PREFACE

TEN years have passed since the publication of the *Chromosome Atlas of Cultivated Plants* by C. D. Darlington and E. K. Janaki Ammal. During these years our knowledge has widened, deepened and developed. Some of the most significant developments have been due to the work of Dr. Janaki Ammal, first in the Royal Horticultural Society's Gardens at Wisley and latterly with the Indian Botanical Survey at Calcutta.

In this interval the known chromosome numbers have been nearly doubled. They have now been studied in some fifty thousand flowering plants belonging to nearly twenty thousand species. In this time too the physical means by which chromosomes change their forms and numbers have been experimentally demonstrated. The evolutionary consequences of these changes have become much clearer. Chromosome systematics has been brought into a fertile union with plant geography and plant ecology.

In view of this growth and transformation the title of the book has been changed in this new edition and its scope extended to include all flowering plants. Its purpose is threefold.

First, for the systematist it is intended to show how chromosome numbers can be used as a basis of the classification of species, genera and families. Secondly, for the plant breeder it is intended to show, in general, the genetic structure of groups of plants and in particular what species may be crossed and with what results. Thirdly, for the cytologist it is intended to show what work has been done and where it has been published. Perhaps we may also disclose a fourth purpose, the personal interest of the authors in which some readers may join us. This is to discover something of value for the geneticist and evolutionist, namely, the rules or laws of chromosome variation.

The first edition of this book already revealed the important principle that the stability of chromosome numbers is a function of the length of the life cycle. Woody plants are immensely stable. Comparison of their chromosome numbers therefore clarifies remote evolutionary relationships. Ephemeral plants are in varying degrees unstable. Comparison of their chromosome numbers therefore clarifies the origins of living species and the foundations of ecological genetics. This principle is useful to us at once for, in producing the atlas, we are enabled to abbreviate the uniform and stable genera and expand the more interesting unstable genera.

The present edition has gone further in indicating the widespread existence with unstable genera of two types of chromosomes: the A chromosomes which maintain heredity and the B chromosomes which stimulate variation. Exploring this distinction offers us an important field of research.

The means of interpreting and exploiting the materials in the Chromosome Atlas were discussed in a lengthy introduction to the first edition. This has now grown to need a separate volume, a companion volume entitled *Chromosome Botany*. Each volume separately will be useful to a particular group of individuals. The two together should be of interest rather to libraries and research laboratories.

Manchester

ACKNOWLEDGMENTS

WE are indebted to Dr. W. B. Turrill of the Royal Botanic Gardens, Kew and Dr. P. S. Hudson of the Imperial Bureau of Plant Breeding and Genetics for the unrestricted use of their libraries.

We are also indebted to numerous collaborators apart from those already mentioned.

Dr. N. W. Simmonds of the Imperial College of Tropical Agriculture, Trinidad, checked uses and distributions of the Musaceae; Miss N. Burbidge of the Herbarium, Kew, the *Eucalyptus* and *Acacia* sections; Mr. G. D. Rowley the succulents (Ficoideae, Cactaceae and Crassulaceae); Major Albert Pam the Amaryllidaceae. Colonel F. C. Stern provided the preliminary list of *Iris* species.

The sources of the ILLUSTRATIONS are given in the Contents (p. xviii) and we wish to thank the authors acknowledged for the use of their figures both published and unpublished.

INTRODUCTION

How to Use the Atlas

FIRST COLUMN: SYSTEMATIC ORDER AND BOTANICAL NAMES

The families of Angiosperms follow the order and bear the numbers of Hutchinson's "Families of Flowering Plants" (Dicotyledons, 1926; Monocotyledons, 1934). 241 out of 332 families are represented. To facilitate reference the whole are divided into 25 groups of orders, as listed in the Contents. Three exceptions are made to Hutchinson's subdivision. (i) We have, on account of their chromosome affinities, retained the Tribes Allieae and Agapantheae in the heterogeneous Liliaceae. (ii) On account of the chromosome evidence we have followed the suggestion of H. P. Traub (1946) and taken the Tribe Hemerocallideae out of the Liliaceae in the Atlas, putting *Hemerocallis* into the Amaryllidaceae and *Hosta* into the Agavaceae. (iii) We have kept the Nolanaceae separate from the Convolvulaceae. We have resisted the temptation, however, to put the Garryaceae back into the Cornaceae.

The families of Gymnosperms are taken from Pilger in Engler and Prantl's *Die Natürlichen Pflanzenfamilien* (1926) and follow our own order. Large families of Angiosperms we have subdivided as follows:

(i) Divided into Tribes:

Ranunculaceae, after W. C. Gregory (1941).

Cruciferae, after Schulz, in Engler and Prantl (1936).

Papilionaceae, after Taubert, 1894, cf. Willis 1931 (but putting *Abrus* out of the Viciae into the Phaseoleae, following Senn, 1938).

Umbelliferae, after Engler, cf. Willis 1931.

Compositae, after Hoffman, in Engler and Gilg (*Syllabus der Pflanzenfamilien*, 1919).

Liliaceae, after Hutchinson, 1934.

Gramineae, after Hubbard (unpublished).

(ii) Divided into sub-families, etc.:

Caryophyllaceae, after Pax, cf. Willis, 1931.

Euphorbiaceae, after Pax, cf. Willis, 1931.

