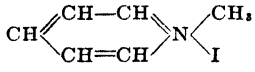
acid. **1.4-** Isocinchomeronic acid. **1.5-** Dipicolinic acid. **2.3-** Cinchomeronic acid. **2.4-** Dinicotinic acid. **p. pentacarboxylic acid.** $C_{10}H_5O_{10}N$ = 299.10. $C_5N(COOH)_5$, +2- or $3H_2O$. A soluble acid, decomp. 220. **p. sulfonic acid.** $C_5H_4NSO_3H$ = 159.1. Colorless needles, soluble in water, alcohol or ether; used in organic synthesis. **p. thiocyanate reaction.** The production of a precipitate by certain metals (*e.g.*, Zn, Ni, Co) in the presence of pyridine and ammonium thiocyanate; used in gravimetric and microanalysis. **p. tricarboxylic acid.** $C_5H_2N(COOH)_3.2H_2O$ = 247.12. **1.2.3.4-** Carbo*cinchomeronic acid.* **1.-3.4.5-** Berberonic acid. **1.2.4.5-** m.235. **1.2.4.6-** m.227 (decomp.). **1.2.3.5-** m.323. **1.2.3.6-** m.71, b.130.

pyridinium. A series of compounds derived from pyridine, in which the heterocyclic nitrogen atom is pentavalent; *e.g.*,



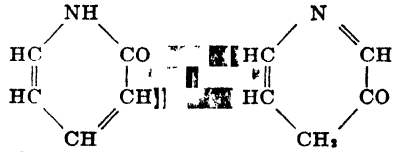
Cf. *piperidinium.*

pyridium. Phenyl-azo-diamino pyridine. A urinary antiseptic.

pyridol. Hydroxypyridine. The hydroxy-form of pyridone,

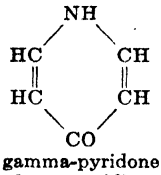
$$HO.C_5H_4N \rightarrow O:C_5H_5N.$$

pyridone. C_5H_5ON = 95.1. Ketopyridine, oxypyridine, pyridol; a group of heterocyclic ketones or quinones:



alpha-pyridone
1-oxy-pyridine
m.106
b.281

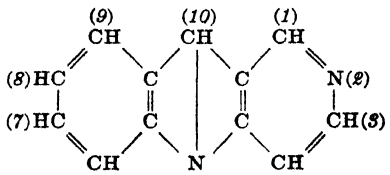
beta-pyridone
2-oxy-pyridine
m.124



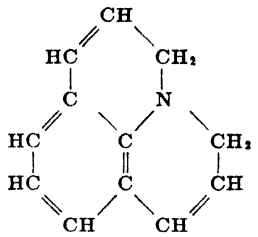
gamma-pyridone
3-oxy-pyridine
m.148

pyridopyridine. $C_8H_6N_2$ = 130.06. 1.5-Naphthyridine, 1.5-benzodiazine, q.v. An isomer of cinnoline, quinazoline and quinoxaline.

pyridoquinoline. $C_{12}H_8N_2$ = 180.1; and $C_{12}H_{11}N$ = 169.1. A group of heterocyclic compounds containing one or two nitrogen atoms and consisting of a quinoline and pyridine ring fused together, as



2.5-pyridoquinoline ($C_{12}H_8N_2$)

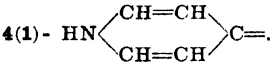


4.3.5-pyridoquinoline ($C_{12}H_{11}N$)

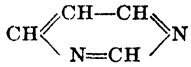
pyridoxine. Adermin, vitamin B_6. 2-Methyl-3-hydroxy-4,5-di(hydroxymethyl) pyridine. Its need in human nutrition has not been established. **p. hydrochloride.** The commercially-available form of pyridoxine.

pyridyl. The monovalent radical, C_5H_4N—, derived from pyridine. It is **c-pyridyl, if** substitution has taken place on the carbon atom of the ring; or **n-pyridyl, if** substitution has taken place on the nitrogen atom of the ring. **ter-** q.v. **p. amine.** Aminopyridine.

pyridylidene. The bivalent radical C_5H_5N=, derived from pyridine; as,



pyrimidine. $C_4H_4N_2$ = 80.047. 1.3- or *m*-diazine, q.v., metadiazine, miazine,

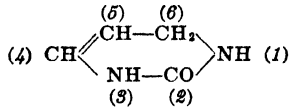


An isomer of pyrazine and pyridazine. Colorless crystals of pungent odor, m.22, b.124; soluble in water, alcohol, or ether. **dihydroketo-** Pyrimidone. **2.6-dioxy-** Uracil. **methyldioxy-** Thymine. **2-oxy-6-amino-** Cytosine. **2.4.6-trioxy-** See *barbituric acid.*

p. bases. Compounds in nucleo proteins: dioxy-, uracil; methyldioxy-, thymine; oxyamino-, cytosine; tetraoxy-, alloxan; trioxy-, barbituric acid.

p. dione. Uracil. **p. tetrone.** Alloxan. **p. trione.** Barbituric acid.

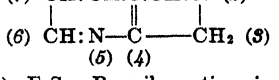
pyrimidone. $C_4H_6N_2O$ = 98.06. Dihydroketopyrimidine.



4-amino- Cytosine.

pyrimidyl. The monovalent radical, $C_4H_3N_2$—, derived from pyrimidine.

pyrindol. $C_7H_6N_2$ = 118.1. *2.4*-Pyrrolopyridine. The heterocyclic compound:



pyrite. (1) FeS_2. Brassil, native iron sulfide. Yellow, shining crystals, commonly known as fool's gold. (2) Native iron sulfide.

pyrites. A generic name for a group of sulfide minerals; as, iron pyrites FeS_2, copper-pyrite or chalcopyrite, tin-pyrite or stannite. **arsenical-** Mispickel. **arseno-** Arsenopyrite. **auriferous-** A p. containing gold. **capillary-**

Millerite. **cobalt-** Smaltite. **copper-** The yellow ore, $CuFeS_2$. **coxcomb-** Marcasite. **iron-** Pyrite. **magnetic-** Pyrrhotite. **nickel-** Millerite. **radiated-** Marcasite. **spear-** Marcasite. **tin-** Stannite. **white iron-** Marcasite.

pyro- (1) Pyr- A prefix derived from the Greek, which indicates a connection with heat or fire; as pyroligneous acid, pyrometer. (2) Pyroxylin.

pyroacetic acid. Crude acetic acid made from wood distillation products. **p. spirit.** Acetone.

pyroacid. An acid produced by the loss of 1 mol. of H_2O from 2 mol. of an orthoacid (q.v.), *e.g.*, by heat. Cf. *pyroarsenic, pyrophosphoric acids.*

pyroantimonate. Any salt derived from pyroantimonic acid; as, $K_2H_2Sb_2O_7$, acid potassium pyroantimonate.

pyroantimonic acid. The hypothetical acid, $H_4Sb_2O_7$. Its sodium salt is insoluble.

pyroarsenate. A salt of pyroarsenic acid.

pyroarsenic acid. $H_4As_2O_7$ = 266.1. Diarsenous acid, $As_2O_3(OH)_4$. A tetrabasic acid obtained by heating arsenic acid to 180°C.

pyrobitumen. A constituent of shale oil; converted into bitumen by heat.

pyroborate. A salt derived from pyroboric acid as, borax, $Na_2B_4O_7$.

pyroboric acid. The dibasic acid, $H_2B_4O_7$.

pyrocatechin. Pyrocatechol.

pyrocatechoic acid. *2.3*-Dihydroxybenzoic acid.

pyrocatechol. (1) $C_6H_6O_2$ = 110.08. Catechol, pyrocatechin, *o*-dihydroxy-benzene, 2-hydroxyphenol, *1.2*-benzenediol*. Colorless leaflets, d.1.344, m.105, b.245, soluble in water, alcohol, or ether. Used as an antiseptic and antipyretic, as a developer in photography, and as a weak reducing agent. Cf. *resorcinol, hydroquinol.* (2) Protocatechols. A group of diatomic phenols derived from catechol; as, homopyrocatechol, $C_6H_3Me(OH)_2$.

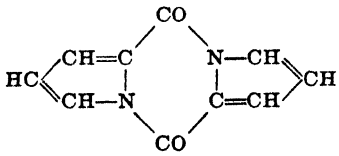
pyrocatechu aldehyde. $C_7H_6O_3$ = 138.05. **o-.** *2.3*-Dihydroxybenzaldehyde, $(HO)_2C_6H_3.CHO$. White crystals, m.108, b.235, used in organic synthesis.

pyrochlore. The blue, vitreous mineral, $(CaFe, Ce)O,(Nb,Ti,Th)O_2,H_2O$.

pyrochroite. An amorphous native manganous hydroxide, $Mn(OH)_2$.

pyrochromate. Dichromate.

pyrocoll. $C_{10}H_8O_2N_2$ = 186.2. An anhydride of pyrrole carboxylic acid.



Yellow leaflets, m.269; insoluble in water, soluble in alcohol or ether.

pyrocomane. 1.4-Pyrone.

pyrocondensation. A union of molecules brought about by heat; as, the formation of biuret from urea.

pyrodextrin. A brown tasteless decomposition-product of starch, obtained by heat.

pyrodin. $C_8H_{10}ON_2$ = 150.2. Hydracetin, phenacethydrazine, acetylphenylhydrazine, $PhNH.NH.OCMe$. A colorless crystalline powder m.130, soluble in alcohol, slightly soluble in ether or water; used medicinally as an antipyretic, and analgesic.

pyroelectricity. Thermal deformation. A thermoelectric phenomenon, shown by crystals which become electrically charged if heated.

pyrogallate. Any salt or ether of pyrogallol.

pyrogallic acid. Pyrogallol.

pyrogallol. $C_6H_6O_3$ = 126.1. Pyrogallic acid, 1.2.3-trihydroxybenzene, *1.2.3*-benzenetriol.* A light, white odorless, powder, needles or leaflets $d._{40}°1.463$, m.133, decomp. 293; very soluble in water, alcohol, or ether. Used as a reagent, chiefly to absorb oxygen, as a weak reducing agent, as a photographic developer; and medicinally, as an antiparasitic. **acetyl-** Gallacetophenone. **methylmethoxy-** Iridol. **propyl-*p*-dimethyl-** Picamar. **trimethoxy-** $C_6H_3(OMe)_3$ = 168.1. Pyrogallol trimethyl ether. A colorless crystalline powder, m.47, b.235; soluble in alcohol or ether.

p. carboxylic acid. *2.3.4*-Trihydroxybenzoic acid. **p. monoacetate.** $C_9H_8O_4$ = 168.1. Eugallol, $CH_3COO.C_6H_3(OH)_2$. A thick, dark-yellow, syrupy liquid, readily soluble in water; used medicinally for skin diseases. **p. phthalein.** Gallein. **p. salicylate.** Saligallol. **p. triacetate.** $C_{12}H_{12}O_6$ = 252.1. Lenigallol, $(CH_3COO)_3C_6H_3$. A white, insoluble powder, used as an antiseptic.

pyrogen. Any foreign substance in a medicinal injected into the blood stream which produces fever.

pyrogen dyes. Sulfur dyes.

pyrogenic. A reaction that occurs only at a high temperature; a reaction induced by heat.

pyrographitic oxide. $C_{22}H_2O_4$ = 330.02. A fine black powder produced by heating graphitic acid.

pyrokomane. 1.4-Pyrone.

pyroligneous. Pertaining to the distillation of wood. **p. acid.** Wood vinegar. Pyracetic acid. Impure acetic acid obtained by the destructive distillation of pine tar and wood. **p. alcohol.** Methanol. **p. spirit.** Methanol.

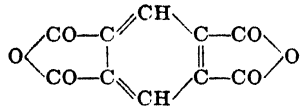
pyrolusite. MnO_2. Polianite. A native manganese dioxide, Cf. *psilomelane.*

pyrolysis. The decomposition of organic substances by heat.

pyrolythic acid. Cyanuric acid.

pyromagnetic. Pertaining to heat and magnetism.

pyromellitic acid. $C_{10}H_6O_8.H_2O$ = 272.12. Benzene-1.2.4.5-tetracarboxylic acid.* $C_6H_2(COOH)_4$. Colorless triclinic tablets, m.275, soluble in water or alcohol. Cf. *mellophanic, prehnitic acids.* **p. anhydride.** $C_{10}H_2O_6$ = 218.0. The heterocyclic compound,



pyrometallurgy. That branch of metallurgy requiring heat treatment.

pyrometer. An instrument for measuring high temperatures (generally above 500°C.) by mechanical, electrical or optical means. Cf. *thermometer, thermocouple.* Methods:

(a) *mechanical* thermocouples—which record temperature through a system of levers that magnify the stress or distortion of two joined metal strips.

(b) *electrical* thermocouples—which indicate the temperature by measuring the current produced in a metal-metal junction, with a sensitive millivolt-meter.

(c) *resistance* thermometers—which record temperature by measuring the change in resistance of a conductor exposed to the heat.

(d) *optical* pyrometers—which measure the quality and intensity of the light emitted from a hot body or glowing material by comparison with some standard source of light.

(e) *radiation* pyrometers—which measure the heat radiated by a hot body, usually by a thermocouple.

pyrometric. Pertaining to high temperature. **p. cone.** Seger cone. **p. gage.** See *gage*.

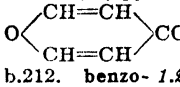
pyrometry. A branch of physics dealing with the measurement of high temperatures.

pyromorphite. $3Pb_3(PO_4)_2.PbCl_2$. Green lead ore, a native chlorophosphate of lead, of the apatite group.

pyromucic acid. $C_4H_3O.COOH$ = 112.1. Furan-2-carboxylic acid, furoic acid. Colorless monoclinic crystals, m.132, slightly soluble in water, soluble in alcohol or ether; used in the manufacture of *furoates*. β- Fucusoic acid.

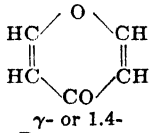
pyromucyl. 2-Furoyl. The monovalent radical, O.CH:CH.CH:C.CO—, derived from pyromucic acid. Cf. *furoyl*. **bi-** Furil. **p. chloride.** $C_4H_3O.COCl$ = 130.48. Furoyl chloride, 2-furan carbonyl chloride. A colorless liquid, m.0, b.60.

pyrone. $C_5H_4O_2$ = 96.1. Pyrocomane, pyrokomane, γ-pyrone. An isomer of coumalin,

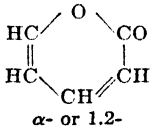


Colorless crystals, m.32, b.212. **benzo-** *1.2-* Coumarin. *1.4-* Chroman. **dibenzo-** Xanthone. **hydroxy-** Kojic acid. **p. α- carboxylic acid** $C_5H_3O_2.COOH$ = 140.06. Komanic acid. A soluble solid, derived from chelidonic acid, decomp. 250. **p. dicarboxylic acid.** Chelidonic acid.

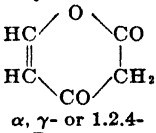
pyrones. A series of heterocyclic compounds derived from alpha- or gamma-pyrone, which occur in numerous natural coloring materials, and in synthetic dyes and drugs. They are derived from:



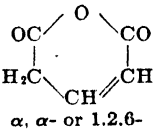
γ- or 1.4- Pyrocomane



α- or 1.2- Coumalin



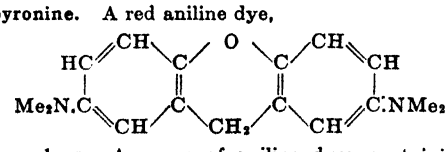
α, γ- or 1.2.4- Pyronone



α, α- or 1.2.6- Glutaconic anhydride.

benzo- Chromones. **dibenzo-** Xanthones.

pyronine. A red aniline dye,



p. dyes. A group of aniline dyes containing the chromophore, =R  R=.

pyronone. $C_5H_4O_2$ = 112.0. α,γ-pyrone. An isomer of glutaconic anhydride; see *pyrones*. **methylaceto-** Dehydracetic acid.

pyrope. An aluminum garnet, q.v.

pyrophore. A carrier of fire; as, pyrophoric.

pyrophoric. Producing sparks when filed or rubbed, or burning spontaneously in air, *e.g.*, finely-divided metals or alloys. **p. alloy.** A chromium-iron-cerium alloy, used in mechanical gas lighters. **p. lead.** The pyrophoric lead-carbon mixture obtained on heating lead tartrate. **p. reaction.** A reaction that causes flame; *e.g.*, $KMnO_4$ and H_2SO_4 placed in a beaker will set fire to filter paper.

pyrophorus. Having pyrophoric properties.

pyrophosphate. A salt of pyrophosphoric acid; as, $M_4P_2O_7$, $M_2H_2P_2O_7$.

pyrophosphite. A salt of pyrophosphorous acid: as, $M_4P_2O_6$, $M_2H_2P_2O_6$.

pyrophosphoric acid. $H_4P_2O_7$ = 178.1. A tetrabasic acid; colorless crystals, m.61, soluble in water.

pyrophosphorous acid. $H_4P_2O_5$ = 146.03. A tetra-basic acid of trivalent phosphorous. Colorless needles, m.38; soluble in water (decomp.).

pyrophosphoryl. The tetravalent radical $\equiv P_2O_3$, derived from pyrophosphoric acid. **p. chloride.** $P_2O_3Cl_4$ = 251.86. $(Cl_2PO)_2O$. A colorless fuming liquid b.250; hydrolyzed by water to orthophosphoric acid and hydrochloric acid.

pyrophyllite. The mineral $Al_2O_3.4SiO_2.H_2O$, resembling talc and montmorillonite. Used as filler for paper, paint, rubber and textiles; as a polishing agent for foods (rice, peanuts, etc.); in lubricants and toilet preparations. Cf. *image stone*.

pyroracemamide. $C_3H_5O_2N$ = 87.1. The amide of pyroracemic acid, $Me.CO.CO.NH_2$. A colorless crystalline powder, m.124.

pyroracemic acid. Pyruvic acid.

pyroracemic aldehyde. Pyruvic aldehyde.

pyrosal. Salipyrine.

pyrosine. Erythrosin.

pyrostilbnite. Kermesite.

pyrosulfate. A salt of pyrosulfuric acid; as, $M_2S_2O_7$, or MHS_2O_7.

pyrosulfuric acid. $H_2S_2O_7$ = 178.0. Disulfuric acid. A fuming crystalline substance obtained by freezing Nordhausen acid.

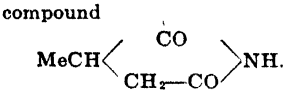
pyrosulfuryl. The divalent radical $=S_2O_5$, derived from pyrosulfuric acid. **p. chloride.** $S_2O_5Cl_2$ = 215.06. Sulfur pentoxy dichloride. The chloride of pyrosulfuric acid. A heavy, mobile, fuming liquid, d1.844, $b._{730mm}$ 150.7; hydrolyzed by water to H_2SO_4 and HCl.

pyrotartaraldehyde. $C_5H_8O_2$ = 100.06. Methylsuccinaldehyde, $CHO.CH_2.CHMe.CHO$. Colorless crystals.

pyrotartaric acid. $C_5H_8O_4$ = 132.1. Methyl succinic acid, methylbutanedioic acid,* pyrovinic acid. A dibasic acid, $MeCH(COOH)CH_2COOH$. Colorless, triclinic crystals, d.1.411, m.112; soluble in water, alcohol or ether. For isomers see *ethylmalonic acid*. *n-* Glutaric acid. **hydroxy-** Citramalic acid. **p. aldehyde.** Pyrotartaraldehyde.

pyrotartrate. A salt of pyrotartaric acid.

pyrotartrimide. $C_5H_7O_2N$ = 113.7. The heterocyclic compound



A colorless crystalline powder, m.66.

pyrotechnics. The production and manufacture of fireworks.

pyroterebic acid. $C_6H_{10}O_2$ = 114.08. *4*-methyl-*2*-pentenoic acid,* $Me_2C{:}CH.CH_2COOH$. Colorless crystals, m.207.

pyrothioarsenate. A compound of the type, $M_4As_2S_7$.

pyrotritaric acid. Uvic acid.

pyrouric acid. Cyanuric acid.

pyrovanadic acid. The tetrabasic acid $H_4V_2O_7$. Cf. *vanadic acid.*

pyrovinic acid. Pyrotartaric acid.

pyroxene. $CaO,MgO,2SiO_2$. A white, dark green or black silicate, which may contain iron or chromium.

pyroxenite. Websterite.

pyroxylic spirit. Methanol.

pyroxylin. Pyroxylinum, soluble gun cotton, collodion cotton, trinitrocellulose, collodium, colloxylin. A group of substances obtained by nitrating cellulose and dissolving in a solvent of high boiling point, which consists of cellulose trinitrate, $C_6H_7O_5(NO_3)_3$, and tetranitrates, $C_6H_6O_5(NO_3)_4$. Used medicinally for artificial skin-covering, collodion, and in the manufacture of artificial silk, leather, oil cloth, and varnishes. See *rayon.*

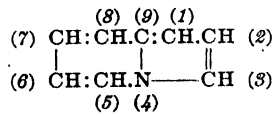
pyrrhosiderite. Göthite.

pyrrhotine. Pyrrhotite.

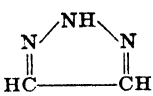
pyrrhotite. FeS. Pyrrhotine. Magnetic pyrite. A magnetic iron sulfide, which usually contains nickel.

pyrrilium. Pyrylium.

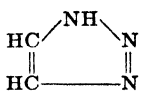
pyrrocoline. C_8H_7N = 117.1. *8*-pyrrolopyridine. The heterocyclic compound



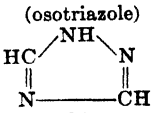
pyrrodiazole. $C_2H_3N_3$ = 69.1. A group of pentatomic triazoles:



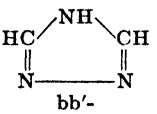
aa'-
1.2.5-
(osotriazole)



ab-
1.2.3-

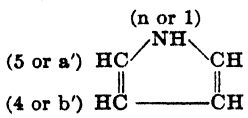


ab'-
1.2.4-



bb'-
1.3.4-

pyrrole.* C_4H_5N = 67.1. Azole. The heterocyclic ring compound,



A colorless liquid, $d_{20°}$0.9481, b.130, insoluble in water, and soluble in alcohol or ether. It is a constituent of bone oil, and its derivatives are used as antiseptics. Cf. *porphin ring.* **cyan-** See *cyanopyrrole.* **dibenzo-** Carbazole. **dihydro-** Pyrroline.* **dimethylethyl-** Kryptopyrrole. **tetrahydro-** Pyrrolidine.*

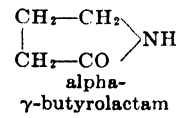
p. α-carboxylic acid. $C_4H_4N.COOH$ = 111.08. A solid, decomp. 191, soluble in water, alcohol or ether.

pyrrolidine.* C_4H_9N = 71.1. Pentazane, butylene imide, tetramethyleneimine, tetrahydropyrrole,  . The base of proline and some alkaloids. A colorless liquid, d.0.852, b.88; soluble in water, alcohol or ether. **keto-** Pyrrolidone. **methyldiketo-** Succinimide. **pyridyl methyl-** Nicotine.

p. alkaloids. See *nicotine group.* **p. carboxylic acid.*** Proline. **p. dione.*** Succinimide.

pyrrolidinium. A derivative of pyrrolidine contain pentavalent nitrogen. Cf. *piperidinium.*

pyrrolidone. C_4H_7O = 71.1. A group of ketopyrrolidines,

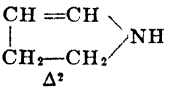


alpha-
γ-butyrolactam

beta-

pyrrolidyl. The monovalent radical, C_4H_8N—, derived from pyrrolidine.

