Abstract	vi
Preface	viii
Contents	xii
List of Abbreviations	xxii
List of Symbols	xxiii
1 Introduction	1
1.1 Floquet theory	3
1.2 Organization of the Thesis	8
2 Formalism: Floquet theory	10
2.1 Floquet Analysis and Floquet Operator	12
2.2 Perturbation theory to generate the effective Hamiltonian: High frequency case	17
2.2.1 Van Vleck expansion	18
2.2.2 Brillouin-Wigner (BW) perturbation theory	20
3 Floquet analysis of a system with fractal spectrum	24
3.1 Introduction	24

3.2	Model	26
3.2.1	Symmetries in the DKT model	28
3.3	Result	29
3.3.1	Properties of Eigenvalues	29
3.3.2	Properties of the eigenstates	30
3.4	Disappearance of the butterfly	34
3.5	Fractal and self-similarity of the DKT spectrum	37
3.5.1	Fractal properties	37
3.5.2	Self Similarity: "Butterfly at every scale"	40
3.6	Conclusion	44
4	Periodically Driven Hard Core Bosonic Systems	46
4.1	Introduction	46
4.2	The Model: driving protocols, observables, initial state, and dynamics	49
4.2.1	Model	49
4.2.2	Driving protocols	54
4.2.3	Observables: Current and Work done	54
4.2.4	Initial state	55
4.2.5	Dynamics of current and work done	57
4.3	Single kick hard core bosons (SKHCB)	60
4.3.1	Some more results of current	62
4.3.2	Some more results of work done	63
4.4	Double kick hard core bosons (DKHCB)	64
4.4.1	Some more results of the current flow	69
	The asymptotic current versus the driving frequency ω :	69
	The saturation current versus the kicking strength α :	70

The saturation current versus the time interval between two kicks Δ :	72
The saturation current as a function of the initial current via ν :	74
4.4.2 Some more results of the work done	75
The work done on the system versus the driving frequency ω :	75
The saturated work done versus the kicking strength α :	77
The saturated work done versus the time interval between two kicks Δ :	77
The saturated work done versus the initial boost/twist ν :	79
4.4.3 Time evolution of density of particles	79
4.4.4 Phase Diagram	82
4.5 Conclusion	84
5 Coupled Kicked Top	86
5.1 Introduction	86
5.2 Model	87
5.3 The effective Hamiltonian of the CKT system	88
5.4 Classical dynamics of the effective Hamiltonian of the CKT	90
5.4.1 Feingold-Peres (FP) limit	93
5.4.2 Nonzero torsions case	93
5.5 Symmetry properties of the effective Hamiltonian of the CKT	95
5.5.1 Feingold-Peres (FP) limit	95
5.5.2 Nonzero torsions case	97
5.6 Conclusion	99
6 Conclusion and Future Scope	101
6.1 Conclusion	101

6.2	Future Scope	104
A	Perturbation methods for calculation of H_{eff}	106
A.1	Van Vleck expansion based method	106
A.1.1	General expression of effective Hamiltonian for a periodically driven system with Dirac δ kick	109
A.2	Brillouin-Wigner Method	110
B	Floquet operator of DKT model and Farey Sequence	112
B.1	Compact form of Floquet Operator	112
B.2	Farey sequence	113
C	Dynamics of Periodically Driven HCB System	115
C.1	Current operator in momentum space	115
C.2	Floquet operator into 2×2 matrix form for SKHCB system.	117
C.3	Current in SKHCB	118
C.4	Floquet time evolution operator for DKHCB	119
C.5	Current flow in DKHCB	123
D	Calculations for Coupled Kicked Top	125
D.1	General formula for H_{eff} for periodically driven system by BW method	125
	Bibliography	128
	List of Publications	A
	Biography of the Supervisor	B
	Biography of the Co-Supervisor	C
	Biography of the Student	D