Rosaceae, partly after Focke, cf. Willis, 1931 and Clapham, Tutin and Warburg 1952.

Scrophulariaceae, into Parasites and Non-Parasites.

Myrtaceae, after Niedenzu, in Engler and Prantl (1898).

A synopsis of the tribes given before the families indicates the pattern of variation in chromosome number. The order in which we have taken them generally follows our rule which is to proceed from the lower to the higher basic numbers. Genera within families or tribes we have likewise, with special exceptions, taken in ascending order of basic numbers. Groups are headed by their basic numbers, primary x , secondary x_2 .

Individual genera are likewise subdivided where necessary according to basic number and ploidy. The exceptions are certain large genera which have been, in our view, satisfactorily divided into sections on other grounds, e.g. *Prunus*, *Rosa*, *Primula*, *Crepis*, *Rhododendron*, *Nicotiana*, *Bellevalia*, *Tulipa*, *Calochortus* and *Iris*. Genera in which apomixis is known are noted since its occurrence is usually related to ploidy.

Synonyms or old alternatives corresponding to the whole or part of a genus are given in brackets. The name given by the chromosome author may then be either the first or the second. If the second, a more recent authority has been found in Willis, Bailey, Rehder or Clapham, Tutin and Warburg, confirmed sometimes by the chromosome evidence itself. In particular, Dr. Hubbard corrected the whole of the Gramineae for the first edition in the light of this evidence.

We have not put the conventional \times before the name of an alleged hybrid since in our view this usage has no exact meaning without experimental and cytological control. Such forms often appear in the sixth column as *cult.*

The specific name of a plant without the name of the describer refers to a group of plants resembling the available descriptions or illustrations of the type specimen. When the name of the describer is attached it refers to plants identical in all significant respects with this type specimen. Since type specimens are dead plants in herbaria their chromosome numbers cannot be certainly known. They may often differ from those of plants which seem to be identical with them when lying dead in herbaria. This is proved by the fact that two plants with widely different chromosome numbers are assigned to the same species without qualification by competent systematists. In these circumstances the use of the authority's name in conjunction with the chromosome number would be misleading for the person who made the observation on the chromosomes. And its insertion by a compiler after the event would be actually fraudulent. The chromosome number itself constitutes a new independent criterion of classification. It must not be identified with the Linnean system but must be kept independent if its value is to be utilised in approaching the distant goal of putting the classification of plants and animals on a natural, that is a genetic, basis.

In all, over 15,000 species in 2,500 genera are included in the catalogue. About half the larger genera, those with the greatest constancy, have been abbreviated. The names of species have been omitted where many have the same chromosome number, especially in stable genera, amounting altogether to about 3,000. These genera are indicated by an asterisk. About half the species summarised in this way will be found in the first edition, and the remainder in the references which have always been retained. Similarly the names of some 500 economically important species, which were included in the first edition and whose chromosome numbers are not yet known, have been left out. The remainder, those of greatest interest, amount to about 12,000 species. These are recorded in detail. Some of these have been the subject of extensive study and experiment. The majority, however, have been examined merely from single and even unrepresentative specimens. The effect is that only a part of the natural wealth of variation in chromosome numbers is now revealed. Much remains to be discovered.

SECOND COLUMN: POPULAR NAMES

Important economic or decorative species, or their useful products, have been given their popular, vernacular or commercial names, English and American, Spanish and Portuguese, Hindustani and Hottentot. These names often have a priority over the scientific names and may, we fear, often survive them. In some genera, like *Brassica* and *Iris*, where systematics has been defeated by plant breeding, the popular names often alone have any meaning. On the other hand, we have tried (with partial success) to avoid the many bogus popular names given in reference books which are either scholastic translations or attempts to impose botanical rules on the common speech. Secondary or borrowed popular names such as "Papaw", applied in America since 1760 to *Asimina*, as well as to *Carica papaya* we have placed in quotation marks.

THIRD COLUMN: NUMBERS

The somatic or "diploid" number, and not the gametic or haploid number, is given in all cases. It varies from 6 to 500, and may have been either directly observed or calculated from observations of mitosis in the pollen or of meiosis in the pollen mother cells. The chromosome numbers of experimentally produced haploids and polyploids are put in brackets. Supernumerary chromosomes whose numbers are presumed to be unstable are indicated by B.

Errors. A proportion of the ascriptions of chromosome numbers to names of species are undoubtedly incorrect. In the first edition we estimated the proportion of errors as 5 per cent. In the present edition it is probably reduced to about 3 per cent., divided, we believe, between miscounting, misnaming, and the accidents of hybridisation and labelling in botanic gardens. Where the author is uncertain we prefix *c.* (*circa*). Where we are uncertain of the number, or of its attachment to the botanical name given, we add a question mark. Where the name seems clearly incorrect we put it in quotation marks or add a query.

A more important source of error remains, however, not in the ascription but in the interpretation, where insufficient facts have been given by enthusiasts interested only in accumulating lists of numbers. Where, for example, two numbers not in a polyploid series have been ascribed to one species by different authors we often do not know whether the difference is made up of paired or unpaired chromosomes or of supernumerary or B chromosomes, either new and sporadic or old and well-established. One of the purposes of the Atlas is to reveal these dangers and show how to deal with them: how, in other words, a true chromosome number can be authentically attached to a significant name.