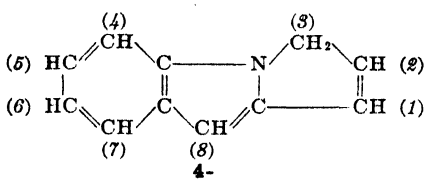
pyrroline*. C_4H_7N = 69.1. Dihydropyrrole,



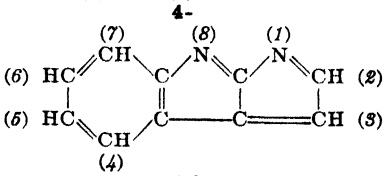
A colorless liquid, $d_{20°}$.0.910, b.90; very soluble in water, alcohol or ether.

pyrrolinium. A derivative of pyrroline containing pentavalent nitrogen. Cf. *piperidinium.*

pyrroloindole. $C_{11}H_9N$ = 155.1 and $C_{10}H_8N_2$ = 154.0. A compound with a fused pyrrole and indole nucleus; hence consisting of a benzene-ring and two pyrrole rings. There are *e.g.:*



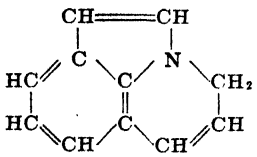
4-



1.8-

pyrrolopyridine. $C_7H_6N_2$ or C_8H_7N. A compound with a fused hexa- and pentatomic ring, each of which has one nitrogen; thus **2.4-** Pyrindole. **8-** Pyrrocoline.

pyrroloquinoline. (1) $C_{11}H_9N$ = 155.1. The heterocyclic compound:

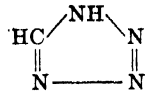


(2) Any tricyclic system containing a quinoline and a pyrrole ring.

pyrrolylene. Bivinyl.

pyrromonazole. **alpha-** Pyrazole. **beta-** Glyoxaline.

pyrrotriazole. CH_2N_4 = 70.2. The pentatomic tetrazole:



A colorless crystalline powder, m.156.

pyrroyl. The monovalent radical,

derived from pyrrole carboxylic acid.

pyrryl. The monovalent radical, C_4H_4N—, derived from pyrrole. **C-** If the substituting radical is attached to a carbon atom. **N-** If the substituting radical is attached to the nitrogen atom. **p. methyl ketone.** C_6H_7ON = 109.1. **alpha-** $C_4H_4N.CO.Me$. Colorless crystals, m.90, b.200.

pyruric acid. Cyanuric acid.

pyruvaldehyde. Pyruvic aldehyde.

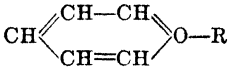
pyruvic acid. $C_3H_4O_3$ = 88.1. Pyroracemic acid, keto-acetic acid, acetylformic acid, *2*-oxopropanoic acid*, Me.CO.COOH or *2*-hydroxy propenoic acid*, α-hydroxyacrylic acid, CH_2:-COH.COOH. A colorless crystalline powder or liquid, d.1.288. m.13.6, b.165 (decomp.), soluble in alcohol, water or ether. It is a distillation-product of racemic acid or ether, and is an intermediate product in the metabolism of proteins, fats and carbohydrates.

pyruvic aldehyde. $C_3H_4O_2$ = 72.1. Pyroracemic aldehyde, ketoacetaldehyde, acetylformyl, methyl glyoxal, propanolon, propanedione pyruvaldehyde, *2*-oxopropanal*. MeCO.CHO.

pyruvonitrile. CH_3COCN = 69.03. Acetylcyanide, 2-oxopropanenitrile*. A colorless liquid, b.93, decomp. in water.

pyrvolidine. An alkaloid from the leaves of the wild carrot, *Daucus carota*, an umbelliferous plant.

pyrylium. Describing a series of compounds derived from pyran, in which the oxygen atom is supposed to be tetravalent:



pyx. (1) Trial of the pyx. The periodical testing of coins issued by the British Mint. (2) Pix. **p. liquida.** Wood tar.

Q

Q. (1) Describing the seventh and outermost shell or orbit of electrons in the atom. Cf. *periodic system.* (2) Symbol for quantity of electricity.

q. Symbol for heat entering a system.

q.v. quod vide (which see).

qt. An abbreviation for quart.

Qu. Abbreviation for quinine.

quadrant. (1) The quarter of a circle; an arc of 90 degrees. (2) The distance from the pole to the equator = 10^7 meters or one-quarter meridian. (3) See *Henry.*

quadratic. A cubical, tetragonal-shaped crystal. Cf. *crystal systems.*

quadri- A prefix from the Latin, indicating four or fourfold (also *tetra-*).

quadribasic. Describing a compound that has four hydrogen atoms replaceable by a base or metal; as, H_4SiO_4. **q. acid.** An acid whose molecules require four molecules of a monatomic base for its neutralization.

quadrilateral. Describing a four-sided figure.

quadrimolecular. Pertaining to four molecules. **q. reaction.** A reaction in which four similar molecules react with one another.

quadrivalent. Having four different valencies; as, bromine with a valency of 1, 3, 5, and 7. Cf. *tetravalent.*

quadroxalate. An obsolete term for bioxalate, or salt of the type, MOOC.COOH.

quadroxide. A binary compound of oxygen that contains four oxygen atoms.

quadruple point. The temperature at which four phases are in equilibrium; *e.g.*, a saturated solution containing excess of salt, (phases: a solid, solvent, solution, and vapor). Cf. *triple point.*

quaker buttons. Nux vomica.

qualitative. Pertaining to the kind or type. **q. analysis.** The methods and procedures by which the constituents of a substance are detected. **q. reaction.** A reaction that detects a substance in a mixture of substances.

quality. The degree of purity of a substance. In general this can be classified as:

C.P. = Chemically pure, tested, analyzed.

U.S.P. or B.P. = Conforming to the tests of the respective pharmacopoeia.

A.R. = analytical reagent. Suitable for use in analysis.

pure = An ordinary commercial grade.

technical = A somewhat impure grade.

crude = An unrefined grade.

quanta. Plural for quantum, q.v.

quantitative. Pertaining to the amount or percentage. **q. analysis.** The methods and procedures by which the amount of a constituent in a material is determined. **q. reaction.** (1) A reaction that determines the amount of a substance in a mixture of substances. (2) A reaction that proceeds almost to completion.

quantity. The amount, active mass, or concentration of a substance; usually expressed in gram-molecules per liter. **physical-** The magnitude or numerical value of a phenomenon. They fall into two classes: *Extensive* magnitudes, when the quantity has an additive effect; as, mass, volume, entropy. *Intensive* magnitudes, when the quantities added increase the intensity of the effect; as, temperature, density, magnetic permeability.

q. of electricity. The amount of electricity required to produce at unit distance (1 cm.) a repulsion of unit force (1 dyne) in a vacuum. This quantity corresponds with 1 international coulomb = 1/3600 ampere-hours = 1/96500 faraday = 3×10^9 electrostatic units.

quantivalence. The combining power or strength of an element or radical, expressed in terms of the number of hydrogen atoms with which it will unite (see *valence*).

quantivalent. Describing an atom that can combine with two or more hydrogen atoms. Cf. *multivalent.*

quantization. A change from a normal atom to an excited atom; that is, electrons in the normal energy level are raised to a higher energy level by the absorption of energy. *E.g.*, C in the normal state has electrons $2s^22p^{33}P$ but 1.6 volts excites it to the state $2s2p^{35}S$. Cf. *quantum notation.*

quantum. Plural: quanta. Ergon. A unit amount of energy, ϵ, set free or bound during the emission or absorption of radiations. It is proportional to ν, the atomic frequency number of the radiation, and is given by the simple relation $\epsilon = h\nu$, where h is Planck's constant, 6.55×10^{-27} erg-seconds. The following relations exist: $\epsilon = hc/\lambda$, where λ is the wavelength of the radiation involved; and $p = h/\lambda$, where p is the momentum of the guided particle. Cf. *orbit, energy level.* This interaction between material particles and radiant quanta is shown by the following phenomena:

1. *Photoelectric effect:* the incident qu. are wholly absorbed; some tear an electron from the atom, others appear as the kinetic energy of the electron.
2. *Fluorescence:* some increase the energy level of electrons; some increase the thermal energy, which is re-emitted as qu. of lower frequency.
3. *Compton effect:* The qu. encounters a free electron, shoots it out with a definite velocity, and is itself re-radiated at lower frequency.
4. *Raman effect:* The qu. alters the energy of the system and is re-radiated at a different frequency (resulting in an absorption spectrum).

See *scattering, shift.*

q. efficiency. The number of molecules transformed in a photolytic reaction per quantum of actinic light absorbed. **q. group.** A number which defines spectroscopic terms, and represents a resultant of the orbital numbers of an atom. Cf. *Stoner quanta.* **q. mechanics.** See *wave mechanics.* **q. notation.** The normal energy levels are indicated by a quantum number (*see table*), and a given spectrum line is indicated by the change from one energy level

QUANTUM NUMBERS AND ENERGY LEVELS

(1)	(2)	(3)	(4)	(5)
K	K	1(1, 1)	K	H 1^2S_1
L_3	L_I	2(1, 1)	L_{11}	Li 2^2S_1
L_2	L_{II}	2(2, 1)	L_{21}	Li 2^2P_1
L_1	L_{III}	2(2, 2)	L_{22}	Li 2^2P_2
M_5	M_I	3(1, 1)	M_{11}	Na 3^2S_1
M_4	M_{II}	3(2, 1)	M_{21}	Na 3^2P_1
M_3	M_{III}	3(2, 2)	M_{22}	Na 3^2P_2
M_2	M_{IV}	3(3, 2)	M_{32}	Na 3^2D_2
M_1	M_V	3(3, 3)	M_{33}	Na 3^2D_3

Q	Q	7(1, 1)	Q_{11}	87 7^2S_1

(1) *Siegbahn, 1918:* Subscripts are in inverse order of intensity; 1 indicates the sub-series of most intense emission, and of lowest frequency.

(2) *Bohr and Coster, 1924,* "letter system": Subscripts denote the order in which the energy levels are filled in the sequence of atomic numbers.

(3) *Bohr and Coster, 1923, "number system":* The number outside the parenthesis is the *total* quantum number; the first of the two numbers in parenthesis is the *azimuthal*, and the second the *inner* quantum number.

(4) *Sommerfeld, 1924:* The *azimuthal* and *inner* quantum numbers are the subscripts.

(5) *Russell and Saunders "alkali-series term system":* Indicates the optical term into which each x-ray term probably merges when reduced to the alkali metal of the period to which an element belongs. Read "two doublet S one" "two doublet P one" etc.

(Adapted from International Critical Tables, vol. VI, 1929.)

to another, thus K-L_{22} or L_{22}-M_{33}. Generally Greek letters are used to indicate the intensity of the lines, the strongest line being α_1 thus (cf. tables):

	Intensity
$K\alpha_1$ due to K-L_{22}	100
$K\alpha_2$ due to K-L_{21}	50
$K\beta$ due to K-M_{21}	35
$K\nu$ due to K-$N_{21,22}$	15

q. number. The integer n, which indicates the energy level of the electron orbit or the number of quanta: $n = E/h\nu$, where E is the total radiation. Cf. *Bohr's atom, Rydberg's equation, hydrogen atom.* **q. relation.** Let λ be the wavelength in ÅU., ν the frequency ($\times 10^{12}$ per second), $h\nu$ the quantum per molecule ($\times 10^{-12}$ erg); then Q, the quantum energy of one mol matter in Kg. cal. ($9.06 \times 10^{23}\ h\nu$) is numerically:

	λ	ν	$h\nu$	Q
red	7500	400	2.62	37.8
yellow	5900	508	3.33	48.6
blue	4900	612	4.01	57.9
violet	4550	659	4.32	62.3
ultraviolet	3950	759	4.97	71.8
ultraviolet	2000	1500	9.9	142

q. state. See *energy levels.* **q. theory.** Energy changes take place in pulsations, not gradually, and always in multiples of a definite quantity, the quantum of energy, ϵ. The mathematical treatment of this concept follows three forms: (a) Matrix theory, *q.v.*, of Born, Heisenberg and Jordan. (b) Wave mechanics, q.v., of Schrödinger, *q.v.*, de Broglie, etc. (c) Transformation theory, *q.v.*, of Dirac, and Jordan. **q. unit.** Planck's constant.

quarentoxide. An oxide of a divalent metal of the type, M_4O; as, Cu_4O.

quarry. An open or surface working for minerals, as building stone, clay, slate, or limestone. Cf. *mine, outcrop.*

quart. Qt. The fourth part of a gallon:
1 quart = 0.946333 liters = 57.75 cubic inches = 2 pints.
dry- The equivalent of 1.1012 liter. **imperial-** The equivalent of 1.13586 liter or 69.3185 cubic inches; 2.5 lbs. of distilled water occupy 1 quart. **liquid-** The equivalent of 0.946 liter.

quartation. Inquartation. The separation or "parting" of silver from gold by dissolving the silver in nitric acid. This separation is quantitative when the alloy contains ¼ gold and ¾ silver and, if necessary, sufficient silver must be added to the alloy before the separation can be made.

quarter. (1) One-fourth part. (2) An English measure of capacity, generally used for grain. It contains 8 bushels. **q. wave plate.** A plate of transparent material (*e.g.*, mica) used in petrological determinations of refractive index; so-called because it produces a phase-difference of ¼ of a wave-length of light between the two emergent beams.

quartering. A method of sampling coal or similar products by dividing a heap of it into approximately equal quarters, mixing opposite quarters, re-dividing the mixture into quarters, and continuing these operations until a sample of suitable size results.

quartile. See *frequency.*

quartz. Silicon dioxide, silica. A glassy and sometimes well crystallized form of silica, SiO_2 which occurs as quartz, rock crystal, amethyst, citrine, and smoky quartz, or in massive forms in veins, as rose or milky quartz. When pure, native quartz occurs in colorless hexagonal crystals, d.2.66, hardness 7, mean refractive [redacted] 573°C index 1.55. It occurs in two forms $\alpha \rightleftharpoons \beta$, is stable at any temperature below 870°C., and above 1200°C. changes to cristobalite. See

QUANTUM RELATION OF RADIATION AND ENERGY

Type	Wavelength λ in Å.U.	Wavenumber per cm.	Frequency ν per sec.	Erg per quantum $h\nu$	Cal. per einstein $Nh\nu$	Electron volts EV
	(1)	(2)	(3)	(4)	(5)	(6)
x-rays	1	1×10^8	3×10^{18}	1.96×10^{-8}	2.84×10^8	12,337
	10	1×10^7	3×10^{17}	1.96×10^{-9}	2.84×10^7	1,234
	12.3	8×10^6	2.7×10^{17}	1.59×10^{-9}	2.5×10^6	1,000
	100	1×10^6	3×10^{16}	1.96×10^{-10}	2.84×10^6	123
ultraviolet	500	200,000	6×10^{15}	3.93×10^{-11}	570,000	25
	1,000	100,000	3×10^{15}	1.96×10^{-11}	284,500	12.3
	1,234	81,000	2.7×10^{15}	1.59×10^{-11}	250,000	10
	2,000	50,000	1.5×10^{15}	9.82×10^{-12}	142,300	6.17
	3,000	33,333	1×10^{15}	6.55×10^{-12}	94,840	4.11
violet	4,000	25,000	7.5×10^{14}	4.12×10^{-12}	71,120	3.09
blue-green	5,000	20,000	6×10^{14}	3.93×10^{-12}	57,000	2.47
orange	6,000	16,666	5×10^{14}	3.27×10^{-12}	47,400	2.06
red	7,000	14,286	4.3×10^{14}	2.81×10^{-12}	40,600	1.76
	8,000	12,500	3.7×10^{14}	2.42×10^{-12}	35,500	1.54
near infrared	10,000	10,000	3×10^{14}	1.96×10^{-12}	28,450	1.23
	12,337	8,100	2.7×10^{14}	1.59×10^{-12}	25,000	1.000
infrared	100,000	1,000	3×10^{13}	1.96×10^{-13}	2,845	0.12
	1,000,000	100	3×10^{12}	1.96×10^{-14}	284	0.01

The relationship between various types of radiation and energy is illustrated by an example: *e.g.*, bluegreen light: (1) Its wave length, λ, is 5000 Å.U.; (2) The wave number is 20,000 waves per centimeter; (3) The frequency, ν, is 6×10^{14} waves per second; (4) Its energy per photon, or $h\nu$, is $(6.55 \times 10^{-27}) \times (6 \times 10^{14}) = 3.93 \times 10^{-12}$ erg. (5) The heat energy per mole of activated molecules, $Nh\nu$, is obtained by multiplying the energy of one photon (4) by the number of photons to activate one mole (N, Avogadro's number $= 6.06 \times 10^{23}$) and dividing by the number of ergs per gm. cal. (4.185×10^7). (6) The energy of the photon, in electron volts, is 2.47.

silica. The colored varieties are used as semi-precious stones. The native varieties are:

rock crystal.....colorless, well-formed, hexagonal crystals.
amethyst.....a red-violet, * transparent variety.
catalinite.....a green, red, and brown mottled variety.
cats eye.....a green and brown variety.
citrine.....a yellow variety.
rose quartz.....a pale rose variety.
milky quartz....an opalescent variety.
smoky quartz...a gray variety.

It is very resistant to acids, m.1750, and is used for chemical apparatus. The transparent varieties (rock crystals) are used for piezoelectric plates, oscillators, lenses and other optical apparatus, as they are transparent to ultraviolet rays. Fused quartz of great transparency is used for many optical and electrical instruments, and quartz threads are used for delicate suspensions because of their great elasticity.

q. apparatus. Chemical utensils made from fused rock crystal that are highly resistant to sudden temperature changes and will not crack; as, beakers, crucibles, dishes, flasks, retorts, test tubes, and tubings. They differ from the domestic fused silica ware, in that they are transparent. **q. lamp.** Mercury vapor lamp. **q. lens.** (1) A concave or convex lens cut from rock crystal, which is transparent to ultra-violet rays. (2) A lens made from fused quartz. **q. oscillator.** A section cut from a q. crystal; used to tune radio circuits, as it shows sharply-tuned resonance. **q. resonator.** Q. oscillator. **q. rock.** Quartzite.

quartzite. A white or yellow impure quartz.

quassia. Bitter wood, bitter ash. The dried wood of *Picrasma excelsa* (Jamaica q.) or *quassia amara* (Surinam q.), a South American Simarubaceae. It contains 0.03 % of quassin, and is used as a bitter tonic, hop substitute and vermicide. **q. wood.** Quassia.

quassic acid. $C_{36}H_{38}O_{10} = 558.30$. A glucoside from quassia.

quassin. $C_{10}H_{12}O_3 = 180.1$. A bitter principle from Jamaica or Surinam quassia. Colorless crystals, m.210, slightly soluble in water, soluble in alcohol; used as a tonic.

quassoid. The total bitter principles of quassia; used medicinally as a febrifuge and bitter tonic.

quaternary. (1) The last and most recent geologic epoch q.v. (2) A compound containing four

different elements or four types of atoms; as $NaHSO_4$. **q. amines.** Organic derivatives of NH_4OH in which the hydroxyl group and the four hydrogen atoms are replaced by radicals, as NMe_4I. **q. carbon atom.** A carbon atom that is linked to four other carbon atoms.

quebrachamine. An alkaloid from quebracho. Colorless crystals, m.142; insoluble in water, soluble in alcohol or ether.

quebrachine. $C_{21}H_{26}N_2O_3$ = 354.3. An alkaloid from quebracho bark. Colorless or slightly yellow crystals, m.214, insoluble in water, soluble in hot alcohol or hot ether; used as an antiperiodic and tonic. **hypo-** $C_{21}H_{26}O_2N_2$ = 338.26. A yellow or brown amorphous powder from quebracho bark, insoluble in water, soluble in alcohol or ether. **q. hydrochloride.** $C_{21}H_{26}O_3N_2.HCl$ = 390.7. A colorless crystalline powder, slightly soluble in water or alcohol; used medicinally for asthma.

quebrachite. Quebrachitol.

quebrachitol. $C_7H_{14}O_6$ = 194.11. Methoxypinite, *l*-inosite methyl ether, quebrachite, bornesitol. Colorless crystals, d.1.54, m.191, $b._{6mm}210$. Cf. *pinite.*

quebracho. Aspidosperma. The dried bark of *Aspidosperma quebracho blanco*, a South American tree; used medicinally as a tonic and antiasthmatic. **q. blanco.** The dried and powderized bark of *Aspidosperma quebracho-blanco.* It contains tannins and a number of alkaloids: aspidospermine, hypoquebrachine, quebrachamine, quebrachine. **q. colorado.** The dried wood of *Schinopsis* species, which contains fisetin. **q. extract.** A liquid or solid extract from the heart-wood of quebracho, containing 35 % to 65 % tannin; used in the tanning industry. **q. gum.** The dried juice of *Schinopsis lorentzii*, an Anacardiaceae of Argentine, used for tanning.

quebrachomine. An alkaloid from quebracho.

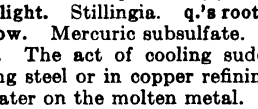
queen-of-the-meadow. (1) The dried root of *Eupatorium purpureum*, a Compositae; used medicinally as the fluid extract, as an astringent and diuretic. Cf. *euparin.* (2) Meadow sweet.

queen's delight. Stillingia. **q.'s root.** Stillingia. **q.'s yellow.** Mercuric subsulfate.

quenching. The act of cooling suddenly; as in tempering steel or in copper refining, the pouring of water on the molten metal.

quercetagetin. $C_{15}H_{10}O_8$ = 318.08. A yellow crystalline principle, m.318, derived from African marigold. See *flavone.*

quercetin. $C_{15}H_{10}O_7$ = 302.16. Meletin, sophoretin, quercetinic acid, flavin,



tetrahydroxyflavanol. A yellow dye obtained by decomposition of quercitrin, a rhamnoside from oak bark. A brown powder, d.1.58, m.312; slightly soluble in water, soluble in alkalis. **hydroxy-** Myricetin. Cf. *rhamnetin.*

quercetinic acid. Quercetin.

quercic, quercinic acid. Quercin (2).

quercimetin. Quercitrin.

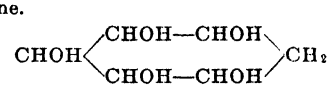
quercin. (1) $C_6H_{12}O_6$ = 180.1. A bitter crystalline carbohydrate, from oak bark and acorns. (2) $C_{15}H_{12}O_8.2H_2O$ = 308.1. Quercic acid, quercinic acid, oaktannin. A light brown or yellow powder from the wood of *Quercus* species. Cf. *quercitannic acid.*

quercitannic acid. $C_{28}H_{28}O_{14}$ = 588.22. A tannin from oak bark; it is hydrolysed to oak-red.

quercite. Quercitol.

quercitin. (1) A glucoside in ragweed pollen. (2) Quercetin.

quercitol. $C_6H_{12}O_5$ = 164.1. Cyclohexanpentol*, quercite, acorn sugar, pentahydroxycyclohexane.



A colorless, crystalline substance of sweet taste found in oak bark, d.1.585, m.224 (decomp.), soluble in water, slightly soluble in alcohol, insoluble in ether; an isomer of pinitol.

quercitrin. $C_{21}H_{22}O_{12}.2H_2O$ = 502.3. Quercimetin, quercitrinic acid. A rhamnoside of quercitron bark, oak bark, tea leaves, hops, horsechestnut and other plants. Yellow crystals, m.160–200, insoluble in water, slightly soluble in alcohol and alkalis. It is hydrolysed by acids to isodulcitol and quercetin, and is used in their manufacture.

quercitrinic acid. Quercitrin.

quercitron. The coarse, powdered bark (25 % tannin) of *Quercus tinctoria*, a Cupuliferae of North America; used in tanning leather and in dyeing wool and silk.

quercus. The dried bark of *Quercus alba* (white oak), a Cupuliferae. Used medicinally as the fluid extract, as an astringent; technically, in the tanning industry.

