to 1000 ppm, (b) repeated cycle characteristics, and (c) response/recovery characteristics measured at 150 ˚C.

Fig. 5.19 Response magnitude as a function of formaldehyde concentrations.

Fig. 5.20. (a) Energy level diagram of C_{60}-TiO_2 composite indicating possible flow of electron in air ambient, (b) Schematic view of the C_{60} encapsulated TiO_2 nanoparticles layer in-between two electrodes.

Fig. 5.21 Sensing mechanism in C_{60} encapsulated TiO_2 nanoparticles with the help of energy band diagram in (a) air and, (b) formaldehyde.