FOURTH COLUMN: AUTHORS

Where two accounts differ in number for the same species we have quoted both. We have omitted only ancient and obvious errors. Where accounts agree, we have reversed the rule of botanical priority and quoted the last important reference, since from this the earlier sources can usually be obtained.

Previous summaries of chromosome numbers are referred to by the following initials as abbreviations:

Delay: D. 1951 (general).

Ishikawa: I. 1916 (general).

Kihara *et alii*: K. 1931 (Japanese cultivated plants).

Löve and Löve: L. & L. 1942, 1944, 1948 (Scandinavian Flora).

Matsuura and Suto: M. & S. 1935 (personal counts).

Maude: M. 1939 (British Flora).

Tischler: T. 1922, 1926, 1931, 1937, 1938 (general), 1950 (Central European Flora).

Most of these lists contain otherwise unpublished information, and Tischler's and Delay's lists form a series of catalogues of nearly all numbers published up to 1950.

In addition we are indebted for some unpublished counts to our colleagues Messrs. L. F. La Cour, R. D. Brock, J. B. Hair, B. Snoad and R. de V. Pienaar and to many correspondents. For special lists we are indebted to:

Professor H. N. Barber and members of the Botany Department, University of Hobart (many Australian plants).

Professor P. T. Thomas, University of Wales, Aberystwyth (African grasses).

Dr. S. Smith-White and other members of the Botany Department, University of Sydney (many Australian plants).

Dr. O. H. Frankel, F.R.S. (*Hebe*).

Dr. H. G. Baker (Geraniaceae, Plumbaginaceae).

Dr. Harlan Lewis (*Clarkia*).

Some 150 unpublished counts by Dr. E. K. Janaki-Ammal for the first edition are initialled EKJ*. These are chiefly grasses and the neglected economic plants of the tropics.

FIFTH COLUMN: USES OF PLANTS

The known or supposed uses of all the more useful plants are summarised. We should have liked to include a similar classification for habits and reproductive methods, but this must be left for a later work. In preparing the catalogue of uses we have chiefly relied on the valuable works listed in the Special References. We have used the Guide to the Kew Museums of Economic Botany and, in addition, various special works and nurserymen's catalogues.

The following initials show our classification of uses:

- A *Alcoholic Liquors*, produced by fermentation (barley for malting, grapes for wine, cocoanut sap for arrak).
- B *Beverages*, produced by infusion (tea, coffee, cocoa).
- C *Carnivorous Plants* (Droseraceae, Sarraceniaceae).
- D *Dyes and Tannins* (indigo, madder, annatto, cassia, wattle, oak bark).
- F *Fruits*, edible by man (apple, mango, orange, banana, lichi, fig, melon, tomato, date palm).
- Fs *Stocks* for fruit and flowering trees (*Atalantia*, *Crataegus*, *Prunus*, *Rosa*).
- Fo *Fodder*, green for cattle, sheep, elephants, etc. (grasses, legumes, roots and trees).
- Fo₁ *Fodder*, for insects (mulberry and *Ricinus* for silkworm, *Opuntia* for cochineal, *Cassia* for shellac insect).
- G *Grains and Pulses* for cattle and man (cereals and legumes, buckwheat).

- H *Horticultural Plants*, grown for decoration, instruction, experiment, protection, curiosity or religious edification, including hedge-plants and lawn grasses.
- I *Insecticides* and *Vermifuges*, for infusion or dusting (nicotine, derris, *Pyrethrum*, santonine).
- M *Medicinal Plants*, drugs and poisons including fish-poisons (casacara, quinine, cocaine, nux vomica, hemp).
- Ma *Green Manure*, chiefly leguminous crops.
- N *Nuts*, edible by man (walnut, chestnut, cocoanut, pistachio).
- O *Oil Seeds* and *Waxes* (linseed, sunflower, rape, cotton-seed, castor oil, sesame, palms).
- P *Perfumes* and *Essential Oils*, naturally volatile (rose, violet, jasmine, lavender, sandalwood, eucalyptus, lemon-grass).
- Par *Parasites* and *Semi-Parasites* (Orobanchaceae, Mistletoe, sandalwood tree).
- R *Roots, Tubers* and *Bulbs*, edible or extractable (potato, turnip, radish, arrowroot, tapioca, yam).
- Re *Resins*, extracted from trees (damar, copal, mastics, balsams, frankincense and myrrh).
- Ru *Rubber* from latex of roots or stems (Euphorbiaceae, Compositae, Asclepiadaceae, Apocynaceae and Sapotaceae).
- Sb *Sand-binders* (bindweeds, grasses and trees).
- Sh *Shade Trees* for parks, avenues, nurseries and plantations (*Grevillea*, *Erythrina*, *Ficus*, *Eucalyptus*, *Cedrus*).
- Sp *Spices* and *Condiments* (peppers, cinnamon, cloves, ginger, herbs of Umbelliferae, Labiatae and Compositae).
- St *Starch*, extracted from stems (*Caryota*, *Cycas*).
- Su *Sugar*, extracted from stems or roots (sugar-cane, sugar-beet and palms). Also sweeteners (liquorice, etc.).
- T *Textile Fibres*, for weaving fabrics, carpets, mats, baskets, ropes and cords and for paper-making and thatching (cotton, jute, hemp, raffia, bamboo).
- To *Tools*: weapons, vessels, pipes, strainers, cleaners, beads, made directly from fruits and stems (gourd, lufa, bamboo, teasel, *Coix*).
- V *Vegetables*, green crops and salads, not roots (cabbage, celery, lettuce, cucurbits).