Quevenne's iron. Reduced iron.

quickening liquid. A solution of mercuric nitrate or cyanide, used in electroplating.

quicklime. A calcined material, the major part of which is calcium oxide or hydroxide in natural association with a lesser amount of magnesium oxide; capable of being slaked with water.

quicksilver. Mercury. **horn-** A native mercurous chloride.

quick-vinegar process. A method of manufacturing vinegar by passing weak alcohol slowly through vats filled with wood-shavings, which are covered with *Bacterium aceti.*

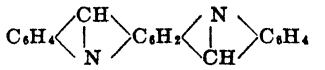
quillaia. Quillaya, quillaja, soap bark, Panama bark. The bark of *Quillaja saponaria*, a Rosaceae of South America, containing saponins. Used for washing, as a foam producer in soft drinks, as an emulsifier, and in shampoos.

quillaic acid. $C_{19}H_{30}O_{10}$ = 418.3. A saponin from the bark of *Quillaja saponaria.*

quina. Cinchona bark.

quinacetine. $C_{27}H_{31}N_3O_2$ = 429.4. An alkaloid from cinchona bark. **q. sulfate.** $(C_{27}H_{31}N_3O_2)_2H_2SO_4.H_2O$ = 974.8. An odorless, colorless powder, soluble in water. Used medicinally as an antipyretic and anodyne.

quinacridine. $C_{20}H_{12}N_2$ = 280.2. A series of pentacyclic compounds which consist of three benzene rings and two pyridine rings fused together; as,



quinacrine. $C_{23}H_{30}ClN_3O$ = 401.98. Mepacrine; the 2-chloro-5-[ω-diethylamino-α-methylbutylamino] -7-methoxyacridine. **q. hydrochloride.** $C_{23}H_{30}ClN_3O.2HCl.2H_2O$ = 508.91. Yellow powder; used as an antimalarial.

quinaldic acid. 2-Quinoline carboxylic acid. **hydroxy-** Kynurenic acid.

quinaldine. $C_{10}H_9N$ = 143.13. α-Methylquinoline,  . A colorless liquid, d.1.186, m. −8, b.244, slightly soluble in water, soluble in alcohol or ether; used medicinally. **naphtho-** See *naphthoquinaldine.* **oxy-** See *oxyquinaldine.* **phenyl-** See *phenylquinaldine.*

quinaldinium compounds. Derivatives of quinaldine in which the nitrogen atom is pentavalent; as, quinaldinium methyl iodide, $C_{10}H_9N(CH)_3I$.

quinalizarin. $C_{14}H_{12}O_2$ = 212.1. *1.2.5.8*-Tetrahydroanthraquinone. A spot test reagent for beryllium; the violet color of an alkaline solution changes to deep blue.

quinamicine. $C_{19}H_{24}N_2O_2$ = 312.3. An alkaloid from cinchona bark.

quinamidine. $C_{19}H_{24}N_2O_2$ = 312.3. An isomer of quinamicine.

quinamine. $C_{19}H_{24}N_2O_2$ = 312.3. A crystalline alkaloid from cinchona bark. Cf. *apoquinamine.*

quinanaphthol. $C_{20}H_{24}N_2O_2(OHC_{10}H_6SO_3H)_2$ = 786.49. Quinaphthol, chinaphthol, quin ne-beta-naphtholmonosulfate. A yellow crystalline powder, m.185, soluble in water or alcohol; used medicinally.

quinane. $C_{20}H_{24}N_2$ = 292.21. Desoxyquinine. The heterocyclic hydrocarbon obtained by reduction of quinine.

quinaphthol. Quinanaphthol.

quinaseptol. Diaphthol. **q. silver.** Argentol.

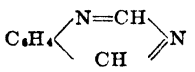
quinasitinic acid. $C_9H_7NO_4$ = 193.1. Amidobenzoylglyoxalic acid. $C_6H_4(NH_2).CO.CO.COOH$.

quinate. A salt of quinic acid, as urea quinate. **q. of urotropine.** Quinotropine.

quinazerin. Quinizarin.

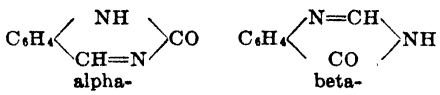
quinazine. Quinoxaline.

quinazoline. $C_8H_6N_2$ = 130.06. Phenmiazine, benzopyrimidine 1.3-benzodiazine, q.v. The heterocyclic compound



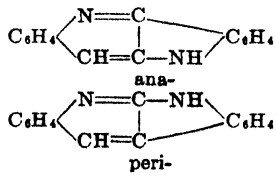
Colorless crystals, m.48, b.243. **dihydroketo-** Quinazolone. **diketotetrahydro-** Benzoyleneurea. **ketodihydro-** Quinazolone. **methyl-** $C_9H_8N_2$ = 144.1. 2-Methylquinazoline. A colorless crystalline powder, m.35, b.238; soluble in alcohol. **oxy-** Quinazolone.

quinazolone. $C_8H_6N_2O$ = 146.1. Oxyquinazoline, ketodihydroquinazoline. Cf. *quinoxalone.* The heterocyclic compounds:

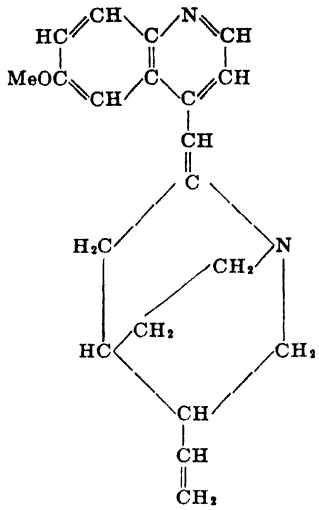


quince seeds. The dried seeds of *Pyrus cydonia,* a rosaceous tree. Used medicinally as the mucilage, as a demulcent.

quindoline. $C_{15}H_{10}N$ = 204.1. The heterocyclic compounds:



quinene. $C_{20}H_{22}N_2O$. Koenig's term for the heterocyclic parent compound of the quinine alkaloids:



quinetum. A mixture of the alkaloids of the cinchona bark in the same proportions as they occur in nature. Cf. *quinium, quinoidine.*

quinhydrone. $C_{12}H_{10}O_4$ = 218.14. A compound of quinone and hydroquinone. $C_6H_4O_2.C_6H_4(OH)_2$. A dark green powder; soluble in hot water, alcohol or ether, m.171, subliming. **q. electrode.** A reversible electrode consisting of a platinum wire in a saturated solution of quinhydrone, which gives a well-defined potential in acid and neutral solutions, and is used as a standard in pH determinations. Quinhydrone dissociates in solution to quinone and hydroquinone; hence it establishes the equilibrium: $C_6H_4O_2 + 2H^+ + 2e \rightleftharpoons C_6H_4(OH)_2$. If E is the E.M.F., read against a saturated calomel electrode at 18°C. the pH value is given by $2.03 + E/0.0577$.

quinhydrones. A series of compounds or mixtures of quinones and hydroquinones, which are formed as intermediate products in the reduction of quinones.

quinia. Quinine.

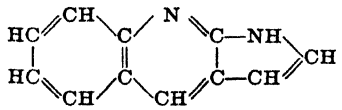
quinic acid. $C_7H_{12}O_6$ = 192.1. Kinic acid, hexahydrotetrahydroxybenzoic acid. The monobasic acid, $C_6H_7(OH)_4.COOH$, in cinchona bark. Colorless monoclinic crystals, d.1.637, m.162 (decomp.), soluble in water, alcohol or ether; used medicinally for gout.

quinicine. $C_{20}H_{24}N_2O_2$ = 324.20. An amorphous alkaloid, m.60, isomeric with quinine and quinidine, obtained from cinchona bark.

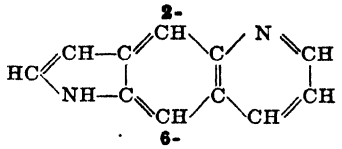
quinidamine. $C_{19}H_{24}N_2O_2$ = 312.3. An alkaloid from cinchona bark.

quinidine. $C_{20}H_{24}N_2O_2$ = 324.2. An alkaloid from the bark of cinchona species: the dextro isomer of quinine. Colorless monoclinic prisms, m.168, insoluble in water, soluble in alcohol, ether or chloroform. Used medicinally as a cardiac rhythm regulator and similarly to quinine. **q. hydrochloride.** $C_{20}H_{24}N_2O_2.HCl$ = 360.8. White prisms, soluble in water, alcohol or ether. **q. sulfate.** $(C_{20}H_{24}O_2N_2)_2.H_2SO_4$ = 746.4. A colorless crystalline powder, soluble in water; used as a quinine substitute.

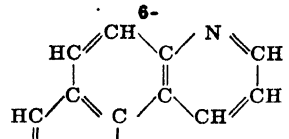
quinindole. $C_{11}H_8N_2$ = 168.02. A series of heterocyclic compounds:



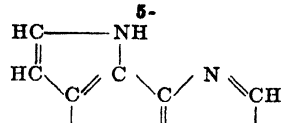
2-



6-



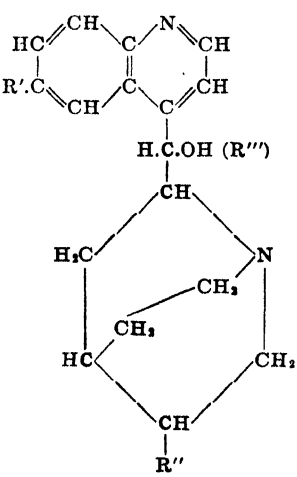
5-



8-

quinine. $C_{20}H_{24}O_2N_2$ = 324.3. Quinina, quinia, chinine, *Qu*. A levorotatory alkaloid from the bark of *Cinchona* species. Colorless, long silky needles, m.175, slightly soluble in water and soluble in alcohol or ether. Used medicinally as a stimulant, and in malarial fever. Its dextrorotatory isomer is quinidine. **beta-** Quinidine. **desoxy-** Quininone. **eu-** Quinine ethylcarbonate. **salicyl-** Saloquinine.

q. alkaloids. A group of alkaloids from cinchona bark, related to quinine. The structure ascribed to quinine contains four asymmetric carbon atoms which are indicated by bold type, **C**.



The structure of the different alkaloids is indicated by substituting the following atoms or groups for the radicals:

R′ R″	*levo*-isomer	*dextro*-isomer
H (*1*)	cinchonine	cinchonidine
H (*2*)	hydrocinchonidine	hydrocinchonine
OH (*1*)	cupreine	cupreidine
OH (*2*)	hydrocupreine	hydrocupreidine
OCH_3 (*1*)	quinine	quinidine
OCH_3 (*2*)	hydroquinine	hydroquinidine
OCH_3 (*3*)	ethylquitenine	ethylquitenidine
OC_2H_5 (*2*)	optochine	optochinidine
OC_5H_{11} (*2*)	eucupine	(eucupidine)
OC_8H_{17} (*2*)	vuzine	(vuzidine)

(*1*) is —CH:CH_2; (*2*) is —CH_2.CH_3; (*3*) is —$COOC_2H_5$.

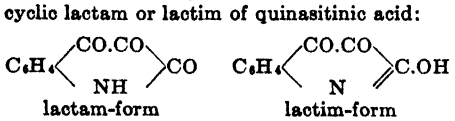
q. acetate. $QuC_2H_4O_2$ = 384.3. A fine white crystalline powder, soluble in water or alcohol; used as a diuretic and in malaria. **q. acetylsalicylate.** *Qu*.$CH_3COO.C_6H_4.COOH$. Quinine aspirin, xaxaquin. A white crystalline powder, used medicinally. **q. aesculinate.** Escoquinine. A yellow amorphous powder, insoluble in water; used medicinally. **q. albuminate.** Yellow scales, soluble in acids; used as a tonic. **q. anisate.** $Qu_2C_{10}H_{12}O.2H_2O$ = 832.7. Anetholquinine. Colorless crystals; soluble in alcohol or ether. **q. antimonate.** QuH_3SbO_4 = 513.2. Q. stibnate. A white powder, insoluble in water; used medicinally as an antirheumatic. **q. arrhenate.** $Qu_2AsO(OH)_2CH_3$ = 788.7. Q. methylarsenate. A colorless crystalline powder, m.140; insoluble in cold, slightly soluble in hot water. **q. arsenate.** $Qu_2H_3AsO_4.8H_2O$ = 934.8. Colorless crystals, soluble in hot water; used medicinally as a tonic. **q. arsenite.** $Qu_2H_2AsO_3$ = 773.6. A white powder; slightly soluble in water, soluble in alcohol. **q. aspirin.** Q. acetyl salicylate. **q. benzoate.** $QuC_7H_6O_2$ = 446.3. Colorless crystals, slightly soluble in water, soluble in alcohol; used medicinally. **q. borate.** QuH_3BO_3 = 386.3. A white crystalline powder, soluble in water or alcohol. **q. bromate.** $QuHBrO_3$ = 453.3. Colorless crystals, soluble in water or alcohol. **q. camphorate.** $QuC_{10}H_{16}O_4$ = 556.4. A white powder; insoluble in water, soluble in alcohol or ether. **q. carbolate.** Phenolquinine. A white powder; slightly soluble in water, soluble in alcohol. **q. carbonate.** $QuH_2CO_3.H_2O$ = 404.4. Colorless needles; soluble in water or alcohol, insoluble in ether. **q. chlorate.** $QuHClO_3$ = 408.8. White crystals; soluble in water or alcohol. (Dangerous, as it explodes when heated.) **q. chromate.** $QuH_2CrO_4.2H_2O$ = 478.4. Yellow needles; insoluble in water. **q. cinnamylate.** $Qu.C_9H_8O_2$ = 472.3. White crystals; soluble in water. **q. citrate.** $Qu_2C_6H_8O_7.7H_2O$ = 966.7. Colorless crystals; soluble in hot water or alcohol. **q. eosolate.** $Qu_2C_9H_7O_{12}S_2$ = 1051.7. Q. trisulfoacetylcreosote. A quinine compound used in medicine. **q. ethylcarbonate.** $QuEt_2CO_3$ = 442.3. Euquinine. A light powder of very fine needle-shaped crystals, m.89, slightly soluble in water, soluble in alcohol, ether or chloroform. Used as a tasteless quinine substitute in medicine. **q. ferricyanide.** $QuH_3Fe(CN)_6$ = 539.6. Yellow crystals, slightly soluble in water. **q. ferrosulfate.** A brown powder, slightly soluble

in water; used medicinally as a tonic. **q. formate.** $Qu CH_2O_2$ = 370.3. White glassy needles, soluble in water or alcohol, insoluble in ether. **q. glycerophosphate.** $Qu_2H_2PO_4C_3H_7O_2.4H_2O$ = 892.6. Kineurine. A white powder, soluble in hot water or alcohol; used medicinally as a tonic. **q. hydrochloride.** $Qu HCl$ = 360.8. Colorless silky needles, m.156; soluble in water, alcohol, or ether. **q. hydroiodide.** $Qu HI$ = 452.2. A yellow powder; soluble in alcohol. **q. hypophosphite.** $Qu HPO_2.2H_2O$ = 424.3. Small white silky needles, decomp. when heated and form PH_3; soluble in water, alcohol, or chloroform. **q. iodate.** $Qu HIO_3$ = 500.2. Colorless needles; slightly soluble in water, soluble in alcohol. **q. ligosinate.** An orange-yellow powder; insoluble in water, soluble in alcohol. **q. nitrate.** $Qu HNO_3$ = 387.4. Colorless crystals; soluble in water or alcohol. **q. phenolsulfonate.** $Qu C_6H_4(OH)SO_3H$ = 498.4. Quinine sulfocarbolate. A yellow amorphous mass; slightly soluble in water, soluble in alcohol. **q. quinate.** $Qu C_7H_{12}O_6.2H_2O$ = 552.4. A white or yellowish crystalline powder; soluble in water or alcohol. **q. salicylate.** Saloquinine. **q. santonate.** $Qu C_{15}H_{20}O_4$ = 588.5. A yellow powder; soluble in alcohol. **q. stearate.** $Qu C_{18}H_{36}O_2$ = 608.6. Colorless crystals, soluble in alcohol; used for sunburns. **q. stibnate.** Q. antimoniate. **q. succinate.** $Qu_2C_4H_6O_4.8H_2O$ = 910.8. Colorless needles; slightly soluble in water, soluble in alcohol. **q. sulfate.** $Qu_2H_2SO_4.7H_2O$ = 872.8. The most frequently-used quinine salt. Colorless silky needles, m.205, slightly soluble in water, soluble in alcohol, ether, or very dilute acids. Used medicinally as an antipyretic, antiperiodic and antimalarial. ***iodo-.*** Herapathite. **q. s. periodide.** Herapathite. **q. sulfoguaiacolate.** Sulfoguaiacin. Yellow leaflets; soluble in water; used as an antiseptic. **q. sulfoiodoiodate.** $Qu_2(H_2SO_4)_2(HI)_2I_4.3H_2O$ = 1760.26. Dichromatic crystals which polarise light similarly to tourmaline. **q. synthesis.** Skraup's reaction. **q. tannate.** $Qu(C_{14}H_{10}O_9)_2.8H_2O$ = 1434.7. A yellowish-white powder; partly soluble in alcohol. **q. trisulfoacetylcreosote.** Q. eosolate. **q. urea hydrochloride.** Urea quinine. A mixture of urea and quinine hydrochloride; a white powder, soluble in ether. **q. valerate.** $Qu C_5H_{10}O_2.H_2O$ = 444.4. White lustrous crystals; slightly soluble in water, soluble in alcohol.

quininic acid. $C_{11}H_9NO_3$ = 203.14. The monobasic acid, MeO.C_9H_5N.COOH. Yellow prisms, m.280 (decomp.), slightly soluble in water or ether, soluble in alcohol; used in organic synthesis.

quininone. $C_{20}H_{22}N_2O_2$ = 322.3. Rabe's name for the ketone of quinine (q.v.) in which the connecting CHOH group, (R‴), is replaced by the CO radical, while R′ is OCH_3 and R″ is $CH{:}CH_2$.

quinisatin. $C_9H_5NO_3$ = 175.1. The heterocyclic lactam or lactim of quinasitinic acid:

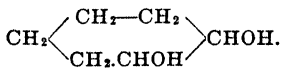


lactam-form lactim-form

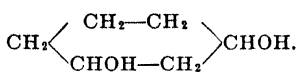
A colorless crystalline powder, m.257.

quinite. Quinitol.

quinitol. $C_6H_{12}O_2$ = 116.1. Quinite, *1,4*-cyclohexanol, cyclohexanediol. A group of diatomic alcohols occurring in several cis- and trans- forms, forming colorless crystals. **cis-1,2-**



m.75, b.225. **trans-1,2-** m.100, b.225. **cis-1,3-.** Resorcitol. m.65. **trans-1,3-** m.89.



cis-1,4-  m.102.

trans-1,4- m.140. **iso-1,4-** A colorless liquid, b.220.

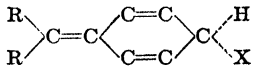
quinium. Crude quinine which contains the alkaloids of cinchona bark. An amorphous white mass, used in the manufacture of quinine and its salts. Cf. *quinetum, quinoidine.*

quinizarin. $C_{14}H_8O_4$ = 240.13. 1,4-Dihydroxyanthraquinone, quinazerin. A colorless solid, m.280; insoluble in water, soluble in alcohol or ether.

quinizine. Antipyrine.

quinoa. The dried seeds of *Chenopodium quinoa*, a Chenopodiaceae of Peru and Chile; used as a food and yields a starchy flour.

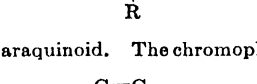
quinocarbonium. A salt of organic compounds of the quinone type:



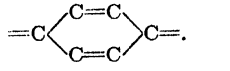
The dotted line indicates the carbonium valence.

quinochromes. Blue fluorescent products formed by the oxidation of vitamin B_1 with permanganate. Cf. *thiochrome.*

quinogens. An intermediate compound in the condensation of α-diketones to quinones, of the type:



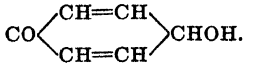
quinoid. Paraquinoid. The chromophoric group,



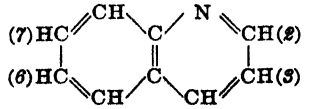
Cf. *hemiquinoid.*

quinoidine. A brown amorphous mass which consists of the non-crystallizable alkaloids of cinchona bark; used medicinally. Cf. *quinium.*

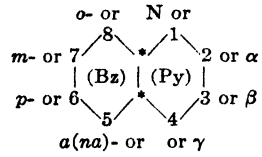
quinol. $C_6H_6O_2$ = 110.05. Hydroquinone, 4-hydroxy-p-benzenone. A tautomeric or keto-form of hydroquinol,



quinoline. C_9H_7N = 129.1. 1-Benzazine, chinoline. A decomposition-product of quinine, and a distillation product from bone oil and petroleum, which consists of the heterocyclic compound:



A colorless refractive oil, d.$_{20}$°1.0944, m. −20, b.238, aromatic odor; slightly soluble in cold water, soluble in hot water, alcohol, ether, benzene, or chloroform. Used as a solvent for resins, camphor, and terpenes, and medicinally, as an antiseptic. The derivatives are indicated by:



position:
1 or n- or Py-n-
2 or α or Py-1- or alpha
3 or β or Py-2- or beta
4 or γ or Py-3- or gamma
5 or a or Bz-4- or ana
6 or p or Bz-3- or para
7 or m or Bz-2- or meta
8 or o or Bz-1- or ortho

amino- Aminoquinoline. **aminophenylmethyl-** Flavaniline. **benzo-** Benzoquinoline. **chloro-** Chloroquinoline. **dibenzo-** Phenanthroquinoline. **dimethyl-** Kryptidine. **hydroxy-** Quinolinol. **iso-** 2-Benzazine, leucoline. A heterocyclic compound in which the nitrogen atom is in the 2-position. A colorless crystalline mass, m.23, b.240; slightly soluble in water. **methoxy-** Plasmoquin. **methoxytetrahydro-** Kairine. **α-methyl-** Quinaldine. **γ-methyl-** Lepidine. **α-oxy-** Carbostyril. **tetrahydro-** $C_9H_{11}N$ = 133.1. 1.2.3.4-tetrahydroquinoline. A colorless liquid, b.244.

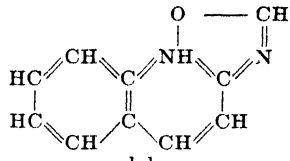
q. acids. $C_9H_6N.COOH$ = 173.1. There are seven mono-carboxylic acids of quinoline which are named according to the position of the carboxyl radical:
ortho- or 8-quinoline carboxylic acid, m.187.
meta- or 7-quinoline carboxylic acid, m.249.
para- or 6-quinoline carboxylic acid, m.291.
ana- or 5-quinoline carboxylic acid, m.369.
alpha- or 2-quinoline (quinaldic acid), m.156.
beta- or 3-quinoline (quinaldic acid) m.171.
gamma- or 4-quinoline (cinchoninic acid) m.254.
q. aldehyde. $C_9H_6N.CHO$ = 157.12. alpha- or 2-. A colorless crystalline powder, m.71; soluble in water. **q. alkaloids.** See *alkaloids*. **q. blue.** Cyanine. **q. dyes.** A group of dyestuffs, photographic sensitizers and indicators which contain the quinoline ring. See *cyanine*. **q. hydrochloride.** $C_9H_7N.HCl$ = 165.6. A colorless crystalline powder, m.94; soluble in water, alcohol, or ether. **q. red.** $C_{25}H_{19}N_2Cl$. 1.1′-Benzilidene-2.2′-quinocyanine chloride. A quinoline dye. **q. rhodanate.** Q. thiocyanate. **q. salicylate.** $C_9H_7N.C_7H_6O_3$ = 267.2. White crystals, soluble in water, glycerin, alcohol or ether; used as an antiseptic. **q. tartrate-** $(C_9H_7N)_2(C_4H_6O_6)_4$ = 987.5. A white powder, m.125, soluble in water, alcohol, or ether; used as an antiseptic. **q. thiocyanate.** $C_9H_7N.HCNS$ = 188.2. Q. rhodanate. A yellowish crystalline mass, m.137, slightly soluble in water, soluble in alcohol; used as a bactericide.

quinolinic acid. $C_7H_5O_4N$ = 167.1. Pyridine. 2.3-dicarboxylic acid*, $C_5H_3N(COOH)_2$. Colorless monoclinic crystals, m.190 (decomp.); insoluble in water, slightly soluble in alcohol, soluble in ether.