- Vit *Vitamin C* sources, fruits and stems (*Actinidia*, walnut, rose, paprika).
- W *Wood*, timber, cork and charcoal-wood trees (Gymnosperms, palms, hardwoods).

SIXTH COLUMN: DISTRIBUTIONS

The distributions have been taken primarily from the Index Kewensis, whose main geographical divisions are shown on the back end-papers. This source has been enlarged and amended in the light of more recent authorities particularly Vavilov (1926, 1933, 1950), Bailey's *Hortus Second* (1941), Chittenden's *Dictionary of Gardening* (1951), Laufer's historical "Sino-Iranica" (1919), and special systematic works many of them included in the chromosome studies quoted.

We have translated the ancient and modern Latin localities in the Index Kewensis as follows:

Amphig., Cosmopolitan.

Amphig. Trop., Tropics.

Byzant., S. W. Asia.

Dahuria, Amur.

Geront. Trop., Old World Tropics.

Ind. or., India (not East Indies).

Masc. Ins. (Mascarene Islands), Madagascar, etc.

N. Granat., New Granada, i.e. Colombia.

Oriens., S. W. Asia (including Nile Delta).

Cilicia, Galatia, Pisidia, Asia Minor.

Soongaria, Turkestan.

Taurus, Taurus Mountains.

Mistakes have frequently been made in putting these names into English since no one has undertaken to define them, and their original meaning is now obscured by the process of time.

Forms labelled *cult* are those effectively distinct from wild species. They are chiefly derived from hybridisation of two or more races or species with later selection and with or without later changes of chromosome number.

INDEX TO FAMILIES AND GENERA

Family names, capitals

Genus names asterisked—counts summarised

Page references to figures in italics

- Abelia 241
Abeliophyllum 227
Abies 5
Abrus 171
Abutilon* 122
Acacia 151
Acalypha 128
ACANTHACEAE 321
Acanthocereus 102
Acantholimon 282
Acantholippia 324
Acanthopanax 204
Acanthostachys 343
Acanthus 322
Acer 198
ACERACEAE 198
Aceranthus 27
Aceras 409
Achillea* 268
Achlys 27
Achras 225
Achyranthes 77
Acinos 328
Aciphylla 206
Acnistus 303
Aconitum* 20
Acorus 374
Acroceras 425
Acronychia 196
Acrotiche 220
Actaea 20
Actinidia 109
ACTINIDIACEAE 109
Actinodium 110
Actinophloeus 396
Actinostemma 98
Actinotus 209
Adelocaryum 295
Adenocalymma 319
Adenophora 289
Adenostyles 270
Adesmia 156
Adhatoda 322
Adlumia 35
Adonis 25
Adoxa 243
ADOXACEAE 243
Adromischus 54
Aechmea* 343
Aegilops 450
Aegilotricum 453
Aegle 194
Aeglopsis 193
Aegopodium 207
Aeluropus 429
Aeonium 55
Aerides 407
Aeschynomene 158
Aesculus 187, 197
Aethionema* 37
Aethusa 205
Afraegle 193
Agapanthus 362
Agathis 4
AGAVACEAE 393
Agave* 394, 395
Ageratum 270
Aglanema 373
Agonis 110
Agoseris* 251
Agrimonia 141
Agropyron* 452
Agrostemma 62
Agrostis* 436
Agrotriticum 453
Aichryson 55
Ailanthus 196
Aiphanes 398
Aira 447
Airopsis 447
Ajuga 328
Akebia 29
ALANGIACEAE 203
Alangium 203
Albizzia 152
Albuca 353
Alchemilla 142
Alectorolophus 315
Alectorurus 365
Alettris 370
Aleurites 129
Alisma 336
ALISMACEAE 336
Alkanna 297
Allamanda 229
Alliaria 41
Allionia 90
Allium* 355, 357
Alloteropsis 425
Alnus 179
Alocasia 375
Aloë* 362
Alonsoa 309
Alopecurus 437
Aloysia 324
Alpinia 346
Alsine 62
Alstroemeria 373
ALSTROEMERIACEAE 373
Althaea 121
Alyssum* 42
Amana 361
AMARANTHACEAE 77
Amaranthus 78
AMARYLLIDACEAE 377
Amaryllis 381
Amberboa 262
Ambrosia 254
Ambrosinia 374
Amburana 148
Amelanchier 145
Amelosorbus 147
Amherstia 149
Ammi 206
Ammobium 260
Ammocharis 381
Ammophila 436
Amomum 346
Amorpha 165
Amorphophallus 374
AMPELIDACEAE 192
Ampelodesmos 457
Ampelopsis 192
Amphicarpa 170
Amphicarpum 424
Amphilophis 419
Amphilophium 320
Amsinckia 294
Anacamptis 406
ANACARDIACEAE 198

Anacardium 199
Anacharis 335
Anacyclus 267
Anagallis 280
Anagraecum 407
Ananas 344
Anaphalis 259
Anarrhinum 313
Anchusa 294, 295, 297
Andersonia 221
Andira 172
Andromeda 216
Andropogon 419, 420, 421
Androsace 280
Andryala* 250
Aneilema 339
Anemarrhena 365
Anemone* 23
Anemonella 21
Anemopaegma 319
Anemopsis 19
Anethum 206
Angelica 210
Angelonia 314
Angophora 110
Anguillaria 369
Anigozanthus 403
Anisocoma 248
Anisoptera 110
Annona *II*, 15
ANNONACEAE 15
Anoda 126
Anogra 87
Anoiganthus 380
Antennaria 259
Anthemis 267
Anthephora 424
Anthericum 364
Anthochloa 446
Antholyza 388, 389
Anthoxanthum 438
Anthriscus 207
Anthurium* 376
Anthyllis 158
Antigonon 74
Antirrhinum* 312, 313, 314
Apargidium 250
Apatesia 66
Apera 435
Aphanes 142
Apicra 363
Apios 170
Apium 206
Apluda 419
APOCYNACEAE 229
Apocynum, 230
Aposeria 249
Aptenia 66

AQUIFOLIACEAE 189
Aquilegia* 22
Arabidopsis 40
Arabis 42
ARACEAE 373
Arachis 158
Aragonia 320
Aralia 204
ARALIACEAE 204
Araucaria 4
ARAUCARIACEAE 4
Araujia 230
Arbutus 216
Arctagrostis 438
Arctium 262
Arctophila 446
Arctostaphylos 216
Arctotis 265
Arctous 216
Ardisia 225
Areca 396
Arecastrum 396
Aregelia 343
Arenaria 61
Arenga 396
Argemone 34
Argyllia 318
Argyrea 308
Argyroderma 66
Argyrolobium 167
Aridaria* 68
Arikuryroba 396
Ariocarpus 105
Ariopsis 376
Arisaema* 375
Aristida 434
Aristolochia 29
ARISTOLOCHIACEAE 29
Armeria 281
Armoracia 40
Arnica 264
Arnoseris 250
Aronia 145
Arrabidaea 319
Arrhenatherum 448
Artabotrys 15
Artemisia* 266
Arthraxon 422
Arthrocnemum 77
Arthropodium 365, 366
Arthrosamanea 152
Artocarpus 184
Arum 375
Arundinaria 457
Arundinella 429
Arundo 457
Asarina 313
Asarum 29

ASCLEPIADACEAE 230
Asclepias 230
Ascotainia 406
Asimina* 15
Asparagus 369
Asperugo 295
Asperula* 235
Asphodeline 364
Asphodelus 364
Aspidistra 371
Astelia 368
Aster* 255, 257
Asteriscium 209
Asteriscus 258
Asterolalia 195
Asteromoea 257
Astilbe 56
Astilboides 58
Astragalus* 163, 164
Astranthium 255
Astrantia 208
Astrebla 434
Astridia 66
Astrocarpus 50
Astrodaucus 208
Astroloba 363
Astroloma* 220
Astronium 199
Astrophytum* 102
Asyneuma 287
Atalantia 193
Atamisquea 36
Ateleia 170
Athamantia 206
Athrotaxis 4
Atractylis 261
Atraphaxis 74
Atrichoseris 250
Atriplex* 76
Atropa 307
Attalea 397
Atylosia 171
Aubrietia 42
Aucuba 203
Aulax* 91
Avena 447, 448
Averrhoa 85
Axonopus 427
Azorella 209

Babiana 384
Baccharis 256
Backhousia 110
Bacckea* 111
Baeometra 369
Balanites 82
Balanophora 190

BALANOPHORACEAE
 190
Baldellia 336
Baliospermum 128
Ballota 329
BALSAMINACEAE 85
Balsamorhiza 255
Bambusa 458
Banisteria 126
Banksia 90
Baptisia 166
Barbarea* 43
Bartonia 36, 276
Bartschia 316
Bartsia 316
Bartlingia 368
Basella 78
BASELLACEAE 78
Bassia* 75, 225
Bastardia 121
Bauera 133
Bauhinia 150
Beckmannia 432
Begonia 100
BEGONIACEAE 100
Belairia 169
Belamcanda 388
Bellevalia 351
Bellis 255, 257
Bellium 257
Benincasa 100
Benzoin 16
BERBERIDACEAE 27
Berberis* 28
Bergenia 59
Bergeranthus* 68
Bergia 59
Berkheya 265
Bernardia 130
Berteroa 42
Berula 205
Beschorneria 394
Beta 76
Betonica 324
Betula 175, 180
BETULACEAE 179
Bidens 254
Bifora 210
Bignonia 319, 320
BIGNONIACEAE 318
Bijlia 66
Billbergia* 343
Biscutella* 38
Biserrula 163
Bivonaea 39
Bixa, 95
BIXACEAE 95
Blackstonia 276

Blennosperma 264
Blepharidachne 440
Bletia 406
Bletilla 406
Bloomeria 355
Blumenbachia 36
Blysmus 416
Blyxa 335
Bocconia 34
Boehmeria 185
Boenninghausenia 195
Boissiera 440
Boltonia 257
Bomarea 373
BOMBACACEAE 120
Bombax 120
Bongardia 28
Boöphone 381
Bootia 335
BORAGINACEAE 294
Borago 296
Borassus 398
Borderea 393
Boronia* 194
Borzicactus 102
Bothriochloa 421
Bougainvillea 90
Boussingaultia 77
Bouteloua 432
Bouvardia 235
Bowenia 3
Bowiea 369
Bowlesia 209
Boykinia 58
Brabeium 90
Brachiaria 424
Brachychilus 346
Brachycyrtis 370
Brachyelytrum 455
Brachyloma 220
Brachypodium 446
Brahea 396
Brassavola 407
Brassica 46
Bravoa 394
Braya 41
Bredemeyera 50
Brevoortia 355
Breynia 130
Bridelia 130
Briza 439
Brodiaea 354, 355
Bromelia 343
BROMELIACEAE 343
Bromus* 441
Brosimum 183
Broussonetia 183
Browallia 302