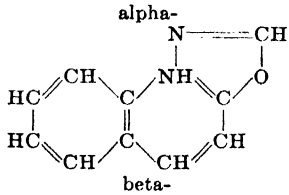
quinolinium compounds. Derivatives of quinoline in which the N-atom is pentavalent; they are analogous to pyridinium and quinaldinium compounds.

quinolinol. C_9H_7NO = 145.06. Hydroxyquinoline. **2-** Carbostyryl. **4-** Kynurine. **5-**m.224. **6-** m. 193, b.360. **7-** decomp. 238. **8-** Oxin. m.76, b.267; used as a precipitant for aluminum.

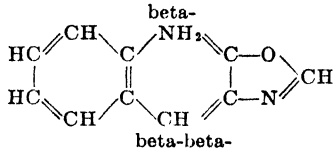
quinolinoxazole. $C_{10}H_6ON_2$ = 172.1. Chinolinoxazole. The heterocyclic compounds:



alpha-

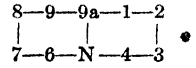


beta-



beta-beta-

quinolizine. C_9H_9N = 131.1. A group of heterocyclic compounds consisting of two pyridine rings, with a common N-atom.



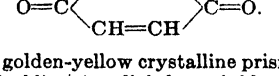
The single saturated C atom is marked 9a.

quinolone. Carbostyril.

quinolyl. Quinoyl. The monovalent radical, C_9H_6N—, derived from quinoline. There are seven possibilities of substitution (see *quinoline*).

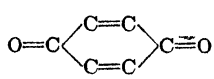
quinondiimine. Quinone diimine. See *quinone*.

quinone*. $C_6H_4O_2$ = 108.1. Benzoquinone, paradioxybenzene, benzenone, dihydrodiketo benzene.



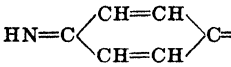
It forms golden-yellow crystalline prisms, d.1.31, m.116 (sublimes), slightly soluble in water, soluble in alcohol or ether; used as a reagent, **anthra-** See *anthraquinone*. **benzo-** Quinone. **dimethyl-** Xyloquinone. **dinitrohydroxy-** Nitranilic acid. **hydro-** Quinol. **meri-** Meriquinone. **methyl-** Toluquinol. **naphtho-** Naphthoquinone. **tetrachloro-** Chloranil.

q. chlorimide. C_6H_4ONCl = 141.53. A solid, m.116 (subliming), soluble in ether or alcohol, slightly in water. **q. compounds.** A series of organic dioxy-derivatives of ring-compounds that are characterized by the grouping,

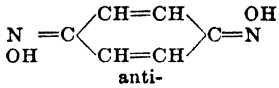


They are usually yellow in color, and are used as dyestuffs. **q. dichlorimide.** $C_6H_4N_2Cl_2$ =

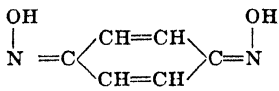
175.0. A solid m.164 (decomp.) soluble in ether. **q. diimine.** $C_6H_6N_2$ = 106.2.



m.124 (decomp.). **q. dioximes.** $C_6H_6N_2O_2$ = 138.10.

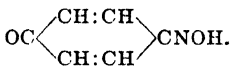


anti-



syn-

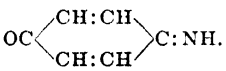
Decomp. 240. **q. diphenylmethane.** Fuchsone. **q. imine.** Quinonimine. **q. monoxime.** $C_6H_5NO_2$ = 123.1. Quinoxime.



Cf. *nitrosophenol*, of which it is the stabler tautomeric form. **q. pigments.** See *quinones*.

quinones. A group of yellow organic compounds characterized by the quinone grouping; as, brasilin, atrometin.

quinonimine. C_6H_5NO = 107.1.



quinonoid. The quinone structure. Cf. *quinone compounds, quinoid.*

quinonyl. The monovalent radical, $C_6H_3O_2$—, derived from quinone.

quinopyrine. Chinopyrine. A combination of antipyrine and quinine hydrochloride; very soluble in water. Used to treat malaria by sub-cutaneous injection.

quinoquinoline. 1.10-Naphthodiazine.

quinoral. Chinoral.

quinosol. Chinosol, potassium oxyquinoline sulfate. A yellow powder; soluble in water. Used as a preservative of anatomical specimens. Cf. *superol.*

quinotannic acid. $C_{14}H_{16}O_9$ = 328.12. Cinchonatannin. A tannin from cinchona bark; a light yellow powder, soluble in water.

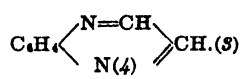
quinotropine. Urotropine quinate, chinotropine, hexamethylene amine quinate. A compound of urotropine and quinic acid, used medicinally.

quinovic acid. $C_{32}H_{48}O_6$ = 528.37. A white crystalline powder, soluble in chloroform or ammonium hydroxide.

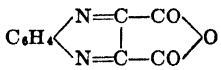
quinovin. $C_{30}H_{48}O_8$ = 536.37. Kinocin, chinovin. A glucoside from cinchona bark, m.235.

quinovose. A stereoisomer of rhamnose; a glucoside in cinchona bark.

quinoxaline. $C_8H_6N_2$ = 130.06. Benzo-p-diazine, quinazine, phenpiazine, 1.4-benzodiazine, q.v.

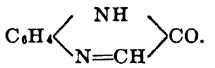


A colorless crystalline powder, m.30.5, b.226, slightly soluble in water, soluble in alcohol; used in organic synthesis. **benzo-** See *benzoquinoxaline.* **naphtho-** Naphthisodiazine. **oxychlorodiphenyl-** Luteol. **tetrahydro-** $C_8H_{10}N_2$ = 134.2. 1.2.3.4-Tetrahydro-quinoxaline. Colorless crystals, m.97, b.289; soluble in alcohol. **q. dicarboxylic acid.** $C_8H_4N_2(COOH)_2$ = 218.2. 2.3- or ab-. Colorless crystals, m.190; soluble in water or alcohol. **q. dicarboxylic anhydride.** $C_{10}H_4O_3N_2$ = 200.1. The heterocyclic compound,

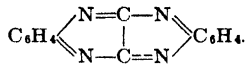


Colorless crystals, m.251.

quinoxalone. $C_8H_6ON_2$ = 146.1. The heterocyclic compound, (Cf. *quinazolone*)



quinoxalophenazine. $C_{14}H_8N_4$ = 232.2. The heterocyclic compound,



quinoxalyl. The monovalent radical, $C_8H_5N_2$—, derived from quinoxaline.

quinoxime. Quinone monoxime.

quinoyl. Quinone group.

quinque- Quinqui-. Pertaining to five.

quinquemolecular. Pertaining to five molecules. **q. reaction.** A reaction in which five similar molecules react with one another.

quinquevalent. (1) Having five different valencies. (2) Pentavalent. **q. nitrogen.** See *-onium.*

quinqui-. Quinque-.

quintal. (1) A unit of weight in the English system, equal to 100 pounds (av.). (2) A unit of weight in the metric system equal to 100 kilograms or 220.49 pounds, (av.).

quintavalent. Quinquevalent.

quintenyl. Amyl.

quintessence. A concentrated extract of any substance; as, an essential oil.

quintuple point. The temperature of a system at which five phases exist in equilibrium; as, salt a, salt b, double salt, solution and vapor. Cf. *triple-, quadruple point.*

quitenidine. $C_{19}H_{22}O_4N_2$ = 342.19. An oxidation product of quinidine. Cf. *chitenine.*

quotient. A number obtained as a result of a division. **albumen-** The number obtained by dividing the percentage of blood albumen by the percentage of total albumen. **D-** The ratio of glucose to nitrogen in urine.

q.v. An abbreviation for: (1) quantum vis—as much as you wish; and (2) quod vide—which see.

R

R. An abbreviation for: (1) organic radical, as R′ monovalent; R″ divalent; R′ ″ trivalent, etc. (2) The **gas** constant, R = 82.07 cc. atm. per degree = 1.9885 cal. per degree = 8.316 joules per degree. (3) Reaumur degree, °R. (4) Rankine degree, °R. **R acid.** 2-Naphthol-3.6-disulfonic acid. **2R acid.** 2-Amino-8-naphthol-3.6-disulfonic acid. **R salt.** Sodium salt of R acid.

r. Abbreviation for: (1) racemic, (2) radius. The symbol for the *röntgen* or **x**-ray intensity unit.

r_H. Reduction intensity, oxido-reduction potential, q.v.

ρ. The Greek letter rho. (1) The symbol for the mathematical constant 0.47693 62762. (2) The *pros-* or **2.3**-position of naphthalene. (3) the symbol for *rhe*, the absolute unit of viscosity.

Ra. The symbol for radium.

ra. Abbreviation for radioactive; as *ra*Cl = radiochlorine, *ra*Na = radiosodium.

rabble. An iron bar resembling a hoe, for stirring a molten metallic bath.

rabbling. The stirring or scraping of a charge of ore in a reverbatory furnace with an iron scraper.

rabelaisin. A poisonous glucoside from *Rabelaisia philippinensis*, a plant of the Philippines; used by the natives as an arrow poison.

*ra*C. Radiocarbon.

RaC′. Radium C′.

racahout. Starch or meal prepared from the edible acorn and used, mixed with sugar and flavoring, as an invalid food.

racemate. A salt of a racemic acid; generally of r-tartaric acid.

racemation. Racemization.

raceme. An optically-inactive compound that consists of equal quantities of dextro- and levo-compounds.

racemic. r- or *dl*-. Inactive, but separable into dextro- and levorotatory compounds. **r. acid.** (1) $C_4H_6O_6$ = 150.05. Paratartaric acid. The dibasic acid HOOC.CHOH.CHOH.COOH, an optically-inactive isomer of tartaric acid. Colorless triclinic crystals, m.205, soluble in water, alcohol or ether. It occurs in nature with d-tartaric acid. Cf. meso-*tartaric acid.* (2) An equimolecular mixture of d- and l-acids; it is optically-inactive. **r. compound.** A crystal which consists of an equal number of optically-active d- and l-molecules, but can be separated into its active constituents. Cf. *meso-compound.* **r. mixture.** An optically-inactive mixture of equal quantities of a dextro- and levo-compound.

racemism. The union of dextro- and levo-rotatory molecules to produce an inactive substance.

racemization. Racemation, racemisation. The transformation of optically-active substances into optically-inactive substances or mixtures. **auto-** The spontaneous transformation of an optically-active molecule into an optically-inactive molecule. **partial-** An incomplete racemic transformation, which affects only one or a few asymmetric groups in a molecule.

racemize. To convert an optically-active substance into an optically-inactive substance.

racemized. Describing a substance or mixture that has been separated into its optically-active constituents.

racephedrine. Racemic ephedrine. **r. hydrochloride.** Ephetonin. The hydrochloride of racemic ephedrine.

*ra*Cl. Radiochlorine.

rackarock. An explosive which is made on the spot as required; a mixture of $KClO_3$ and nitrobenzene, sometimes with picric acid.

racking. (1) The separation of ores by washing on an inclined plane (rack). (2) The final stage in brewing, when the liquor is clarified and run off ready for delivery. (3) The almost complete separation of solid glycerides from cod-liver oil by cooling.

raddle. Hematite.

radian. (1) An arc of a circle that is as long as the radius of the circle. (2) The angle subtended at the centre by the arc of a circle equal to the radius of the circle: $180°/\pi = 57.29578° = 57°17'45'' = 206265'' = 1$ radian, and $1° = 0.017453$ radians.

radiant. Diverging from a common center in all directions. **r. energy.** A dynamic disturbance of the ether that diverges from a common center and manifests itself as heat, light, or electricity (see *spectrum*). **r. flux.** See *flux*. **r. heat** Heat waves. **r. matter.** (1) The residual gas in a vacuum tube which has become luminous by the passage of a current of electricity. (2) Radio-active matter. **r. state.** (1) The condition of emitting light; as, incandescence, luminescence, fluorescence. (2) Crooke's fourth state of matter.

radiate. To spread from a common center.

radiated. An arrangement of crystals in the shape of rosettes.

radiated pyrite. Marcasite.

radiation. (1) The transmission of energy through space, unassociated with the motion of material particles, and without loss or change, —*electromagnetic* **r.** or *wave theory;* it accounts for interference, diffraction, refraction and polarization. (2) The emission of material particles moving at high velocity, *corpuscular* **r.** or *corpuscle theory;* it accounts for the photoelectric and Compton effects, the sharp spectral lines and the shift of wave length of x-rays scattered by electrons. (3) Sometimes, the transfer or diffusion of energy through matter, as heat waves or sound waves. Cf. *ray, irradiation, absorption, light.* **corpuscular-** A stream of particles; as, α-rays or canal rays, which consist of positively-charged atomic nuclei; or β-rays or cathode rays which consist of negatively-charged particles or electrons moving with the velocity of light. **cosmic-** A penetrating r. of very short wave length which reaches the earth from all directions of space, day and night, with equal intensity. It is assumed that its origin is the interstellar or intergalactic space, and its cause the transformation of matter into energy; *e.g.*, the energy liberated when four hydrogen atoms form a helium nucleus. Cf. *packing effect, mass-energy cycle.* **electromagnetic-** An electric field, E, oscillating at right angles to the direction of

propagation which is accompanied by a similar magnetic field, H, at right angles to the direction of both. The distance of points with a similar magnitude of E and H is the *wave length*, λ; the number of oscillations in unit time at a given point is the *frequency*, ν. The *velocity*, c, with which the waves travel through empty space is uniform for all radiations; hence $\nu = c/\lambda$. Cf. *light*. The *number of waves* per cm, is the wave-number, $n = 1/\lambda$, where λ is in cm.; or $n = 10^8/\lambda$, where λ is in A.U. See *Planck's constant*. The types of e.r. are shown in the diagram and table. It is assumed that all substances above the absolute zero of temperature send out e.r. at the cost of their own heat energy, the intensity of r. increasing with a rise in temperature and the radiations becoming shorter in wave length. Cf. *Rydberg formula, spectrum, Bohr atom.* **immaterial-** The vibratory disturbance of a medium; as, sound waves in air or electromagnetic waves in ether. **infraphotic-** See *electromagnetic-*. **K-, L, M . . .** See under *K, L, M*, etc. **material-** Corpuscular-. **mechanical-** Those material r. which cause a vibration or oscillation of molecules; as, infraphonic, sound, ultraphonic, and heat waves. **monochromatic-** A single colored r., which consists of waves of equal or approximately equal wave length. **photic-** See *electromagnetic-, light.* **polarized-** An electro-magnetic radiation in which the direction of the electromagnetic field of the waves is parallel; that is, the plane of the waves is parallel. In *plane* p. the plane remains constant; in *circular* p. the plane rotates, the vector describing a screw-like motion; in *elliptical* p. the plane rotates and also changes in quantity, the vector describing a helix wound around a rod of elliptical diameter. **solar-** (1) The r. of the sun which reaches the surface of the earth; its intensity is the "solar constant,"—the amount of energy per unit area and time: 1.938 cal. per min. per $cm.^2 = 1.35 \times 10^6$ erg per sec. per $cm.^2 = 1.81$ horse power per min. per $m.^2$ (2) The total radiation from the sun's surface, which is calculated to be 3.79×10^{33} ergs per sec. $= 5.43 \times 10^{27}$ cal. per min. or 5.08×10^{23} horsepower per minute. This quantity equals 89,500 cal. per min. per $cm.^2$; or 84,000 horse power per min. per $m.^2$ of the sun's surface. **ultraphotic-** See *electromagnetic-*.

r. constants. See *Planck's formula, Stefan-Boltzmann equation.* **r. effect.** The phenomena produced when r. falls on matter or is intercepted by a body. The effects of r. may be:

A. Physical,		*(Photophysical)*
1. mechanical		radiation pressure
2. thermal		pyroelectric thermionic thermallochromy
3. electrical		photoelectric
4. optical		luminescence fluorescence allochromy.
B. Chemical,		*(Photochemical)*
1. photographic	}	activation excitation ionization
2. phototechy		
3. photolysis		
4. oxidation and reduction		
5. synthesis, polymerization		
C. Biological		*(Photobiological)*
1. photosynthesis	}	irradiation
2. phototropy		
3. phototaxis		

r. hypothesis. See *r. theory* of chemical reaction. **r. pressure.** The force exerted by light on particles that it strikes; as, in the comet's tail, which is pushed away from the sun's direction. Cf. *radiometer*. On the earth surface r. pressure is exceedingly small; thus sunlight falling at right angles exerts a pressure of only 4.5×10^{-5} dynes (the weight of 1/28,000 cc. air). In the interior of a star it may assume enormous proportions; thus for the interior of the Sun, 8.5×10^{14} dynes per $cm.^2$ (a pressure of 83×10^7 atm.). **r. temperature.** See *radiator*. **r. theory of chemical reaction.** The application of the quantum theory to chemical reactions on the following assumptions: (a) Before a molecule can react, the electrons of its constituent atoms must become excited. (b) The energy, E, per gram molecule required to activate the molecule (the critical increment) may be calculated from the temperature coefficient of the reaction rate, K, by $\frac{d \log_2 K}{dT} = \frac{E}{RT^2}$. (c) Each molecule is activated by one quantum; hence, the total energy absorbed is, $E = Nh\nu$, where N is Avogadro's number or the number of molecules. Cf. *irradiation, radiometer*.

radiator. A body heated to incandescence, which emits an increasing amount of energy as the temperature is increased. **perfect-** Black body. A material absorbing all radiant energy (*i.e.*, reflecting no light) and transforming it into heat. Its emitting power is large and proportional to its temperature. The *total energy* of its radiation is proportional to the fourth power of its absolute temperature (Stefan's law). The *wave length* having maximum intensity is 0.289/T (Wien's law). The *intensity* of the radiations for any wave-length is found by Planck's equation.

radical. (1) A group of atoms that passes unchanged through a chemical reaction and behaves as a single atom; as, $(NH_4)^+$ or $(SO_4)^{=}$. The following symbols are used to indicate the more common radicals:

Ac	acetyl, CH_3CO— (also acetic or acyl)
Am	ammonium, NH_4— (or amyl)
Bu	butyl, C_4H_{10}—
Bz	benzoyl, C_6H_5CO—
Cy	cyan, CN—
Et	ethyl, C_2H_5—
Me	methyl, CH_3—
Ox	oxalic, $(COO)_2$=
Ph or φ, ϕ	phenyl, C_6H_5—
Pr	propyl, C_3H_7—

Compare also *Organic radicals*, q.v., and published by the chemical societies.
Other abbreviations frequently used are,

R	for radical
M	for any metal, usually monovalent
X	for any halogen or acid radical.

(2) A free radical, q.v. **acid-** An electronegative group of atoms that does not decompose in ordinary chemical reactions. See *acid radicals*. **acyl-** Ac. An acid organic radical of the general type R.CO—. **alkyl-** Al. An aliphatic organic radical; as, Me. or Et. **aryl-** Ar. Any aromatic organic radical; as, Ph. or Bz. **free-** In general, an unsaturated molecule, particularly a substance existing only in equilibrium with its

compounds; as, triphenyl methyl in equilibrium with its dimer hexaphenylethane, methyl in equilibrium with tetramethyl lead. **organic-** An unsaturated group of atoms which confers characteristic properties on a compound containing it, or which remains unchanged during a series of reactions; as —COOH carboxyl, or —CHO aldehyde radical. See *organic radicals, structure symbols.* **r. weight.** The sum of the atomic weights of the elements in the r.

radio- A prefix derived from the Latin which indicates a connection with rays or radiations. **r. chlorine.** *ra*Cl. See *chlorine.* **r. elements.** See *radioelements*, and table.

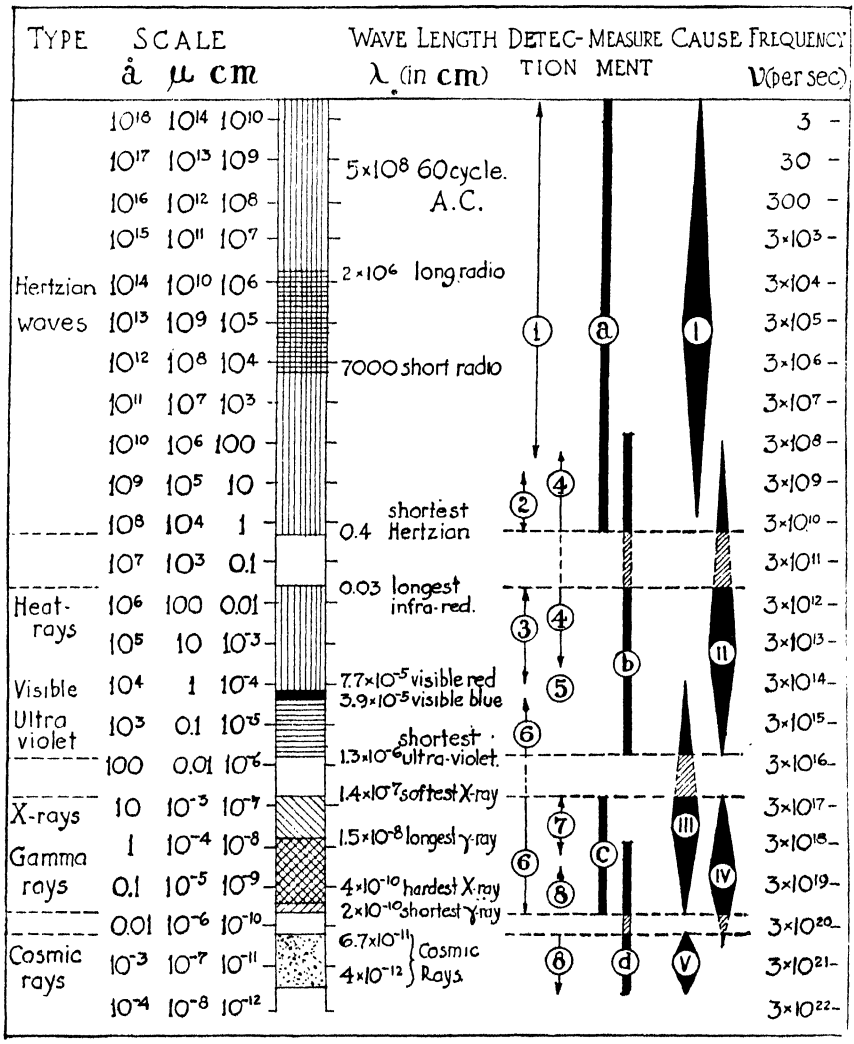
radioactinium. RaAc. A radioactive-disintegration product, atomic weight 226, atomic number 90, formed by the disintegration of actinium. It is an isotope of thorium and has a life period of 28.1 days and then disintegrates to actinium x.

radioactive. Having the property of giving off rays. **r. constant.** The factor, (λ), indicating the life period of a radioactive element in the equation, $\frac{dn}{dt} = \lambda n$, or $n = n_0 e^{-\lambda t}$; where n_0 is the number of atoms originally present, n, the number of atoms present after time t, and e the base of natural logarithms. **r. decay.** The speed of disintegration, given by:

$$N_1 = N_0 e^{-\lambda t} \quad \text{or} \quad N_1/N_0 = e^{-\lambda t}$$

where N_0 number of atoms originally present
N_1 number of atoms remaining after t time
λ radioactive transformation constant
e base of nat. log., 2.71828

r. disintegration. The breaking up of an atom of a radioactive element as indicated by the arrows in the figure. Thus a horizontal arrow indicates the loss of a helium nucleus (alpha-radiation); the element therefore becomes more electropositive and the atomic weight decreases by four. An inclined arrow indicates the loss of an electron (beta-radiation); the element therefore becomes more