Brownea 149
Bruckenthalia 215
Brunella 328
Brunfelsia 303
Brunnera 294
Brunsvigia 381
Bryonia 99
Bryophyllum* 55
Buchloë 434
Buckleya 190
Buddleia 226
Bulbine 365
Bulbinella 364
Bulbocodium 368
Bulbostylis 414
Bulnesia 82
Bumelia 225
Bunias 44
Buphthalmum 258
Bupleurum 205
BURSERACEAE 197
Butia 397
BUTOMACEAE 335
Butomus 335
BUXACEAE 177
Buxus 177

Cabomba 27
Cacalia 262, 264
Caccinia 294
CACTACEAE 101
CAESALPINACEAE 147
Caesalpinia 149
Caliophora 35
Cajanus 171
Cakile 47
Caladium 376
Calamagrostis* 437
Calamintha 328, 329
Calamus 396
Calandrinia 71
Calanthe* 407
Calathea 347
Calceolaria 313
Calendula 266
Calepina 45
Calla 373
Calliandra 150
Callianthemum 25
Callicarpa 323
Callichlamys 319
Callipeltis 236
Callirhoë 121
Callisia 338
Callistemma 244
Callistemon* 112
Callistephus 257
CALLITRICHACEAE 89

Callitriche 89
Callitris 6
Calluna 215
Calochortus 357
Calodendrum 196
Calonyction 308
Calophaca 163
Calophyllum 115
Calopogonium 172
Caloscordum 357
Calothamnus 111
Caltha 21
Calvoa 114
Calycadenia 251
CALYCANTHACEAE 147
Calycanthus 147
Calycoseris 248
Calystegia 307
Calypso 405
Calythrix 111
Camassia 354
Camelina 41
Camellia 109
Camoensia 169
Campanula* 285, 287
CAMPANULACEAE 287
Campelia 339
Camphorosma 75
Campsis 319
Cananga 15
Canarium 15
Canavalia 171
CANELLACEAE 95
Canistrum 343
Canna 347
CANNABINACEAE 185
Cannabis 185
CANNACEAE 347
Cantua 292
Capillipedium 419
Capnophyllum 211
CAPPARIDACEAE 36
Capparis 36
CAPRIFOLIACEAE 240
Capsella 39
Capsicodendron 95
Capsicum 303
Caragana 164
Caraguata 343
Cardamine* 43
Cardaminopsis 43
Cardaria 39
Cardiocrinum 359
Cardiospermum 197
Carduus 261, 262
Carex* 414
Carica 101
CARICACEAE 101

Carissa 230
Carlina 261
Carludovica 399
Carmichaelia 164
Carnegiea 102
Carpanthea 66
Carpinus 181
Carpobrotus* 66
Carrichtera 46
Carruanthus 66
Carthamus 262
Carum 205
Carya 199
Caryolopha 297
CARYOPHYLLACEAE 60
Caryota 397
Cassia 148
Cassiope 216
Castanea 181
Castanospermum 170
Castelia 324
Castilleja 316
Castilloa 184
Casuarina 182
CASUARINACEAE 182
Catabrosa 439
Catalpa 319
Catananche 250
Catapodium 440
Catesbaea 239
Catharanthus 230
Cattleya* 407
Caucalis 207
Caulanthus 48
Caulophyllum 28
Cayratia 192
Ceanothus* 191
Cecropia 184
Cedrela 197
Cedrus 5
Ceiba 120
CELASTRACEAE 189
Celastrus 189
Celosia 78
Celsia 315
Celtis 182
Cenarrhens 90
Cenchrus 427
Cenia 267
Centaurea* 260
Centaurium 275
Centotheca 457
Centranthus 243
Centrosema 170
Centunculus 280
Cephaelis 237
Cephalandra 100

Cephalanthera 401, 406
Cephalanthus 239
Cephalaria 244
Cephalocereus 105
Cephalophyllum 68
Cephalorrhynchus 250
CEPHALOTAXACEAE 4
Cephalotaxus 4
Cerastium* 60, 61
Ceratonia 149
Ceratopetalum 133
CERATOPHYLLACEAE 26
Ceratophyllum 26
Cerastostigma 281
Ceratotheca 321
Ceratozamia 3
Cerbera 229
CERCIDIPHYLLACEAE 14
Cercidiphyllum 14
Cercis 147
Cercocarpus 142
Cereus* 103
Cerinthe 297
Cerochlamys 66
Ceropegia 231
Cestrum 301
Chaenomeles 144
Chaenorrhinum 309
Chaerophyllum 208
Cheatadelpha 250
Chaeturus 435
Chamaealoe 362
Chamaecyparis 6
Chamaedorea 396
Chamaelaucium 110
Chamaenerion 88
Chamaeorchis 409
Chamaepericlymenum 203
Chamaerops 398, 399
Chamaescilla 365
Chaptalia 271
Chasmanthe 388
Cheiranthus 44
Cheiridopsis 68
Chelidonium 37, 33
Chelone 313
Chenolea 75
CHENOPODIACEAE 75
Chenopodium* 76
Chikusichloa 455
Chilianthus 226
Chilopsis 319
Chimaphila* 216
Chimonanthus 147
Chimonobambusa 457, 458
Chionachne 417