Electromagnetic radiations

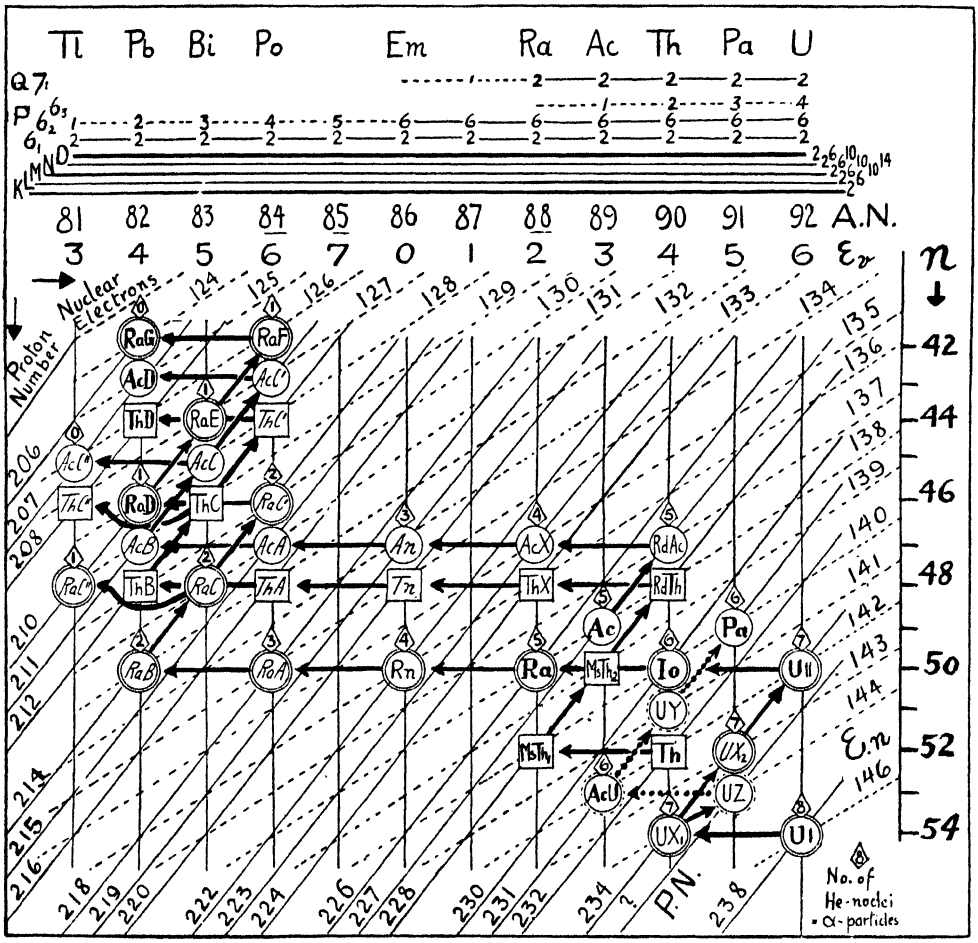
(1) *The wave lengths are given uniformly in centimeters.*
(2) Other units are: km. = kilometer, m. = meter, mm. = millimeter, Å = ångström units.
(4) *The generation or cause of these radiations is as follows:*
I—Coil rotating in magnetic field.
II—Oscillating triode valve, spark gap, etc.
III—Spark gap discharge.
IV—Heat radiations (chemical reactions).
V—Radiation from hot bodies and ionized gases.
VI—Radiations from very hot bodies and ionized gases.
VII—Emitted by sudden stoppage of fast-moving electrons.
VIII—Emitted when atomic nuclei disintegrate (radioactivity).
IX—Condensation of matter and transformation into energy.
(5) *The detection of the various radiations is shown by:*
1—Electric resonance in a receiving set (coherer, rectification and amplification).
2—Nichols' radiometer.
3—Bolometer.
4—Thermometer or thermocouples.
5—Selenium cell.
6—Photographic plate and phosphorescence.
7—Photoelectric effect.
8—Ionization of gas.
(6) *The measurement is accomplished by*
a—Quality of resonant electric circuit.
b—Interferometers or gratings.
c—Crystal diffraction.
d—Absorption coefficients.

electro-negative and the atomic weight remains the same. *artificial-* or *synthetic-* The breaking up of an element which has been exposed to bombardment with particles (protons, neutrons, deutons, etc). See *radioelements, nuclear reactions.* **r. earth.** Soil containing one microgram of radium per pound; used medicinally for external packs. **r. elements.** The elements of high atomic weight, which disintegrate spontaneously with the emission of various rays. There are three series beginning with uranium, actinium, and thorium (see table), and three types of radiation: (1) The emission of alpha-particles, or helium nuclei, lowers the atomic weight of the element by four and the atomic number by two. (2) Beta-particles, or negative electrons, increase the atomic number by one, as the element becomes more positive, but the atomic weight remains the same. (3) Gamma-rays, or x-rays, are a secondary phenomena caused by the beta-rays striking an obstacle. For synthetic or artificial r. elements, see *radio elements, nuclear reactions.* **r. equilibrium.** A state of balance in a mixture of radioactive elements consisting of products of such long life-periods that their radiations and compositions may be considered constant; or, the decay may be balanced by the formation of fresh products, as in the transformation of radon into helium. **r. indicator.** Radiothor. A r. substance, used to detect small quantities of its isotope in chemical analysis. It is mixed in minute amounts with the isotope, and the resulting mixture behaves as a single chemical substance, although the former



Radioactive disintegration

showing the uranium, actinium, and thorium series, and the relation existing between atomic weight, valency, rays and isotopes.

◎ = uranium-radium family; □ = thorium family; ○ = actinium family; ← α-rays, the atom loses one helium nucleus; ↗ β-rays, the atom loses one electron.

A, B..... Average life of isotope is over a year
A, B..... Average life of isotope is between one hour and a year
A, B..... Average life of isotope is less than one hour

The following relations exist: $A = e - n = (p - n)/2$, and $e = p - A = (n + A)$, where A is the *atomic number*, e the number of *nuclear electrons*, p the number of *protons* and n the number of *neutrons*.

* The names, symbols and constants are those preferred by the "International Radium-Standards Commission. *J. A. Chem. Soc.*, 1931, **53**, 2437.

(1), (2) Other synonyms are *Brevium*, Bv for UX_2; *emanation*, Em or *niton*, Nt, for the isotopes Rn, Ac, and Tn; *uranium-lead*, Pb^{206}, for RaG; *actinium-lead*, Pb^{207}, for AcD; *thorium lead*, Pb^{208}, for ThD; *polonium*, Po, for RaF; also the symbols *RaAc* for RdAc and *RaTh* for RdT.

(3) Proton number, or isotopic weight, is the number of hydrogen nuclei.

(4) Atomic number is the charge on the kernel, or the number of electrons.

(5) Half period, T, is the time in which the quantity of radioactive substance is reduced to one half. yr. = year d. = day, h. = hour, m. = minute, s. = second.

(6) Average life, τ, is the average life of radioactive atoms.

(7) Decay constant, λ, is given in seconds, $\tau = 1/\lambda$. 1 Year = 3.155693×10^7 seconds.

(8) Range in cm. of the radiations in air at 15°C., 760 mm.

(9) Absorption coefficient, μ, in aluminum, the thickness of which is measured in cm.

(10) Rays, or type of decay.

may always be detected by its radioactivity. **r. substance.** A substance that contains a radioactive element. **r. units.** See *radium units.*

radioactivity. The phenomenon of spontaneous disintegration of elements accompanied by the emission of rays. It is shown usually by elements of atomic weight higher than lead, and is not affected by chemical or physical influences. **artificial-** Induced r. **induced-** Artificial-, synthetic r. A temporary r. caused in an element of lower atomic number than lead by bombardment with particles. Cf. *radioelements, nuclear reactions, radiosodium.* **supra-** The type of r. characteristic of hypothetical elements with atomic numbers higher than 92. Cf. *transuranium, hypon.* **synthetic-** Induced.

radiobiology. A branch of science that studies the effects of radiations, especially of light, on living organisms.

radiochemistry. A branch of science dealing with radioactive elements and their reactions. Cf. *nuclear chemistry.*

radioelements. (1) The elements of atomic numbers, 82 to 92, lead to uranium. Other elements however, may be slightly radioactive (as potassium). (2) Synthetic or artificial r. An element of low atomic number which is made temporarily radioactive by exposure to high velocity protons, deuterons, neutrons or alpha-particles; as,

$$_5B^{10} + {}_2He^4 \rightarrow {}_0n' + {}_7N^{13} \text{ (radio nitrogen)}$$
$$_{12}Mg^{24} + {}_2He^4 \rightarrow {}_0n' + {}_{14}Si^{27} \text{ (radio silicon)}$$
$$_{13}Al^{27} + {}_2He^4 \rightarrow {}_0n' + {}_{15}P^{30} \text{ (radio phosphorus)}$$

In each case the r. formed is short-lived and breaks up:

$$ra\text{N or } {}_7N^{13} \rightarrow {}_6C^{13} + e^+$$
$$ra\text{Si or } {}_{14}Si^{27} \rightarrow {}_{13}Al^{27} + e^+$$
$$ra\text{P or } {}_{15}P^{30} \rightarrow {}_{14}Si^{30} + e^+.$$

Cf. *nuclear reaction, proton bombardment, radiosodium.*

(1) The general form of production is by bombardment with

p, protons: $_1H^1 + {}_aN^m = {}_{(a+1)}N^{(m+1)}$ (PE)

d, deuterons: $_1H^2 + {}_aN^m = {}_0n^1 + {}_{(a+1)}N^{(m+1)}$ (PE)
$_1H^2 + {}_aN^m = {}_1H^1 + {}_aN^{(m+1)}$ (EE)

n, neutrons: $_0n^1 + {}_aN^m = {}_1H^1 + {}_{(a-1)}N^m$ or
$_2He^4 + {}_{(a-2)}N^{(m-3)}$ (EE)

α, alpha-particles: $_2He^4 + {}_aN^m =$
$_0N^1 + {}_{(a+2)}N^{(m+3)}$ (PE)
$_2He^4 + {}_aN^m =$
$_1H^1 + {}_{(a+1)}N^{(m+3)}$ (EE)

(2) The radioelement of short life is either a (PE) = *positron emitter*, and changes to an element of next lower atomic number: $_aN^m \rightarrow {}_{(a-1)}N^m + e^+$; or an (EE) = *electron emitter*, and changes to an element of next higher atomic number:
$$_aN^m \rightarrow {}_{(a+1)}N^m + e^-$$

(3) Half-life, in s.-seconds, m.-minutes, hr.-hours, d.-days, yr.-years.

(4) Maximum energy, in MEV.

(5) The final and stable end-product.

radiogenic. Produced by radioactive action; as, uranium lead.

radiogram. (1) Röntgenogram. (2) Laue pattern. (3) Skiagraph.

radiograph. Röntgenogram. They have been divided into *exographs* (taken with x-rays), and *gammagraphs* (taken with γ-rays).

radiography. Skiagraphy. Photography with x-rays. **mass-** The routine X-ray examination of large numbers of persons by the reproduction of an x-ray image on a fluorescent screen, on a much-reduced scale, on a photographic film; used in tuberculosis studies.

radiolead. (1) The natural radioactive mixture of lead isotopes in minerals. (2) Radium G, PbRa, RaΩ or Pb^{206}. A radioactive disintegration-product of radium F and an isotope of lead.

radiolite. A variety of natrolite.

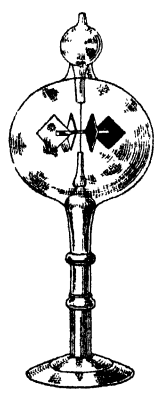
radiology. A branch of science that studies radioactivity and radioactive elements.

radiolucent. Offering some resistance to the passage of x-rays. Cf. *radiopaque, radioparent.*

radioluminescence. Fluorescence caused by radioactive rays striking an obstacle or screen treated with a suitable substance.

radiometallography. The examination of the structure of metals, especially steel, by photography with radioactive substances and fluorescent screens.

radiometer. (1) An instrument for measuring the penetrating power of radioactive rays. (2) An apparatus which measures the mechanical effect of light, q.v. (3) A bolometer. (4) A thermocouple. Cf. *radiator.*



Radiometer (2).

radiomicrometer. A delicate thermopile, used to detect small changes in the intensity of a radiation.

radion. An obsolete term for a particle thrown off by a radioactive element (see *alpha-particles, beta-particles*). Cf. *radon.*

radionitrogen. See *nitrogen.*

radiopaque. Impervious to the passage of x-rays. Cf. *opaque, radiolucent, radioparent.*

radioparent. Allowing the passage of x-rays freely. Cf. *transparent, radiopaque, radiolucent.*

radioscope. An electroscope used to detect radioactive substances.

radiosodium. See *sodium.*

radiostol. Viosterol.

radiotellurium. Polonium.

radiotherapy. Radium therapy.

radiothor. Radioactive indicator.

radiothorium. RaTh. A radioactive element, atomic number 90; disintegration-product of mesothorium-2. It is an isotope of thorium, and disintegrates to thorium-x.

radiovision. The transmission of pictures by wireless telegraphy. Cf. *television, teleopsis.*

radish. The root of *Raphanus sativus*, a Cruciferae, used as a vegetable. Its coloring matter is an indicator.

radium. Ra = 226.05. A radioactive element, atomic number 88; a disintegration-product of ionium. It is a homotope of barium, and isotope of thorium X, actinium X and mesothorium 1, which disintegrates to radon and helium, and was discovered in 1898 by Dr. and Madame Curie. It is a gray powder, m.700, decomp. by water, and forms a series of salts. It is extremely toxic, and deposits in the bones of organisms. **RaA, RaB, RaC,** etc. See *radioactive elements;* also table of radioactive elements and radium units. **r. bath water.** Water which contains 4 micrograms of radium per 200 cc. and is colored with fluorescein; used medicinally. **r. bromide.** $RaBr_2$ = 385.8. A colorless crystalline powder, soluble in water, alcohol or ether (sublimes, 900). Used medicinally, usually in admixture with $BaBr_2$. **r. carbonate.** $RaCO_3$ = 286.0. A white amorphous powder; insoluble in water, decomposed by acids. It is marketed as a mixture with $BaCO_3$. **r. chloride.** $RaCl_2$ = 296.5. A yellowish crystalline powder, m.1650; soluble in water. Used medicinally as a mixture with $BaCl_2$. **r. compress.** An oiled silk bag, which contains finely-ground radium ore and barium sulfate; used in the treatment of rheumatism and neuralgia. **r. drinking water.** A distilled water which contains 1 microgram radium in 30 cc; used medicinally. **r. emanation.** Radon. **r. F.** Polonium. **r. G.** Radio-lead. **r. sulfate.** $RaSO_4$ = 322.0. A white powder; insoluble in water or acids. It is marketed as a mixture with $BaSO_4$. **r. therapy.** Curie therapy. The use of radioactive substances in the treatment of disease. It is used either externally or internally. **r. units.** The amount of radium, or its activity, is usually expressed in: (1) Micrograms of radium (0.001 mg.). (2) Curies, (q.v.) millicuries, and microcuries; the emanation from 1 gram, 1 milligram, and 1 microgram of radium, respectively. (3) Mache units (q.v.), a concentration of radium emanation corresponding with $\frac{1}{2500}$ microcurie. Cf. *urane.*

radius. Any line from the center to the circumference of a circle:

$$\text{radius} = \tfrac{1}{2}\ \text{diameter} = \text{circumference}/\pi$$

radix. The Latin term for root. **r. sarsale.** Sarsaparilla.

radon. Rn = 222. Niton, radium emanation. The element of atomic number 86; the last member of the series of noble or inert gases. It occurs in radioactive minerals, and is produced as a result of radioactive disintegration. Discovered by Mme. Curie in 1898 (niton), and isolated by Dorn in 1901. It has a life of 5.5 days, and liquefies at −153°C to a colorless liquid, b. −65°C. The liquid solidifies at −71°C, d.9.97, and glows with a blue light which turns orange at lower temperatures.

***ra*F.** Radiofluorine.

RaF. Radium F.

raffia. Raphia.

raffinase. An enzyme that hydrolyzes raffinose, and appears to be identical with invertase. Cf. *melibiase.*

raffinate. A refined oil produced in the fractionation of crude lubricating oils.

raffinose. $C_{18}H_{32}O_{16}.5H_2O$ = 594.4. Melitriose, melitose. A carbohydrate derived from sugar beets, cottonseed, eucalyptus and other plants, which is hydrolysed to fructose, glucose and galactose. Colorless monoclinic needles, d.-1.465, m.119, soluble in water or alcohol.

RaG. Uranium-lead.

Ragsky test. The toxicological detection of chloroform by the reaction:

$$\underset{}{6CHCl_3} \rightarrow \underset{a}{C_6Cl_6} + \underset{b}{3Cl_2} + \underset{c}{6HCl};$$

a is deposited as white needles, *b* detected by iodide-starch paper and *c* absorbed by $AgNO_3$ solution.

ragweed. The dried leaves and flowers of *Ambrosia artemisiaefolia;* used as the fluid extract, as an astringent and styptic.

ragwort. Senecio.

raies ultimes. Ultimate lines. The strongest lines of a spectrum; those most easily and most persistently obtained from a given element, and used to identify it.

raised growth. A thick and heavy bacteria growth, with abrupt or terraced edges.

raisin. The dried ripe fruit of *Vitis vinifera* (grapes), a Vitaceae; used as food. **r. seed oil.** Grape seed oil. A yellow oil expressed from ground r. seeds, d.0.92-0.93. Used in foods, as a lubricant, and in soap making.

ralstonite. The mineral, $[3Al(OH,F)_3,(Na_2,Mg)F_2.2H_2O$.

Raman, Sir Chandrasekhara Venkata. 1888– . An Indian physicist and Nobel Prize winner. **R. effect.** The scattering of monochromatic light accompanied by a change in wavelength, due to the absorption of energy quanta by the scattering medium. Cf. *scattering, luminescence.* **R. lines.** The shift of wavelengths of spectrum lines of scattered light from a medium illuminated with monochromatic light. They indicate molecular structure and the type of atomic bonds. **R. spectrum.** The characteristic line patterns produced on a photograph taken at right angles through a substance illuminated with a quartz mercury lamp.

RAMAN LINES

Wavelength shift in cm.$^{-1}$	Bond	Type of compound
900	C—C	paraffins
1374	C=C	olefines
600, 1700	C=O	fatty acids
1050, 1250, 1360	C—O	primary alcohols
3400	O—H	water or methanol
3300	N—H	amines
1050	C—N	cyanides
739, 657	C=S	thioacids
2573	S—H	mercaptans

ramie. Rhea fiber. The bastfiber from *Boehmeria tenacissima*, a plant of the nettle family. It is used for weaving grass-cloth or Canton linen, and consists of almost pure cellulose. **false-** China grass from *B. nivea.*

ramigenic acid. $C_{16}H_{20}O_6$ = 308.2. An acid produced by the mould fungus, *Penicillium Charlesii.*

rammelsbergite. A native nickel arsenide, $NiAs_2$.

Ramsay, Sir William. 1852–1916. A British chemist who discovered the noble gases and

Sir William Ramsay.

some radioactive elements. **R.-Shields equation.** A relation which indicates the degree of association of molecules:

$$\gamma(MV)^{\frac{2}{3}} = K(t_c - t - 6)$$

where γ is the surface tension, MV the molecular volume, t_c the critical temperature, t the temperature of the liquid; K is 2.12 ergs per degree for a normal liquid. Cf. *Morgan* equation. **R.-Young equation.** An expression of the relation existing between the pressure, p, and absolute temperature, T, of a gas or homogeneous liquid, the volume being constant: $p = (kT - c)$, where k and c are constants. **R. and Young law.** The ratio of the boiling points of chemically analogous compounds at the same pressure is independent of the pressure: $A/B = A'/B'$, where A is the boiling point of compound a, B the boiling point of b at pressure x, A′ the boiling point of a, and B′ the boiling point of b at pressure y, hence $a_x/b_x = a_y/b_y$.

Ramsden ocular. See *ocular.*

rancid. Having the peculiar tainted smell of oily substances which have begun to spoil. Rank and sour from chemical decomposition; as rancid butter.

rancidity. A condition of partly-decomposed fats or oils, due to the formation of free fatty acids.

Raney's alloy. An alloy (Ni 30, Al 70) used in place of Devarda's alloy (q.v.) for the determination of nitrates by reduction to ammonia. **R. catalyst.** Ni_2H.(?) R. nickel. A highly-active, finely-divided nickel catalyst, prepared by dissolving the Al out of R. alloy by alkali; used for hydrogenating organic compounds.

Rankine scale. A thermometer scale based on absolute zero of the Fahrenheit scale; $-460°F = 0°R$; or $(t_F + 460) = x°R$. It corresponds with the Kelvin scale based on the Centigrade scale.

rankinite. $3CaO.2SiO_2$. A natural calcium silicate from Ireland; it is a constituent of high-lime blast furnace slags.

Ranunculaceae. The crowfoot family, a group of herbaceous or shrubby plants with an acrid juice. Some of the species are:

Cimicifuga racemosa	black cohosh
Hydrastis canadensis	golden seal
Actaea alba	white cohosh
Actea spicata	helleborin
Coptis trifolia	gold thread
Helleborus niger	black hellebore
Helleborus viridis	green hellebore
Xanthorrhiza apiifolia	yellow root
Anemone pulsatilla	pasque flower
Adonis vernalis	false hellebore
Ranunculus bulbosus	butter cup
Delphinium staphisagria	stavesacre
Delphinium consolida	larkspur seeds
Nigella damascena	nigella
Nigella sativa	nigella
Aconitum napellus	monkshood
Anemone hepatica	liverwort
Paeonia officinalis	peony

Cf. *aconite alkaloids, Clematis, Delphinium, macrocarpine, thalicitrine.*

ranunculine. An alkaloid from *Ranuncula* species. It is a cardiac poison.

Raoult, François Marie. 1830–1901. A French chemist noted for his generalizations in physical chemistry. **R.'s law.** (Cf. *Blagden's Law, Coppet's law.*) The lowering of the freezing point or of the vapor pressure of a solution is proportional to the amount of substance dissolved in the solution:

$$\frac{p_0 - p}{p_0} = \frac{n}{N + n} = \frac{aM}{bm},$$

where p is the vapor pressure of the solution; p_0, that of the pure solvent; n, the number of molecules of dissolved substance; N, the number of molecules of solvent; a, the weight in grams of the solute of molecular weight, m; b, the weight in grams of the solvent of molecular weight, M. It is thus possible to determine the molecular weight of a substance from the lowering of the vapor-pressure of its solution.

*ra***P.** Radiophosphorus.

rape seed oil. Colza oil, rape oil. A brown, viscous, fixed oil expressed from the seeds of rape, *Brassica napus*, a Cruciferae. It has an unpleasant odor, $d._{25}^{25}$0.906–0.910, solidifies at −2 to −10°C, m.20, soluble in alcohol, ether or chloroform. Used as a lubricant, in the heat treatment of steel, and in the manufacture of rubber substitutes.

raphia. Raffia. A fiber peeled from the leaves of *Raphia pedunculata*, a palm of Madagascar; used for making mats and basketry.