Chionanthus 227
Chionodoxa 354
Chionographis 370
Chirita 318
Chlora 276
CHLORANTHACEAE 30
Chloranthus 30
Chloridion 425
Chloris* 433
Chlorogalum 365
Chlorophytum 365
Chomelia 236
Chondrilla* 247
Chordospartium 164
Chorilaena 195
Chorispora 42
Chrozophora 130
Chrysalidocarpus 396
Chrysamphora 59
Chrysanthemum 267
Chrysobactron 364
Chrysophyllum 225
Chrysopogon 419
Chrysosplenium 58
Cicer 156
Cicerbita 250
Cichorium 250
Ciclospermum 204
Cicuta 206
Cienfugosia 124
Cimicifuga 20
Cinchona 240
Cineraria 262
Cinna 437
Cinnamomum 15
Circaea* 88
Cirsium* 261
Cissus 192
CISTACEAE 96
Cistanche 317
Cistus 93, 96
Citrullus 99
Citrus* 193
Cladanthus 267
Cladium 415
Cladrastis 170
Clappertonia 119
Clarkia 86
Clausena 193
Claytonia 71
Cleistachne 422
Cleistogenes 430
Clematis* 17, 25
Cleome 36, 37
Clerodendron 324
Clethra 215
CLETHRACEAE 215
Clianthus 163

Clinopodium 329
Clintonia 366
Clitoria 170
Clivia 381
Clypeola 42
Clytostoma 319
Cnicus 261
Cnidium 207
Cobaea 292
Coccinia 100
Coccoloba 74
Coccothrinax 398
Cocculus 29
Cochlearia 38
Cochliostema 340
Cocos 396, 397
Codonopsis 287
Coeloglossum 407
Coelogyne 407
Coelorrachis 422
Coffea 237
Coix 417
Cola 120
Colchicum 368
Coleanthus 436
Coleonema 196
Coleotrype 340
Coleus 325
Colletia 191
Colliguaja 129
Collinia 396
Collinsia 309
Collomia 291
Colocasia 374
Columella 192
Colutea 163
Coluteocarpus 38
Colvillea 150
Comarum 139
COMBRETACEAE 114
Commelina 339
COMMELINACEAE 338
Commelinantia 340
Commiphora 197
COMPOSITAE 245
Comptonia 179
Conicosia* 66
Conium 210
Conophyllum 66
Conophytum 69
Conopodium 206
Conospermum 91
Conringia 45
Consolea 102
Convallaria 371
CONVOLVULACEAE 307
Convolvulus 307
Cookia 193

Cooperia 378
Copaifera 149
Copernicia 398

by *C. D. Darlington*
CHROMOSOME BOTANY

Cr. 8vo about 12s. 6d. net

In the last twenty years chromosomes have penetrated into every kind of plant study. In his new book, which he begins with a simple account of chromosome behaviour, Professor Darlington reviews the effects of this penetration on genetics and systematics, ecology, plant geography and plant breeding. The effect of this treatment is in a sense to turn the science upside down. All the various branches of botany are seen from a new angle, and it is not surprising that several unexpected evolutionary principles are brought to light. This is especially true of what concerns the origins of species and the origins of cultivated plants. The book will serve as an introduction to a wide range of biological problems. It is illustrated by 36 drawings, diagrams and maps, mostly unpublished.

by *C. D. Darlington and L. F. La Cour*
THE HANDLING OF CHROMOSOMES

Revised Second Edition. Cr. 8vo. 9s. 6d. now—net

The chromosomes are the machinery of organic inheritance and evolution, the chemical organizers of life. In every plant and animal cell they are continually at work controlling and organizing development. Here for the first time is a simple account of how to make them visible. Darlington and La Cour's work is well known in this field of research. Their book will enable teachers in schools and universities to demonstrate chromosomes to their pupils. It describes every stage of the treatment from dissecting an anther or salivary gland to making a camera lucida drawing or microphotograph. Diagrams, schedules, formulae, bibliography and lists of equipment are provided. This book will be indispensable alike in botany and zoology, medicine and agriculture.

'One of the writers of this book has probably done more than any other living man to increase our knowledge of chromosomes, the other has made useful contributions to the technique of studying them. They have collaborated to the advantage of fellow cytologists in preparing this authoritative account.'—*Lancet*.

'This is more than a manual for students. Research workers will find indications as to when and how more elaborate methods should be used. They will also find a most useful bibliography of recent reviews together with much information, some unpublished hitherto, which has never before been collected in a single volume.'—*British Medical Journal*.

by *C. D. Darlington and K. Mather*

THE ELEMENTS OF GENETICS

Second Impression. Demy 8vo. 30s. net

Genetics has undergone many transformations since it began with the re-discovery of Mendel in 1900. *Drosophila* and the chromosomes, population studies, human heredity and statistical methods, the chemistry of mutations and finally the great revelations of the genetics of micro-organisms have, each of them, meant a revolution in the study of heredity. The last has meant its combination with the study of development and infection also.

The Elements of Genetics by Darlington and Mather represents for the first time the whole length and breadth of this history. It is a concise text book of genetics. But it is written by two workers who in their 15 years' collaboration have done as much as any others to make this new science. It is therefore bound to be a book for the research worker as well as for the student.

There are a great number of new figures, diagrams and tables, and a glossary with the author's definitions of 500 terms gives clarity and precision to the whole work.

'Most stimulating, fascinating for the breadth of its ideas . . . a most important book of lasting value. . . . Packed with information and ideas from which all will profit and it should have the widest of publics.'—*Eugenics Review*.

'Seldom within the confines of a single volume does one find a lucid exposition of a whole discipline. . . . Darlington and Mather understand genetics; they do not merely know it. In this book they have set down in admirably clear language the elements, the ultimate parts of which genetics is made.'—*Biology and Human Affairs*.

by *C. H. Waddington*

AN INTRODUCTION TO MODERN GENETICS

Demy 8vo. Third Impression. about 30s. net.

'In the interests of genetics and of biology as a whole, we hope that Waddington's book will be widely used.' J. B. S. HALDANE, J. S. HUXLEY, H. J. MULLER in *Nature*.

'An enormous mass of information from many different fields, but his presentation of the various investigations is frequently better and more lucid than that of the original authors.'—*Animal Breeding Extracts*.

by C. D. Darlington
THE FACTS OF LIFE

Demy 8vo. 35s. net

This book begins as a history of man's attempts to discover the facts about himself. It goes on to deal in detail with heredity, sex and reproduction, and with their bearing on the great problems of society, with race, class and mating; with education, health and crime; with evolution and the interpretation of history; and with the never-ending war between superstition and scientific method. The conclusion is a philosophy of determinism which is very old so far as the name goes. But the evidence on which Dr. Darlington bases his argument has been brought together only in the last thirty years. The result is therefore in effect a new philosophy of life.

'The vigour of Darlington's thought, and prose, and the combination of a highly individual point of view with a wide field of scientific knowledge, will, I think, cause this book to be quoted for a long time as an important mid-twentieth century opinion about the cultural influence of biology.'—*Heredity*.

'This is a brilliant and stimulating book. The story of the growth of our knowledge and the defeat of our superstitions and prejudices about human reproduction and heredity has never been better told; and the chapters on the social and historical implications of modern genetics are admirably provocative.'—*Dr. Julian Huxley*.

by C. D. Darlington and K. Mather
GENES, PLANTS AND PEOPLE

Demy 8vo. 16s. net

Here is a collection of essays covering a large part of the field of genetics. They announce the generalizations and hypotheses developed over a period of twenty years during which they have served as some of the main signposts in the astonishing advance of this science. They deal with plants and animals, medicine and agriculture. They offer new interpretations of evolution, development and disease. Indeed they sketch out a rigorous framework of causation which is now being applied to the whole of biology.

Scattered in many journals these essays have long been out of reach to the general reader. Now in compact form they serve as an introduction and as a history of the subject which the two authors have presented with more detail in their *Elements of Genetics*.

by Roger Pilkington

SONS AND DAUGHTERS

Demy 8vo. 18s. net

Sons and Daughters tells the story of the development of the human baby from conception to birth and explains the remarkable and complex events of the early stages of development in simple and non-technical language. The present knowledge of human heredity is clearly stated, and there are sections dealing with the effects of the environment upon characters controlled by genes, the possibility of inducing mutations chemically, and the accuracy with which genetic forecasting of a child's talents and physical features can be done. There are scores of photographs of unusual excellence, and the work is written with a lively humour which marks it as a book of outstanding merit.

'We follow with absorbed interest the growth of the human baby from conception to birth and learn of the remarkable events in the early stages of its development. The factors which determine the physical, mental and emotional entity which is a human being are clearly outlined and the degree to which these can be predicted examined. . . . It brings to a difficult yet momentous subject the illuminating power of a lively enquiring mind.'—*School Government Chronicle*.

by Julian Huxley

EVOLUTION : THE MODERN SYNTHESIS

Fifth Impression. Demy 8vo. 25s. net

It is proclaimed in some quarters that Darwinism is dead. This book by Professor Julian Huxley completely refutes the assertion. Owing to a combination of historical accidents Darwinism suffered an eclipse in the early years of this century: but recent progress in various fields has led to a new synthesis of biological knowledge, which has made it evident that the Darwinian principle of Natural Selection must still be regarded as the main factor in evolutionary change, although recent developments in our knowledge of hereditary constitution have shed new light on the precise method of its operation.

The author deals at some length with these modern developments of Mendelism and their bearings on Evolution, and discusses the general problems of adaptation. A large section of the book is devoted to the various methods by which new species may be formed. In these chapters, data from Systematic zoology and botany and from field natural history have been analysed in the light of modern genetic and evolutionary theory on a scale not hitherto attempted.

' . . . most important book. . . . Dr. Huxley presents a fascinating and extremely complex picture of that fascinating and extremely complex thing called living nature, painted in genes. His picture is essentially dynamic.'—*New Statesman and Nation*.

' . . . there is certainly no more complete and no more satisfactory work on evolution.'

Times Literary Supplement.