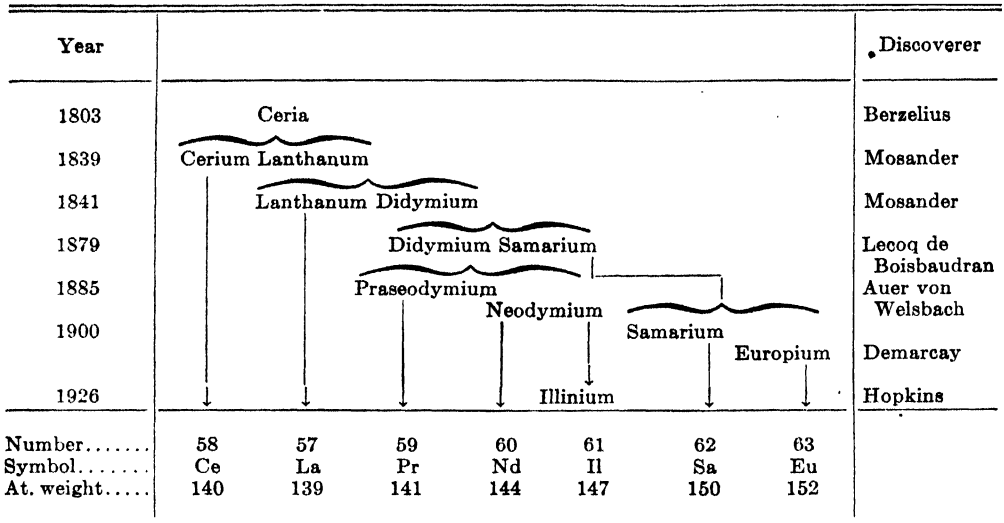
raphides. Small crystals of calcium oxalate in plants.

rapic acid. Rapinic acid.

rapinic acid. $C_{18}H_{34}O_2$ = 282.27. An unsaturated, monobasic acid and isomer of oleic acid, probably identical with petroselinic acid, in rape seed oil.

rare. Not common. **r. earths.** (1) The oxides of the r. earth metals; as, ceria, holmia. (2)

1. RARE EARTH METALS OF THE CERIA GROUP



In a wider sense, the oxides of Sc, Y, La and even of Hf, Zr, Th. **r. earth metals.** The metallic elements, atomic numbers 57 to 71, of the periodic system. They are grouped in two classes, the ceria earths and yttria or gadolinite earths, and are closely similar in physical and chemical properties, forming one group in the periodic system. The rare earth group differs from all other groups of the periodic system because its elements have consecutive atomic numbers. (See tables.) **r. e. minerals.** The rare earth metals generally occur associated with one another as phosphates and silicates; *e.g.*,

zircon..... $ZrSiO_4$
thorite..... $ThSiO_4$
monazite..... $CePO_4$
gadolinite..... $Be_2FeYt_2Si_2O_{10}$
cerite..... $H_3(Ca,Fe)Ce_2Si_2O_{13}$
orthite..... $AlOHCa_2(Al,Fe,Ce)_2(SiO_4)_3$

Each of these minerals is always accompanied by a number of the other rare earths. Cf. *bastnasite, fergusonite, fluocerite, rowlandite, rutherfordite, samarskite, sipylite, xenotime, yttriotantalite.*

rare gases. The noble gases (He, Ne, A, Kr, and Xe).

rarefaction. The act of making less dense, either by increasing the volume without changing the amount of gas, or by decreasing the amount of gas in a certain volume; as, with a vacuum pump.

rarefied. Describing a gas at lower pressure than atmospheric.

rasmosin. A resin from the root of *Cimicifuga racemosa*, a Ranunculaceae.

rasorite. $Na_2B_4O_7.4H_2O$. Kernite. A hydrated sodium borate found native in California. Colorless monoclinic crystals, d.1.908, hardness 2.5.

raspberries. The fresh ripe fruits of *Rubus idaeus*, a Rosaceae; used as food and in pharmaceutical preparations.

raspberry leaves. The dried leaves of *Rubus* species; used as the fluid extract, as an astringent.

rat. White rat, *Rattus norvegicus*, used in animal experiments. **r. unit.** (1) The minimum quantity of pituitary hormone which will cause the formation of one or more corpora lutea within 96–100 hrs., when injected subcutaneously in six doses, twice daily for three days, in female white r. 30 days old. (2) A method of expressing the vitamin A potency of a substance in terms of its therapeutic effect on rats.

ratafia. A cordial prepared by crushing and steeping fruit kernels.

ratany. Krameria.

ratholite. Pectolite.

rate. The relative degree of speed. **r. of decomposition, r. of formation.** The velocity of a chemical, reaction expressed in mols per second per cc. or in mols per hour per liter.

ratio. Proportion.

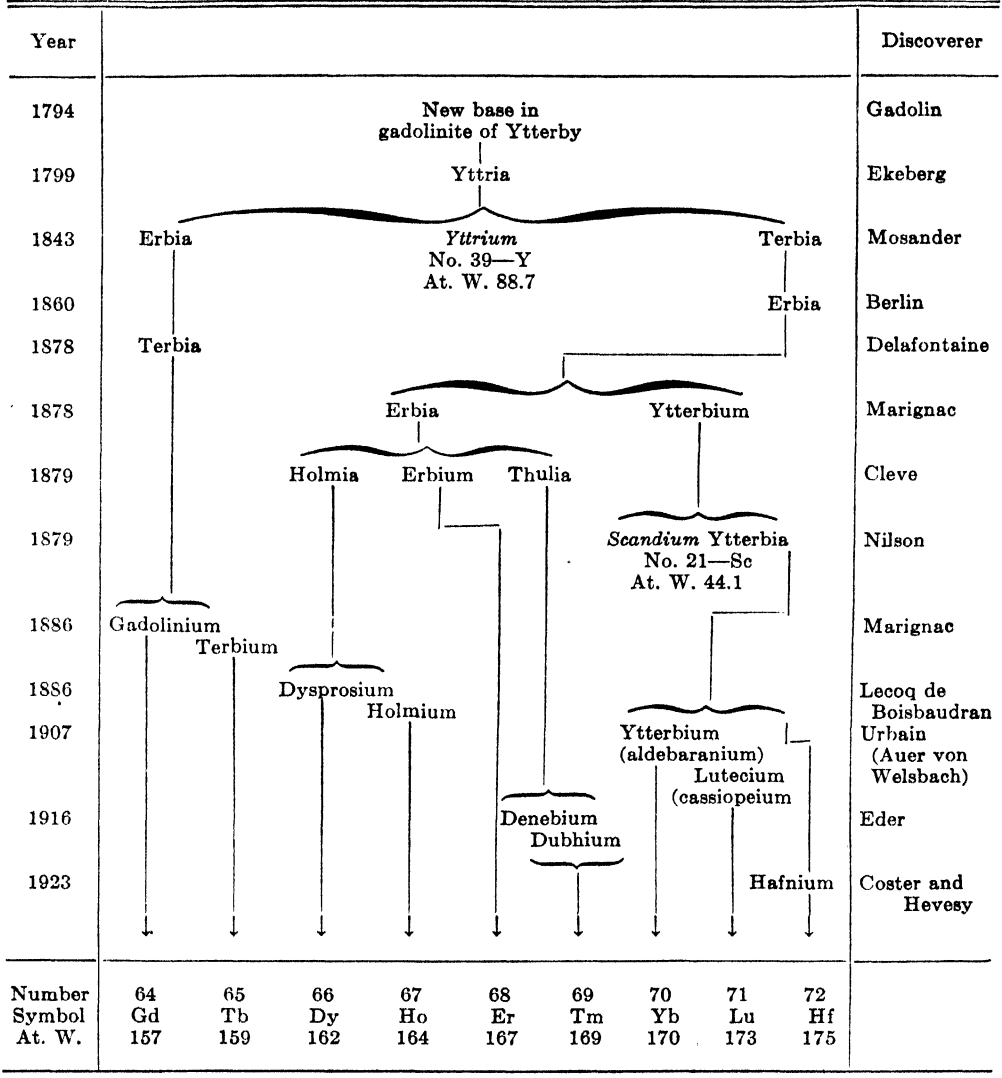
ration. The daily allowance of food and drink.

rational. Based on reasoning and not on direct experience. **r. analysis.** The expression of analytical results in such a way that the method of combination of the elements is indicated (*e.g.*, water analysis), as compared with ultimate analysis in which their quantities are returned. Thus, clay would be expressed in terms of calcium silicate, rather than as Ca, Si and O. Cf. *ultimate.* **r. formula.** A combination of chemical symbols that indicates the way in which the atoms are probably linked in the molecule. It is less elaborate than the structural formula, and more definite than the empirical formula. In a rational formula; such as, $Fe_2(SO_4)_3$, NH_4OH, C_2H_5OH, CH_3COOH, the atoms are grouped into one or more radicals. **r. units.** See *ultimate units.*

rattlesnake root. Senega. **r. venom.** The poisonous proteins from the fangs of *Crotalus* species. (Antidote: external application of potassium permanganate.)

Raulin's solution. A culture fluid for fungi, molds, etc. consisting of 70 gm. sucrose, 4 gm. tartaric acid, 4 gm. ammonium nitrate, 0.6 gm. ammonium phosphate, 0.25 gm. ammonium sulfate, 0.07 gm. potassium silicate, 0.6 gm. potassium carbonate, 0.4 gm. magnesium

2. RARE EARTH METALS OF THE YTTRIA GROUP

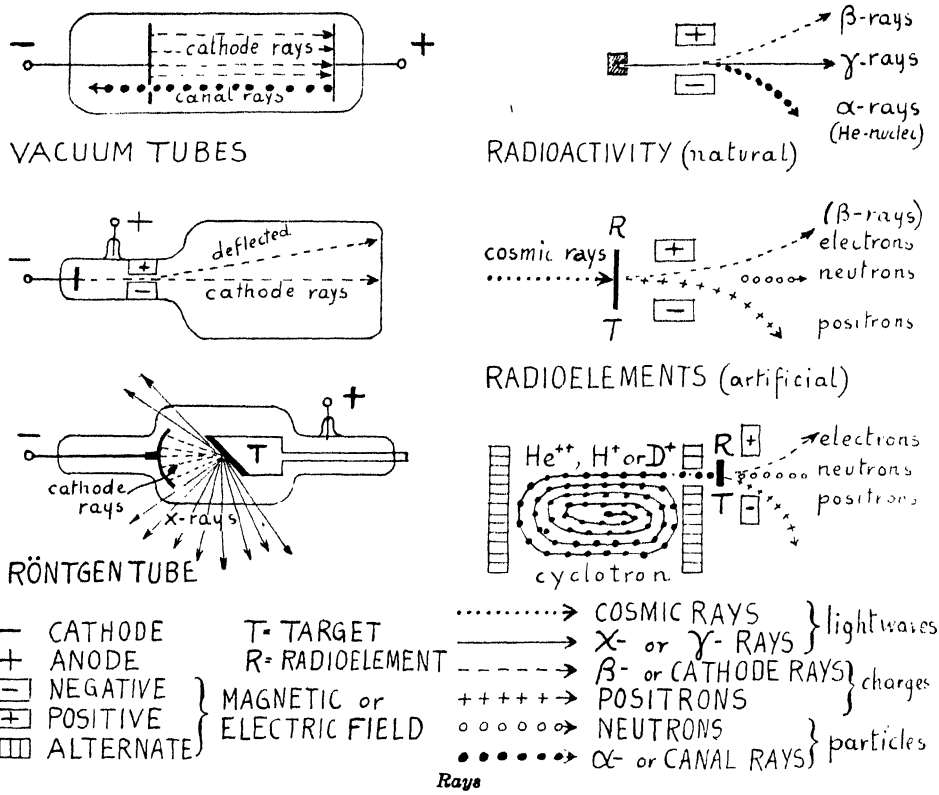


carbonate, 0.07 gm. zinc sulfate and 0.08 gm. ferric sulfate per liter.

rauwolfine. $C_{20}H_{26}N_2O_3.2\frac{1}{2}H_2O$ = 387.2. An alkaloid, decomp. 235, from the bark of *Rauwolfia caffra*, an Apocynaceae.

raw. Crude or unfinished. **r. material.** A material from which useful substances or compounds can be made. **r. ore.** An ore in the state in which it is won.

ray. A pencil or beam of light, heat, or rapidly-moving particles. Cf. *radiation*, and illustration. **absorbed-** A light ray transformed into heat (molecular motion) by passing through matter. **actinic-** Chemically-active light, especially ultra-violet light. **alpha-** Alpha-particles. Positively-charged helium nuclei moving at great velocity and produced by the disintegration of radioactive elements. They are similar to canal rays. **Becquerel-** The x-rays produced as a result of the disintegration of radioactive elements; they affect a photographic plate. **beta-** Negatively-charged electrons, moving at great velocity and produced by the disintegration of radioactive elements. They are identical with cathode rays. **Blondlot-n-*Rays*.** **canal-** Positively-charged particles, similar to alpha-particles, but produced by an electric discharge through an evacuated tube having a perforated cathode through which the particles pass. **cathode-** Negatively-charged particles or electrons, moving at great velocity at right angles to the cathode of a vacuum tube and causing the emission of x-rays whenever they strike a solid. They are similar to the beta-rays of radioactive substances. **chemical-** Actinic-. **cosmic-** Millikan rays, ultra-gamma or ultra-x-rays. Radiations of extremely short wave lengths coming from all directions of space toward the earth's surface. **extraordinary-** See *ordinary-*. **gamma-** The x-rays produced by the impact of the beta-rays emitted by radioactive elements against a solid. **hard-** X-rays of short wavelength; they have greater penetrating powers than the



Rays
showing methods of production and relationships.

soft-. **heat-** See *infrared-*. **infrared-** The radiations beyond the red portion of the visible spectrum; they have greater wave lengths than this portion, and are heat radiations. **K-** See *K-radiations*. **L-** See *L-radiations*. **Lenard-** Residual cathode rays that pass from the vacuum tube into the atmosphere through specially-prepared windows of thin metal foils. **M-** See *M-radiations*. **Millikan-** See *cosmic-*. **molecular-** See *molecular rays*. **n-** Blondlot rays. A non-luminous radiation emitted from certain flames, that produces fluorescence when it strikes certain substances. **negative-** Cathode- or beta-. **od-** The radiations of living organisms. Cf. *scotography*. **ordinary-** See *ordinary*. **phonic-** Sound waves. **photic-** Visible light rays. **positive-** Canal- and alpha-. **Röntgen-** X-rays. **secondary-** Radiation produced after a primary ray strikes matter. **soft-** Any x-ray of long wavelength that has low penetrating powers. **ultimate-** See *raies ultimes*. **ultragamma-** See *cosmic r.* **ultraviolet-** The radiations from the portion beyond the violet end of the visible spectrum; they are of shorter wavelength than visible violet and produce fluorescence. **u.v.-** Ultraviolet-. **w-** R. between u.v.- and **x-**. **x-** Röntgen rays. A form of non-luminous radiation, usually produced by cathode rays striking a solid. It is assumed to be the ether disturbance caused by the bombardment of the negative electrons when they collide with the molecules of the solid substance. Cf. *x-rays*.

Ray, Sir Prafulla Chandra 1861–1944. A Hindu chemist, noted for his work on the organic nitrites and history of chemistry.

Rayleigh, (John, William Strutt) Lord. 1842–1919. An English physicist, noted for the discovery of the noble gases, and determinations of the densities of gases. **R., Lord Robert John** 1875– . An English physicist noted for his work on radioactivity and optics.

rayolanda. Trade name for a chemically-modified viscose rayon.

rayon. Artificial silk or any artificial substance whose chief ingredient is cellulose or one of its derivatives. Thread, yarn or fiber, made from cellulose derived (*e.g.*, from wood or cotton) chemically treated. Four main types: (1) **acetate r.** The acetic ester of cellulose. It is prepared by treating the cellulose of cotton or wood pulp with acetic anhydride, acetic acid and concentrated sulfuric acid in presence of a catalyst, precipitating with water and dissolving in acetone, from which it is spun. Trade names are celanese and lustron. (2) **cuprammonium r.** (**glanzstoff** or Pauly) is made by dissolving cotton or wood pulp in an ammoniacal copper solution, which is ejected through fine orifices into a setting bath of dilute sulfuric acid. (3) **nitrocellulose r.** (Chardonnet) is prepared by treating cotton with nitric and sulfuric acid, dissolving the resulting trinitrocellulose in alcohol and ether (collodion solution) and ejecting through fine nozzles into water or warm air. The inflammable filaments are in turn denitrated by treatment with sodium hydrosulfide. (4) **viscose r.**; the commonest process of making r. involves soaking bleached spruce pulp or cotton linters in 18 % caustic soda solution, treating the soda cellulose

with carbon disulfide (**xanthation**) dissolving in caustic soda (**viscose**), and finally forcing the viscose through fine outlets into a setting and bleaching bath. The total World output of rayon in 1940 was 450,000 tons; the U. S. and Japan were the biggest single producers.

razor stone. Novaculite.

Rb. The symbol for rubidium.

rd. An abbreviation for rod.

Re. The symbol for rhenium.

Ré. Abbreviation for Réaumur.

react. To enter into a chemical combination.

reactants. The original molecules that act upon one another to form a new set of molecules (resultants).

reacting. Undergoing a reaction. **r. weight.** Equivalent weight.

reaction. (1) That force which tends to oppose a given force (Newton's Laws). (2) The acidity (q.v.) or alkalinity of a solution. (3) Any chemical change, or the transformation of one or more molecules (reactants) into other kinds of molecules (resultants). Reactions may be grouped into: (1) *synthetic* (combination and addition); (2) *analytic* (decomposition and dissociation); (3) *metathetic* (an interaction of molecules as neutralization, precipitation, substitution, displacement). Modern theory places r. in two types:

I. **Proton-** or *acid/base-*, where a hydrogen ion is either liberated or bound:

$$A \rightleftharpoons B + H^+.$$

This equilibrium is maintained by buffers (q.v.), and measured by p_H-values. Cf. *displacement series.*

II. **Electron-** or *oxidation/reduction-*, where an electron is transferred from one atom to the other:

$$A \rightleftharpoons B + e \qquad \text{or} \qquad H + e.$$

This equilibrium is maintained by poisers (q.v.), and measured by r_H-values. Cf. *redox series.* Another division is: (A) reactions in which there is no change of valence of the participating atoms, and (B) reactions that involve a change of valence, and are generally spoken of as oxidation and reduction or electronation reactions. The general types of reactions are:

A. Reactions involving no oxidation and reduction.

1. Addition

(molecules combine to form a more complex molecule: $K_2O + SO_3 = K_2SO_4$)

2. Decomposition

(molecules break apart into simple molecules: $NH_4Cl = NH_3 + HCl$)

3. Metathesis

(interaction between molecules: $NaCl + AgNO_3 = AgCl + NaNO_3$)

4. Neutralization

(the interaction of an acid and base to form a salt and water:

$$M(OH) + HN = MN + HOH;$$

M is a metal, and N a nonmetal or acid radical.)

5. Hydrolysis

(the action of water on a compound, generally the reverse reaction of neutralization;

$$HOH + MN = MOH + HN)$$

B. Reactions involving oxidation and reduction (electronation). There is an increase in the valence number of one element, and a corresponding decrease in the valence number of another element; or one or more electrons pass from one atom to the other.

1. Combination

(element molecules unite and form a compound;

$$H_2 + Cl_2 = 2HCl)$$

2. Dissociation

(a compound molecule splits into element molecules: $2HI = H_2 + I_2$)

3. Displacement

(an element molecule interacts with a compound molecule; $Fe + CuSO_4 = Cu + FeSO_4$)

4. Substitution

(an element molecule interacts with a compound molecule: $Cl_2 + CH_4 = CH_3Cl + HCl$)

5. Restitution

(the reverse reaction of substitution:

$$2PbO + PbS = 3Pb = SO_2)$$

6. General oxidation and reduction

(interaction among molecules in which some atoms are oxidized and others reduced:

$$4HCl + MnO_2 = Cl_2 + MnCl_2 + 2H_2O)$$

C. Organic reactions are similar to inorganic reactions. According to Falk they take place by the intermediate formation of an addition compound, and if the reaction is catalytic, the catalyst is one of the components of the addition compound.

(a) The majority are metathetical reactions of the type:

$$BX + HA = BA + HX,$$

in which B is a base, metal or hydrogen, X the hydroxyl radical or a halogen, A a nonmetal or acid group. Thus (a) neutralization:

$$BOH + HA = BA + H_2O$$

(b) Friedel-Crafts reaction:

$$RX + HPh = RPh + HX,$$

where X is either OH or Cl, and the catalyst either $AlCl_3$, $ZnCl_2$, H_2SO_4 or HCl.

(c) Aldol condensation:

$$R.CHO + H_2CA_2 = R.CH{:}CA_2 + H_2O,$$

where A is a negative group on the alpha-carbon, and the catalyst is either zinc chloride, hydrochloric acid or an alkali.

(d) Esterification:

$$ROH + HA = RA + H_2O,$$

where R is an alkyl or aryl radical, and the catalyst either zinc chloride, sulfuric acid or hydrochloric acid.

(e) Etherification:

$$ROH + HOR' = ROR' + H_2O$$

(f) Amide formation:

$$AcOH + HNH_2 = AcNH_2 + HCl$$

where Ac is an acyl radical, and OH can be replaced by Cl, or the NH_2 group by an NR_2 group.

(g) Amine formation:

$$ROH + HNH_2 = RNH_2 + H_2O$$

where R is either an aryl or alkyl radical.

(h) Nitrocompound formation:

$$NO_2.X + HPh = NO_2Ph + HX$$

in which X is either OH, OEt, OSO_2H, or an acyl radical.

(i) Nitrosocompound formation:

$$NO.X + HPh = NOPh + HX$$

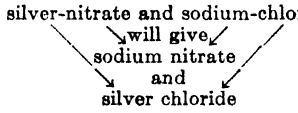
in which X is either OH, Cl or an OR group.
(j) Diazotization:

$$NO.X + H.NHR = ON:NHR + HX$$

where X is either OH or Cl, and R either an aryl or alkyl radical.

acid- A test for the presence of hydrogen ions or an acid; as, blue litmus turning red. **alkaline-** A test for the presence of hydroxyl ions or bases; as, red litmus turning blue. **amphoteric-** The reaction of a substance that has both acid and alkaline properties. **analytic-** R. which break down molecules. **analytical-** R. used in determining the quantity and/or quality of matter. **balanced-** A reversible reaction, which goes to completion in neither direction. **bimolecular-** A reaction of the second order. **Bunsen-** See *Bunsen.* **catalytic-** A reaction whose rate is accelerated by a catalyst. Cf. *induced-.* **chain-** See *chain, trigger.* **color-** A r. involving a change in color. **complete-** A chemical change that proceeds to completion; as, the precipitation of an insoluble compound. **complex-** Composite r. **composite-** A chemical change in which more than one reaction occurs simultaneously. **concurrent-** A chemical change that consists of a series of connected reactions, that could not occur separately. **condensation-** A reaction in which atoms are removed from two or more molecules, the residues combining to form a single molecule. **counter-** Reversible reaction. **coupled-** A concurrent reaction. **diazo-** See *diazo.* **endothermic-** A reaction in which heat is consumed. **exothermic-** A reaction in which heat is liberated. **flame-** See *Bunsen.* **group-** A typical reaction of a certain group of elements; as, in qualitative analysis. **heat of-** See *heat.* **heterogen(e)ous-** A composite r. **incomplete-** Balanced r. **induced-** A reaction that is accelerated by an inductor or promoter. **ionic-** An instantaneous reaction between ions in solution. **irreversible-** A reaction that proceeds to completion and cannot be reversed. **main-** The principal reaction. **metathetical-** A reaction in which there is an exchange of groups. **micro-** See *micro.* **molecular-** In general, a slow reaction occurring between molecules and not ions. **monomolecular-** A reaction of the first order. **negative-** The absence of r. **neutral-** A r. which is neither acid nor basic. **nuclear-** See *nuclear.* **opposing-** The reverse reaction in a balanced reaction. **photo-** See *photo.* **positive-** A r. which is definite. **primary-** The principal or main reaction that occurs in a composite system of reactions. **principal-** Primary r. **pyrogenic-** See *pyrogenic.* **qualitative-** q.v. **quantitative-** q.v. **reversible-** An incomplete r. A reaction that proceeds under certain conditions from right to left as well as from left to right. **secondary-** Subsidiary r. **side-** A reaction simultaneous with the principal reaction, and occurring between the same reactants but forming different products. **simultaneous-** Side r. **staircase-** See *staircase.* **subsidiary-** A reaction which occurs between the resultants of a reaction. **successive-** A reaction made up of a number of component reactions which occur in succession, the reactants being in turn the resultants of the preceding reaction. **sympathetic-** Induced reaction. **synthetic-** A reaction in which simple molecules combine to form a more complex molecule. **topochemical-** See *topochemistry.* **trigger-** q.v.

r. control. (1) The factors controlling the speed of a reaction are concentration (amount of substance present) and energy relations (potential energy, electromotive force and free energy). A reaction can be accelerated by: (a) *Mechanical* means, by increasing the number of molecules coming in contact with one another; by increasing the surface by subdivision (colloidal state) or mechanical catalysers, increasing the pressure of gases, or in general, increasing the concentration of the reactants and removing the resultants. (b) *Thermal* means, by increasing the velocity of the molecules by heating, and, thus, increasing the frequency of molecular collisions and the speed of the reaction. (c) *Electrical* means, by electrolysis and electrolytic displacement. (d) *Optical* means, by activation, excitation or irradiation. (2) Reaction, in the sense of acidity, is controlled by buffer solutions (q.v.). **r. equations.** An expression of a chemical change: (A) *Graphical* method, a popular illustration of the exchange taking place:



(B) *Molecular* method, which indicates the weight relations of the reacting substances:

$$AgNO_3 + NaCl = AgCl + NaNO_3$$

(C) *Ionic* method, a generalized statement of the actual change, or representing action as it takes place between ions of dissociated reacting molecules:

$$Ag^+ + Cl^- = AgCl.$$

r. isochore. An equation that indicates the relation of temperature to the equilibrium constant (K) at constant volume (or pressure, of a gas): $\frac{d(\ln K)}{dT} = -\frac{U}{RT^2}$. (ln K) is the natural logarithm of K at absolute temperature, T; U, the decrease in total energy or heat quantity at this temperature; R, the gas constant. By integration this decrease in energy can be calculated from the equilibrium constants, K_1 and K_2, at the temperatures, T_1 and T_2, respectively.

$$(\ln K_2) - (\ln K_1) = \frac{U}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right).$$

The maximum work at any temperature can thence be determined. **r. isotherm.** An equation that indicates the maximum external work or diminution in free energy that can be obtained from a given chemical reaction at constant temperature and volume: $A = RT \log K - RT\Sigma v \log C$, where A is the decrease in free energy and $RT\Sigma_v \log C$ represents the concentration. (See also *mass action, equilibrium.*) It holds for ideal gases only. A is a measure of the affinity of the reaction. **r. law** If a system in equilibrium undergoes a restraint a change tends to take place, which, if it is a possible change, partly annulls the constraint. **r.**

order. A division of reactions into several types:

First order, mono- or unimolecular reactions—a reaction in which only one molecule reacts: A = one or more products. The velocity of such reactions is expressed by

$$\frac{dx}{dt} = k(a - x)$$

where a is the initial amount of substance, x, the amount that has changed after time, t, and k is the velocity constant. This expression on integration becomes

$$k = \frac{1}{t} \ln \frac{a}{a - x}, \text{ or } k = \frac{1}{t_2 - t_1} \ln \frac{a - x_1}{a - x_2}$$

when x_1 and x_2 are the amounts that have changed after times t_1 and t_2, respectively.

Second order, bi- or di-molecular reactions—reaction in which two molecules undergo a change:

2A = one or more products; or
A + B = one or more products.

The velocity is expressed by $dx/dt = k(a - x)(b - x)$, which, on integration, becomes

$$k = \frac{1}{(a - b)t} \ln \frac{(a - x)b}{(b - x)a},$$

$$\text{or } k(a - b) = \frac{1}{t_2 - t_1} \ln \frac{a - x_2}{b - x_2} - \ln \frac{a - x_1}{b - x_1}$$

However, if a = b, then

$$k = \frac{1}{t} \cdot \frac{x}{a(a - x)}$$

Third order, tri- or termolecular reactions—a reaction in which three molecules undergo a change:

3A = one or more products.
2A + B = one or more products.
A + B + C = one or more products

The velocity of these reactions is $dx/dt = k(a - x)(b - x)(c - x)$, and on integration, if a = b = c

$$k = \frac{1}{2t} \left[\frac{1}{(a - x)^2} - \frac{1}{a^2} \right]$$

Fourth order, tetra- or quadrimolecular reactions—a reaction in which four molecules undergo a change:

4A =	one or more reaction-products
3A + B =	one or more reaction-products
2A + B + C =	one or more reaction-products
A + B + C + D =	one or more reaction-products

r. promoter. Promoter. **r. sensitivity.** That dilution at which a reaction may be carried out and still give identifiable end-products. **r. velocity.** Velocity constant. The time rate at which molecules change or are transformed in a chemical reaction. (See *reaction order.*)

reactivation. The rendering active again of a catalyst or serum which has become inactivated. Cf. *revivification.*

reactivity. The capacity to react.

reading telescope. A one-tube telescope placed below a meter scale, through which the image of the scale in a mirror is read. The slightest deflection of the mirror can be determined, and is often used in very delicate measurements; as, sensitive galvanometer measurements.

reagent. A substance used for the detection or determination of another substance by chemical or microscopical means; especially those substances or their solutions which are used in qualitative or quantitative analysis. Reagents may be divided into:

1. precipitants—which produce an insoluble compound.
2. solvents—which are used to dissolve water-insoluble materials.
3. oxidizers—which are used in oxidation.
4. reducers—which are used in reduction.
5. fluxes—which are used to lower the melting points of substances.
6. Colorimetric reagents—which are analogous to 1., but produce coloured soluble compounds.

(See also *volumetric solutions*, *standard solutions*, *normal solutions.*) **r. solution.** The aqueous solution of a r. substance used in the laboratory; usually about 10 % concentration.

realgar. As_2S_2. Ruby sulfur, red arsenic, red orpiment. A red or orange native arsenic disulfide; monoclinic prisms.

rearrangement. Molecular conversion, migration, or transposition. An intramolecular change, or reaction in which the atoms or atomic groups of the molecule redistribute themselves or arrange themselves in a different manner. Cf. *pinacol*, *enol-ketone*, *semidine.*

Réaumur, René Antoine Ferchault de. 1683–1757. A French natural philosopher, noted chiefly for his invention of a thermometer scale. **R. degree.** °R or °Ré. A thermometer scale based upon the freezing point of water = 0°R. and the boiling point of water = 80°R.; hence, 80°R. = 100°C.

recalescence. An increase in the emission of visible light during the cooling of molten metals; the brighter glow of a molten substance at certain temperatures. It is explained by thermally excited electrons falling back to a lower energy level in the atom. Cf. *luminescence.*

recalescent point. The temperature at which evolution of heat occurs during the cooling of steel. It is lower than the decalescent point (*q.v.*) by an amount which is a measure of the hysteresis of steel.

recarbonize. To restore the carbon content of steel after decarbonizing.

recarburize. Recarbonize.

receiver. A vessel in which the products of a distillation are collected.

receptacle. A receiving-vessel.

receptors. A radical or atom on the surface of the protoplasmic, colloidal molecule that fixes drugs or poisons and thereby renders them effective. Compare *Ehrlich side-chain theory.*

reciprocal. The quotient, r, obtained by dividing unity by a number, n: $r = 1/n$; hence any function or expression so related to another that their product is unity: $rn = 1$. **r. ohm.** The unit of conductivity, mho, q.v. **r. salt pair.** Two salts which may act either as the reactants or resultants of a reaction; as,

$$NaCl + KNO_3 \rightleftharpoons NaNO_3 + KCl$$

reciprocating motion. Motion to and fro in a straight line, like that of the piston of a steam engine.

reciprocity law. Bunsen and Roscoe law.

recoil. Return motion. **r. atom.** The atom of a radioactive substance in the process of expelling an α-particle. On account of the high velocity with which the helium nucleus is shot off, the residue of the atom recoils. **r. radiation.** A radiation produced by bombarding gaseous atoms with alpha-particles, and having its source in the action of the recoil atom. Cf. *Wilson tracks.*

reconstituted milk. Reconstructed milk.

reconstructed milk. A beverage obtained by emulsifying unsalted butter in a solution of skimmed milk powder. Gelatin is sometimes added as a stabilizer.

recovery. The extraction of valuable constituents from a raw material, by-product, or waste-product; as, copper extracted from ores, silver precipitated from photographic wastes.

recrystallization. Repeated crystallizations for the purpose of purification.

recrystallize. To purify a substance by repeated crystallization.

rectification. (1) The redistillation of a liquid for the purpose of purification. (2) The transformation of an alternating- into a direct-current. (3) The evaluation of the length of a curved line.

rectified spirit. Spirits of wine. Redistilled alcohol, which contains 84 % by weight of absolute alcohol, is 50°O.P., and has a specific gravity of 0.8382 at 60°F. Cf. *proof spirit.*

rectifier. An electric valve which converts alternating current to direct current; *e.g.*, aluminum r., quartz r., electron valve or transformer. **Dryr-** An asymmetric conductor consisting of a disc of lead sulfide waxed on one side and making contact on both sides with tin foil. **r. cell.** Photo-electric cell.

rectorite. A white aluminum silicate, similar to kaolinite.

recuperator. Regenerator.

red. The least refracted portion of the visible spectral colors. **r. acid.** *1.5*-Dihydroxy-naphthalene-*3.7*-disulfonic acid. **r. antimony.** Kermesite. **r. arsenic.** Realgar. **r. bark.** Red *cinchona.* **r. bole.** Red ocher. **r. brass.** An alloy of 78–83 % copper, 7–9 % zinc, 6–10 % lead, 4–2 % tin. **r. cedar.** Juniper. **r. chalk.** Red ocher mixed with clay. See *red hematite.* **r. chrome.** Lead chromate. **r. cobalt.** Erythrite. **r. copper ore.** Cuprite. **r. couch grass.** Carex. **r. hematite.** See *hematite.* **r. iron ore.** Hematite. **r. lead.** Lead tetroxide. **r. lead ore.** Crocoisite. **r. liquor.** A solution of aluminum acetate, used in dyeing. **r. manganese.** Rhodonite. Rhodochrosite. **r. mercury iodide.** Mercuric iodide. **r. mercury oxide.** Mercuric oxide. **r. metal.** A copper alloy. **r. mustard.** Sinapis nigra. **r. ocher.** Reddle, red bole. A red, often impure, variety of hematite, used as a pigment. **r. oil.** Commercial oleic acid. **r. orpiment.** Realgar. **r. oxide.** Iron sesquioxide. **r. oxide of zinc.** Zincite. **r. pepper.** Capsicum. **r. phosphorus.** See *phosphorus.* **r. pigments.** See *antimony red, carmine, chrome red, realgar, red ocher, venetian red, and vermilion.* **r. precipitate.** Mercuric oxide. **r. prussiate.** Ferricyanide. *r.p. of potash.* Potassium ferricyanide. *r.p. of soda.* Sodium ferricyanide. **r. root.** Sanguinaria. **r. sensitive plate.** A photographic plate that has been made orthochromatic by the addition of a sensitizer, as neocyanine or kryptocyanine, to the emulsion. **r. silver ore.** Pyrargyrite. Proustite. *dark-* Pyrargyrite. *light-* Proustite. **r. stone.** Ferric oxide. **r. vitriol.** Bieberite. **r. zinc ore.** Zincite.

reddingite. A native iron and manganese phosphate from Redding, California.

reddingtonite. A native chromium sulfate.

reddle. Hematite.

redistillation. Repeated distillation of a liquid.

Redonda phosphate. A rich phosphate ore from the West Indies, 40 % P_2O_5.

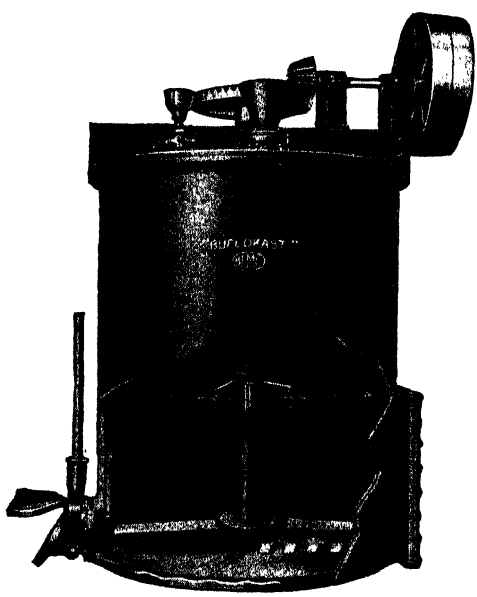
redox. Reduction-oxidation or electronation. **r. equilibrium.** Describing a reaction which is poised at a definite r_H-value. Cf. *poising agent, oxido-reduction potential.* **r. indicator.** See *indicator.* **r. series.** A table of oxidizing and reducing reactions arranged in order of intensity.

redruthite. Cu_2S. A black mineral.

reduce. To add one or more electrons to an atom (electronate). Hence: (a) to decrease the valence number of an atom by means of a corresponding increase in the valence number of another atom (which is oxidized); (b) to deprive of oxygen or to produce the metallic state; (c) to add hydrogen to an element or compound. Antonym: *oxidize.*

reduced. (1) Brought or restored to metallic form. (2) Brought to a lower stage of oxidation, q.v. **r. iron.** Finely-powdered metallic iron obtained by heating ferric oxide in a current of hydrogen. **r. oil.** Crude petroleum from which the hydrocarbons of lower boiling-points have escaped by evaporation, or have been removed by distillation.

reducer. (1) Reducing agent. (2) A solution which decreases the intensity of a photographic



Reducer.

image, as a fresh mixture of equal parts of 10 % sodium thiosulfate and 3 % potassium ferricyanide solutions. (3) A cast iron kettle,

with a power-driven stirring device, used in large scale reductions. **Jones-** An apparatus for reducing ferric iron to ferrous iron by passing the solution through granulated zinc. Cf. *reductor.*

reducible. Capable of being reduced.

reducin. $C_{12}H_{24}N_6O_8$. A leukomain derived from urochrome.

reducing agent. Reducer. A substance that is readily oxidized (loses a valence electron) and, thereby, reduces another substance (which gains a valence electron). The common reducing agents are nascent hydrogen, hydrogen sulfide, sodium sulfite, stannous chloride, hydriodic acid, ferrous chloride, sodium amalgam, sulfur dioxide, formaldehyde and zinc dust. Cf. *oxidizing agents.* **r. flame.** The luminous portion or inner cone of the blowpipe flame or the bunsen burner in which there is an excess of unburnt carbon or hydrocarbon gas, which acts as a reducing agent on the minerals or substances brought into contact with it. **r. furnace.** A shaft furnace in which ores are reduced to metals. **r. sugar.** A mono- or di-saccharide (as, glucose or fructose) that reduces copper or silver salts in alkaline solutions. Cf. *Fehling's solution.*

reductase. An enzyme that acts as a reducing agent.

reductic acid. See *reductones.*

reduction. (1) Making less or smaller. Converting to a fine state. Reproducing on a smaller scale. (2) Describing a chemical reaction in which one or more valence electrons are added to an atom. This process is the exact reverse of oxidation, and both occur concurrently. Types of reduction are illustrated in the following particular cases. (3) In particular: (A) The removal of oxygen from a compound; as, a change from CuO to Cu (the copper atom gains two electrons), from R.COOH to R.COH, from $MClO_3$ to MClO. (B) The addition of hydrogen to an element or compound; as, a change from Mg to MgH_2, from CH:CH to $CH_3.CH_3$, from R.CHO to $R.CH_2OH$. (C) The change from a state of higher valence to one of lower valence; as, from the ferric to the ferrous state or to metallic iron, from the cupric to the cuprous state or to metallic copper, from chlorine to a chloride. These reactions are written:

$$Fe^{+++} + 1(-) = Fe^{++}$$
$$Fe^{++} + 2(-) = Fe$$
$$Cu^{++} + 1(-) = Cu^{+}$$
$$Cu^{+} + 1(-) = Cu$$
$$Cl_2 + 2(-) = 2Cl^{-}$$

In these equations the symbol (−), denotes an electron, or negative charge which will neutralize a positive charge. The atom which gains the electron is reduced, while the atom which loses it is oxidized. Compare *oxidation, electronation, redox.* **r. intensity.** r_H. See *oxido-reduction potential.* **r. oxidation.** See *redox.* **r. potential.** The potential obtained when a platinum electrode is immersed in a solution containing an ion that is being reduced.

reductones. Apparent vitamin C. Reductic acid. Reducing substances present in dehydrated foods, or produced by the action of hot alkali on carbohydrates. They react very similarly to ascorbic acid, and therefore interfere with its determination by the titration method.

reductor. (1) An apparatus used for a reducing reaction; as, **Blair-** or **Jones-** (q.v.). A glass apparatus for the rapid determination of phosphorus in steel. (2) A metal or metal amalgam, which can act as a reducing agent.

Redwood number. A unit which measures viscosity in terms of rate of flow from a standard Redwood viscometer. It is standard in Great Britain for oils.

Reech's theorem. The ratio of the adiabatic to the isothermal elasticity of a fluid equals the ratio of the specific heats at constant pressure and at constant volume. For monatomic gases this ratio is 1.66.

refikite. $C_{20}H_{16}O_2$. A white, soft, native resin, in lignite.

refine. To free from impurities.

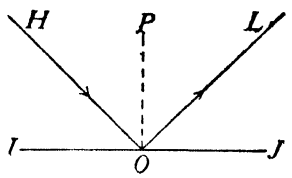
refined. Purified or freed from foreign matter.

refinery. (1) A building or apparatus used for refining purposes. (2) A shallow hearth furnace for making wrought iron.

refining heat. The temperature, 655°C., that imparts fineness of grain and toughness to steel.

reflected. Thrown back.

reflection. The rebounding of light, heat or sound radiations from a surface in the same



Reflection.
I = *reflecting* surface
H = incident ray
L = *reflected* ray
P = perpendicular, or normal.
HOP = angle of incidence
POL = angle of *reflection*

form, and unchanged both in quality and quantity.

reflector. (1) A mirror. (2) A device used to cast back light, heat or sound radiations.

reflux. A backward flow or return of a current. **r. condenser.** A vertical or inclined condenser, from which the condensed liquid flows back into the distilling vessel. **r. valve.** A check valve.

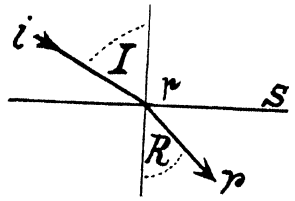
Reformatzky reaction. A condensation reaction between ketones and alpha-bromo-aliphatic acids in the presence of zinc or magnesium:

$$R_2CO + BrCH_2COOR + Zn \rightarrow$$
$$R_2C(OZnBr)CH_2COOR + H_2O \rightarrow$$
$$(ZnO.HBr) + R_2C(OH)CH_2COOR$$

refract. To change the direction, deviate or bend.

refraction. The deflection or change of direction impressed on rays of light obliquely incident on, or passing through a boundary between, two transparent media, or traversing a medium of varying density. Cf. *light, diffraction.* **atomic-** See *refractivity.* **double-** Birefringence. The property of having more than one refractive index, according to the direction of the traversing light. It is possessed by all except isometric crystals; by transparent substances which have undergone internal strains (*e.g.*, glass); and by substances which have different struc-

tures in different directions (*e.g.*, fibres). **electrical-** See *Kerr effect.* **specific-** See *refractivity.* **index of-** See *refractive index.*



Refraction.
i = incident ray
r = *refracted* ray
p = point of incidence
I = angle of incidence
R = *angle of refraction*
s = *refracting surface*

refractive. Refringent. Pertaining to refraction. **r. constant.** The sum of the refractivities of the pure constituents of a solution, each multiplied by the ratio of its mass per unit volume of solution to its own density when pure. **r. index.** (n.) The ratio of the velocity of light in a certain medium compared with its velocity in air under the same conditions. It is measured by the ratio of the sine of the incident angle to the sine of the angle of refraction; hence, n = sin i/sin r. In practice it is estimated by immersion of the crystal in a series of liquids of known n until a liquid is found in which the crystal is invisible. Such liquids are:

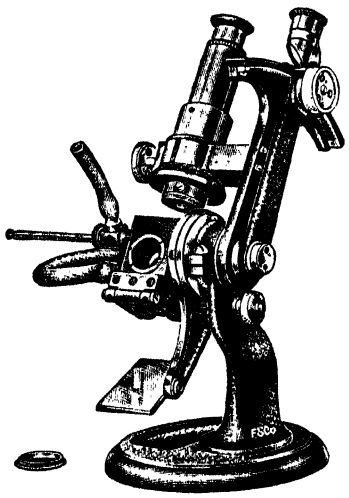
Liquid	n_D at 23°C
methyl alcohol	1.3279
water	1.3328
acetone	1.3598
hexane	1.3750
heptane	1.3868
ethylene chloride	1.4417
chloroform	1.4430
trimethylene chloride	1.4470
cineol	1.4552
glycerol	1.4671
decahydronaphthalene	1.4750
iso-amyl phthalate	1.4870
tetrachloroethane	1.4912
xylene	1.4957
benzene	1.4982
pentachloroethane	1.5006
anisole	1.5150
chlorobenzene	1.5218
trimethylene bromide	1.5220
ethylene bromide	1.5353
o-nitrotoluene	1.5440
nitrobenzene	1.5506
xylidine	1.5559
tri-o-cresyl phosphate	1.5560
bromobenzene	1.5578
o-toluidine	1.5700
aniline	1.5840
bromoform	1.5940
quinaldine	1.6088
iodobenzene	1.6168
cinnamaldehyde	1.6190
quinoline	1.6239
α-chloronaphthalene	1.6318
α-bromonaphthalene	1.6569
methylene iodide	1.7400

Absolute r. i. This refers to a vacuum, and equals: n × 1.0029.

refractivity. The phenomenon of light changing its direction when passing at an angle through media of different densities; it is expressed as (n − 1), where n is the refractive index. **atomic-** The refractive power of an atom calculated from the refractivity of its compounds by multiplication of the refractive index by the atomic weight. **molecular-** The refractive power of a molecule calculated either by adding the atomic refractivities of its constituents, or by dividing the specific refractivity by the molecular weight. These are the same where no allowance must be made for unsuspected peculiarities in the molecular structure. **specific-** The refractivity of a substance calculated from its refractive index:

$$\frac{n^2 - 1}{n^2 + 2} \cdot \frac{1}{d}, \quad \text{or} \quad \frac{n^2 - 1}{n^2 + 2} v.$$

n is the refractive index, d, the density and v, the specific volume. *s. r. power.* The expression, $\frac{n - 1}{d}$, which is almost independent of temperature.



Refractometer.

refractometer. An instrument for determining the refractive index of a substance.

refractories. The plural of refractory. See tables.

refractoriness. The degree of resistance of a material to softening and melting on the application of heat. Usually this is arbitrarily obtained by direct comparison with Seger cones (q.v.). **r. under load.** The degree of resistance to deformation shown by a refractory when subjected to stress at a definite temperature or over a range of temperatures.

refractory. Any material that is slow to melt and resists the action of heat; as, brick, silicon carbide or other linings for furnaces. **r. cements.** Materials used to hold r. bricks together. (a) *straight-* such as fire clay, silica, sillimanite and magnesite which have high refractoriness (>1650°C.) but poor bonding strength. (b) *synthetic-* (1) Vitrifying at about 9000°C., as portland cement, glass, feldspar, fusible clays, which have a very good bonding strength; (2)

REFRACTORIES

Name	Temperature of failure under load in °C	Bulk density	Porosity per cent	Fusing point, °C
alundum, Al_2O_3	1550[c]	2.6	.....	1750–2000
bauxite brick, $Al_2O_3.TiO_3$	1350[a]	1.6	46–50 %	1750–2000
chrome brick, $Cr_2O_3.Al_2O_3.MgO$	1450[b]	2.8–3.2	.....	1850–2050
fire clay brick, $SiO_2.Al_2O_3$	1500[a]	1.7–2.1	20–30 %	1500–1750
magnesite brick, MgO	1550[b]	2–2.8	24–40 %	2150–2165
silica brick, SiO_2	1600[b]	2–2.2	18–43 %	1685–1800
silicon carbide, SiC	1650[c]	2.0–2.6	17–34 %	2200–2240
zirconia brick, ZrO_2	1510[a]	3.4–4	19 %	2000–2600

[a] The material *softens* under a load of 25 pounds per square inch.
[b] The material *shears* under a load of 25 pounds per square inch.
[c] The material shows *no failure* under a load of 25 lbs., per square inch.

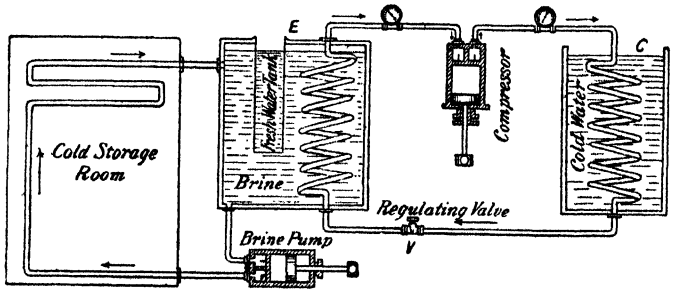
	Density	Melting point, °C
aluminum oxide	4.0	2050
chromium oxide	4.0	1990
magnesium oxide	3.2	2800
silicon oxide	2.6	1710
zirconium oxide	5.8	2950

air-setting, mixtures of refractories and fluxes of good bonding strength.

refrigerant. (1) An agent that causes a sense of cold; used medicinally. (2) An agent used to obtain a low temperature; as, a freezing mixture, *q.v.* **mechanical-** A non-corrosive liquid of suitable vapor pressure, used in refrigeration; it should be non-toxic and non-inflammable, *e.g.*

	B.P., °C	T_c, °C	P_c, atm.
Hydrogen	−252	−234	20
Air	−181	−140	39
Nitrous oxide	− 89	38.8	77.5
Carbon dioxide	− 78.2	31	73
Hydrogen sulfide	− 60	100	88.7
Ammonia	− 35	130	115
Dichlorodifluoromethane	− 30		
Sulfur dioxide	− 10	155	78.9
Butane	1		
Chloroform	61	260	54.9
Water	100	365	194

refrigeration. The production of cold, or the lowering of the temperature of a body by conducting away its heat; as in an ice machine or a series of compressors. The circuit consists of compressing a gas, cooling it and letting it expand into a low-pressure pipe system where it absorbs the heat, and is pumped out and compressed again. It is used to liquefy gases, solidify liquids, crystallize salts from solutions, regulate and control reactions, nitrations, oxidations, etc., separate impurities from gases, preserve foods and in air conditioning (see illustration).



Refrigeration
(Tower, Smith, Turton & Cope, "Physics.")

refringent. Refractive.

refuse. Waste; as garbage or sewage.

regelation. The fusion of ice under pressure, followed by the solidification of ice particles into one solid mass.

regenerate. To renew or produce again. Cf. *activation, accumulator.*

regeneration. The repair or renewal to the original state; as, of an electric battery, or a catalyst. Cf. *revivification, permutite, Weldon process.*

regenerative. Capable of being utilized anew. **r. furnace.** A furnace in which the fuel gases have been preheated by passing through channels heated by the waste gases. **r. heating.** The conservation of heat by utilizing the temperature of waste gases to heat the incoming fuel gases or air.

regenerator. A series of chambers filled with a checker work of bricks, through which the flue and fuel gases of a furnace are alternately directed.

Regnault, Henri Victor. 1810–1878. A French chemist, noted for his researches in physical and organic chemistry. **R. cell.** A voltaic cell, which consists of an anode of amalgamated zinc and a cathode of cadmium in a solution of 1 part

H_2SO_4, 1 part $CaSO_4$ and 12 parts H_2O, and which yields 0.34 volt. **R. value.** The weight of a cubic-meter of hydrogen: 89.87 grams. Cf. *krith.*

Reguir cell. An electric accumulator (1.4 volt), which consists of an anode of copper and a cathode of lead oxide in a solution of $CuSO_4$ and H_2SO_4.

regular system. The cubic system of crystal forms, q.v.

regulator. (1) Buffer solution. (2) A substance used in flotation for pH control; as, soda, lime, sulfuric acid.

regulus. (1) A small compact mass of metal obtained at the bottom of the crucible on reduction of ores. (2) A compound of one or more metals with sulfur. They are usually brittle and crystalline and have a dull greasy luster.

Reich, Ferdinand. 1799–1882. A German mining engineer noted as discoverer of indium (with Richter, 1863).

Reichenbach, Carl Freiherr von. A German chemist and industrialist noted for his theory of od-rays.

Reichert number. The number of cubic centimeters of 0.1 normal alkali required to neutralize the volatile, water-soluble acids liberated on acidification of the soap produced by saponification of ten grams of a fat. **R.-Meissl number, Reichert-Wollny number.** Similar to the R. number, referred to *five* grams fat and determined according to specified procedures. (Cf. *Polenské number.*)

Reid, E. Emmet. 1872– . American chemist noted for organic research.

Reimer's reaction. A reaction of phenols and chloroform in alkaline solutions with the formation of phenol aldehydes.

Reinecke's acid. Tetrathiocyanodiammonochromic acid. $\left[\begin{matrix}(NH_3)_2\\ Cr\\ (SCN)_4\end{matrix}\right]H$; used as a reagent in the isolation of organic bases: (e.g., proline, histidine, choline from proteins). **R. salt.** The ammonium salt, $[(NH_3)_2Cr(SCN)_4]$-NH_4H_2O, used similarly to R's. acid; also as reagent for mercury, with which it gives a red color or precipitate.

reinforced. Made stronger. **r. concrete.** A concrete with a steel foundation and structure used for buildings. **r. wine.** A wine to which alcohol has been added.

reinite. The native iron tungstate, $FeWO_4$.

Reinsch test. The detection of small quantities of arsenic by depositing it from solution as a black stain on metallic copper.

relative. Dependent upon or connected with some other phenomenon. **r. weight.** Atomic weight.

relativity. Einstein's theory. The conception that matter, space and time are relative and not absolute; that all physical phenomena are the result of conditions depending upon their position in or relation to the universe. Hence, to consider any single phenomenon or physical action in terms of its reaction or relation to other phenomena. **general-** Mass exerts an attraction on light; hence: (a) large bodies, as the sun, deflect light waves; and (b) spectral lines coming from atoms on the surface of very massive stars are shifted toward the red. **special-** Energy (E) possesses mass, hence the mass (M) of a body increases slightly when its energy content is increased. $M = E/c^2$, where c is the velocity of light which is an absolute constant of nature. Cf. *mass-energy cycle.*

relay. A sensitive electro-mechanical device which, when operated by a comparatively weak current, as from an photoelectric cell, will cause a corresponding action in a more powerful circuit.

remedy. An agent that cures or prevents disease.

remolinite. Atacamite.

Remsen, Ira. 1846–1927. An American chemist noted as teacher and writer.

Ira Remsen.

renal. Pertaining to the kidneys. **r. test.** A diagnostic test of the functions of the kidneys by administering phenolsulfonephthalein and determining colorimetrically the quantity which appears in the urine.

render. (1) To melt down; to clarify. (2) The removal of fat from animal tissues by heat.

renes. An extract from the kidneys of sheep, pigs, or calves. **r. siccii.** The dried and powdered kidneys of the sheep or pigs; used medicinally.

renin. Hypertensin. A pseudoglobulin present in fresh kidneys after intravenous injection of saline extract; soluble in water, insoluble in alcohol. It maintains a normal blood pressure. **anti-** A substance having the same origin as, but opposite in effect to r. Cf. *rennin.*

rennase. Rennin, prorennin, chymogen, caseinase, lab ferment, chymosin. An enzyme of the gastric juice from the fourth stomach of calves. It hydrolyses caseinogen, and coagulates milk with formation of curd and whey; is used in the manufacture of cheese.

rennet. A preparation of the lining of the stomach of the calf, used as a source of rennase.

rennin. Rennase. Cf. *renin.*

rensselaerite. A variety of talc.

repand. Wrinkled; as a bacterial culture with an uneven or wavy surface.

repercolation. A second or repeated percolation.

replace. To cause the substitution or exchange of an atom or group of atoms by another atom or radical.

replaceable. An atom or group of atoms that can readily be exchanged for another atom or group of atoms.

replacement. (1) The substitution of an atom or radical by another atom or radical:

$$M + HX = MX + H, \quad \text{or} \quad X + HA = HX + A.$$

(2) In mineralogy, the change from one mineral to another by gradual substitution.

repulsion. The opposite of attraction, or the tendency of two bodies to move away from each other.

resacetophenone. $C_8H_8O_3$ = 152.06. 2.4-dihydroxy acetophenone, $MeCO.C_6H_3(OH)_2$. White needles, m.147. **methyl-** Peonol.

resaldol. $C_{16}H_{14}O_5$ = 286.11. Resorcinolbenzoylcarbonicacid ethylester, 2.4-dioxybenzoyl-o-benzoicacid ethylester, $(OH)_2.C_6H_3.CO.C_6H_4.COOC_2H_5$. A yellow amorphous powder; insoluble in water, soluble in alkalis. Used medicinally as an intestinal antiseptic.

resalgin. $C_{29}H_{30}O_{12}N_4$ = 626.2. Antipyrine resorcylate, antipyreticin, $(C_{11}H_{12}O_4N_2)_2C_7H_6O_4$. A colorless, crystalline powder, m.110, soluble in water, alcohol, ether or chloroform; used medicinally as an antiseptic. **beta-** Resorcylalgin.

research. (1) The scientific investigation of a new phenomenon. (2) A literary search, followed by experimental investigation or verification.

CHEMICAL RESEARCH

World activity may be shown by: The number of chemical papers published per million inhabitants (A); *the percentage of the total number of published works* (B). *Thus for 1932:*

	A Intensity	B Quantity
Germany	125.4	26.9 %
Holland	87.0	2.09 %
Switzerland	75.2	1.06 %
Austria	73.8	1.65 %
Great Britain, Canada and Australia	71.3	13.5 %
United States	62.5	25.8 %
France	62.0	12.0 %
Sweden	61.5	1.27 %
Hungary	34.1	9.93 %
Finland	29.8	0.36 %
Denmark	25.1	0.30 %
Czechoslovakia	22.8	1.07 %
Italy	21.0	3.03 %
Japan	17.8	3.71 %
Norway	13.1	0.12 %
Latvia	11.1	0.07 %
Russia	10.4	3.4 %
Belgium	10.1	0.28 %
Poland	6.6	0.68 %
Chile	5.5	0.08 %
Argentine	4.7	0.16 %
Rumania	4.4	0.26 %
Spain	4.0	0.29 %
Brazil	0.6	0.06 %
China	0.13	0.17 %

reseda oil. Mignonette oil. A fragrant oil, used as a flavoring and scent, extracted from plants of the Reseda genus, such as mignonette.

resenes. The constituents of resins, insoluble in alkalis. They contain O; but not as OH, COOH, lactone or ester. The most valuable varnish resins (as, dammar, copal, dragon's blood) are rich in r.

reservoir. A receptacle for storage purposes.

residual. That which remains or is left. **r. affinity.** See *affinity*. **r. gas.** The small amount of gas that remains at low pressure in an evacuated apparatus, *e.g.*, a vacuum tube.

residue. The remainder; those portions that are left. *E.g.*, the ash after an ignition, or the insoluble part after filtration. **spray-** See *spray*.

resilience. The property of returning to its former shape after a body has been distorted within its elastic limits. It is measured by the work done per unit volume in distorting a body to the elastic limit, or in producing rupture.

resilient. Elastic, or rebounding.

resin. A class of inflammable, amorphous, vegetable products of secretion or disintegration, usually formed in special cavities of plants. Generally insoluble in water and soluble in alcohol, fusible and having a conchoidal fracture. They are the oxidation or polymerization products of the terpenes, and consist of mixtures of aromatic acids and esters which are insoluble in water, soluble in alcohol, ether or essential oils. The official (U.S.P.) resins are: *benzoin, guaiac, mastic* and *resin;* other (non-official) resins are *copal, dammar, dragon's blood, elaterium, lac, sandarac.* (Cf. *plastics, resin, resinoid, balsam, gum.*) **alkyd-** R. made from phthalic anhydride and glycerol. **artificial-** See *plastics*. **gum-** R. containing gum, capable of softening in water. **oil reactive-** A synthetic phenol-formaldehyde product which dissolves in oil, reacts with it and forms a quick hardening varnish. **oil soluble-** R. not reacting with an oil but soluble in it. **oleo-** Balsams. A viscous or semi-liquid mixture of r. with essential oils. **synthetic-** See *plastics, resinification*. **vinyl-** A synthetic polymerization product of vinyl compounds, Cf. *vinylite*.

NATURAL RESINS AND BALSAMS

1. true resins

Coniferae:	
Abies, Picea, Pinus, etc. species	colophony
Agathis dammara	Manila copal
Agathis australis	kauri
Callitris species	sandarac
Leguminosae:	
Hymenaea species	Brazilian copal
Trachylobium species	copal
Burseraceae:	
Protium species	dammar
Canarium strictum	black dammar
Canarium commune	Manila elemi
Dipterocarpaceae:	
Shorea species	sal dammar
Anacardiaceae:	
Pistacia lentiscus	mastic
Rhus vernicifera	Japan lacquer
Liliaceae:	
Dracaena draco	dragon's blood
Xanthorrhoea hastilis	black boy
Zygophyllaceae:	
Guaiacum officinale	guaiacum
Convulvulaceae:	
Exogonium purga	jalap
Moraceae:	
Ficus species	shellac

2. gum-resins

Burseraceae:	
Boswellia carteri	olibanum
Commiphora myrrha	myrrh
Commiphora mukul	bdellum

Guttiferae:	
Caulophyllum tacamahaca...	tacamahac
Garcinia hanburii.....	gamboge
Umbelliferae:	
Dorema ammoniacum.....	ammoniacum
Ferula asafetida.....	asafoetida
Ferula galbaniflua.....	galbanum
Convulvulaceae:	
Convulvulus scammonia.....	scammony
Anacardiaceae:	
Mangifera indica.....	mango gum
S. oleo-resins or balsams	
Coniferae:	
Abies, Pinus, etc. species...	crude turpentine, Canada balsam, pitch, etc.
Leguminosae:	
Copaiferae species.....	copaiva balsam
Myroxylon pereira.....	Peru balsam
Myroxylon toluifera.....	tolu balsam
Burseraceae:	
Commiphora opobalsamum..	balm of Gilead
Hamamelidaceae.	
Liquidambar orientalis.....	Levant storax
Liquidambar styraciflua.....	American storax
Styraceae:	
Styrax officinale.....	storax resin
Styrax benzoin.....	benzoin
Other families:	
Dipterocarpus species.....	gurjun
Melanorrhoea usitata.....	theetsee
Opopanax species.....	opopanax
Populus balsamifera.....	tacamahac
Vateria indica.....	white dammar

r. acids. A group of organic acids derived from resins; as, pimaric, sapinic, colophonic and sylvic acids. **r. of copper.** An obsolete term for cuprous chloride.

resina. (1) Latin for resin. (2) Rosin.

resinamines. Insoluble, amorphous, solid bases from low-temperature, tar, which have the properties of resins in that they fuse to glassy masses and are deposited from solution as tough films.

resinate. Any salt of a resin acid mixture.

resinene. A generic name for neutral resins.

resineon. An essential oil, distilled from black tar oil, b.148; used medicinally as an antiseptic.

resinification. (1) The process of oxidation or polymerization of essential oils by which they become solid and form resins. (2) The artificial condensation of phenol with formaldehyde, or similar processes, by which resin-like substances are formed. Cf. *plastics.*

resinoic acid. The generic name for acidic resins.

resinoid. A substance that resembles a resin in its physical properties, but differs by having a heat-hardening character, *i.e.*, changing from a soluble and fusible solid to an insoluble and infusible solid on heating. Cf. *plastics.*

resinol. (1) In resole. (2) The non-crystalline constituents of tar, which are soluble in sodium hydroxide solution and can be precipitated from a solution in an organic solvent by addition of light petroleum. Cf. *resinotannol.*

resinotannol. A colored alcohol of resin esters which gives the tannin reaction. Cf. *resinol.*

resinous. Having resin-like properties.

resistance. (1) Opposition to force or external conditions. (2) The reciprocal of conductance, measured in ohms; the opposition that a conductor offers to the passage of an electric current (see *ohm, mho*). **body-** See *immunity.* **external-** The opposition to the passage of an electric current outside the source of current; as in wires, lamps, rheostats, or moving machinery. **internal-** Electrical resistance within the generating device. **specific-** See *specific resistance.*

Approximate electrical resistance of metals, compared with Cu = 1.0

chromel A	47.8
constantan	26.6
German silver	18.0
lead	12.8
tin	8.28
nickel	7.78
iron	5.70
platinum	5.65
zinc	3.62
aluminum	1.61
gold	1.38
copper	1.00
silver	0.92

r. box. An arrangement of rheostat coils in rows, mounted in a compact container. By the insertion of plugs any degrees of resistance may be obtained. **r. capacity.** The cell-constant, K, obtained from the ratio of the measured conductivity of a solution in the cell, K_2, to its known specific conductivity, K_1, hence: $K = K_1/K_2$. It is the factor for correcting the observed conductivity for peculiarities in the shape of the cell. **r. coil.** A spool of wire for increasing the r. in a circuit. **r. gage.** See *gage.* **r. to infection.** See *immunity.* **r. wire.** A nichrome wire for heating units, or r. devices having a definite r.:

Wire gage	Feet per pound	Ohm per foot
2	5	.005
6	12.5	.013
8	20	.020
11	40	.041
14	80	.083
18	200	.212
22	500	.531

r. thermometer. See *pyrometer.*

resistivity. The specific resistance, $\rho = Ra/l$, where R is the resistance, a the cross section and l the length of the material.

resistor. A metal (as chromium or manganese) which becomes hot on the passage of an electric current; used in electrical heating devices or rheostats, q.v. **age-** A substance which when added to rubber inhibits its oxidation; *e.g.*, aromatic diamine antioxidants.

resocyanin. $C_{10}H_8O_3$ = 176.1. 4-oxy-β-methylcoumarin, β-methylumbelliferone. A colorless crystalline powder, m.185; used in perfumery.

resoflavin. $C_{14}H_8O_4(OH)_2$ = 286.05. A yellow dye derived from resorcinol.

resole. A compound formed by the condensation of a phenol with an aldehyde in presence of a catalyst and alkali; they are hardened by heat. Cf. *bakelite, novolak.*

resolution. (1) Mesotomy. The cleavage or separation of a racemic mixture into its optically-active components. Cf. *racemization, inversion.* (2) The separation of spectral lines into a number of component lines by intense electric or magnetic fields; Cf. *Stark effect.*

resolving power. The power of a lens to produce a detailed and distinct image of an object at certain distances.

resonance. (1) The vibrations set up by sound or electromagnetic waves in a material which is capable of vibrating with the same or a multiple frequency. Cf. *luminescence, fluorescence.* (2) Describing an atom which emits rays of the same wave length as it has previously absorbed. (3) Mesomerism. The phenomenon which occurs when an atom takes up a spatial position intermediate between two other theoretically-possible positions.

resonant. Producing sound.

resonator. (1) An instrument used to intensify sound waves or electro-magnetic oscillations by resonance in a suitable material. (Cf. *quartz oscillator.*) (2) A chromophoric or fluorophoric constellation (q.v.) of electrons which absorbs rays of certain wavelengths; hence, the electronic arrangement of a chromophore or fluorophore.

resopal. A synthetic resin used for switches and illumination accessories.

resopyrine. A derivative of resorcinol and antipyrine. Minute rhombic crystals, insoluble in water; used medicinally.

resorcin. Resorcinol. **r. blue.** A microchemical stain.

resorcinol. $C_6H_6O_2$ = 110.1. Resorcin, *1.2*-benzenediol,* metadihydroxybenzene, $C_6H_4(OH)_2$. A diatomic phenol, colorless tablets, d.1.282, m.116, b.276; very soluble in water, alcohol, or ether. Used as a reagent for many organic compounds, as a reducing agent, in the manufacture of fluorescein, eosin, and many other dyes, synthetic drugs, and photographic developers; medicinally, as an external dehydrant, antiseptic, antiferment, and bactericide. **acetamido-** Dihydroxy-acetanilide. **dimethoxy-** $C_6H_4(OMe)_2$ = 138.1. A colorless liquid, d.-1.080, b.214, slightly soluble in water, soluble in alcohol or ether; used in organic synthesis. **dimethyl-** Xylorcinol. **dithio-** *1.3*-Phenylene mercaptan. **hexahydro-** *1.3*-Cyclohexanediol. **hexyl-** Hexylresorcinol. **methyl-** Orcinol. ***p*-nitrobenzeneazo-** $(HO)_2C_6H_3N{:}N.C_6H_4NO_2$. A sensitive reagent for Mg, 0.1 mg. of which in 5 cc. gives a blue color. **propyl-** Divarinol. **trimethyl-** Mesorcinol. **trinitro-** Styphnic acid. **r. carbolate.** Phenoresorcin. **r. monoacetate.** Euresol. **r. phenate.** Phenoresorcin. **r. phthalein.** See *fluorescein.* **r. yellow.** Tropeolin.

resorcitol. *1.3*-Quinitol.

resorcyl. The monovalent radical of resorcinol, $-C_6H_4.OH$ (1.3-hydroxybenzene).

resorcylalgin. Beta-resalgin, antipyrine resorcylate. An isomer of resalgin, m.115; soluble in water, alcohol, or ether.

resorcylate. A salt of one of the resorcylic acids.

resorcylic acid. $C_7H_6O_4$ = 154.1. Resorcinol carboxylic acid, dihydroxybenzoic acid, $C_6H_3(OH)_2COOH$. A group of triatomic, monobasic acids in which the two OH groups are in the *meta-* position; thus:

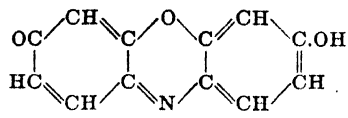
α- or 3.5-dihydroxybenzoic acid, q.v.
β- or 2.4-dihydroxybenzoic acid, q.v.
γ- or 2.6-dihydroxybenzoic acid, q.v.

propyl- Divaric acid.

resorption. The absorption of excreted material, including the products of inflammation.

resorpyrine. Resopyrine.

resorufin. $C_{12}H_7O_3N$ = 213.1. Oxyphenazone, oxyphenoxazone. The heterocyclic compound:



Used to detect halogens, as its intense fluorescence in alkaline solution is destroyed by Cl or Br.

respiration. The process of breathing, by which air is inhaled (inspiration) and expelled (expiration) from a living organism. In mammals respiration depends on the chemical equilibrium between the hemoglobin, (*HG*), oxygen, carbon dioxide, and sodium bicarbonate, as a result of which: (1) in the lungs (where an excess of oxygen exists) the hemoglobin is transformed to oxyhemoglobin; and (2) in the tissues (where an excess of carbon dioxide exists) the oxyhemoglobin releases the oxygen and removes the carbon dioxide:

$$\begin{array}{ccc} NaHCO_3 + O_2 + & & CO_2 + O_2 + H_2O + \\ & \overset{(2)}{\rightleftharpoons} & \\ HG\text{—}COOH & \overset{(1)}{\rightleftharpoons} & HG\text{—}COONa \\ (2)\ \uparrow\downarrow\ (1) & & (2)\ \downarrow\uparrow\ (1) \\ & \overset{(2)}{\rightleftharpoons} & \\ O_2.HG.COOH & \overset{(1)}{\rightleftharpoons} & O_2.HG.COONa \\ + NaHCO_3 & & + CO_2 + H_2O \end{array}$$

The sodium bicarbonate in blood acts as a buffer.

respirator. Inspirator, inhalor. A gas-mask or screen of fine wire or gauze with or without adsorbing or chemical reagents, worn over the mouth or nose to protect the wearer from dust, smoke, poisonous or irritating gases. **automatic-** A gas mask.

respiratory. Pertaining to respiration. **r. metal.** The metals Fe, Mn, Cu Zn and Mg, which are constituents of chromoproteins. See *pigment.* **r. quotient.** The ratio of the volumes of inhaled oxygen to expelled carbon dioxide, $(O_2)/(CO_2)$.

restitution. The reverse reaction of substitution *i.e.*, the restoration of the original compounds. An element is either oxidized or reduced to the free state in this process (cf. *substitution*).

restorative. An agent that aids in renewing or promoting a healthy physical condition.

resublimed. Purified by repeated sublimation.

resultants. The products of a chemical reaction; reaction-products. Cf. *reactants.*

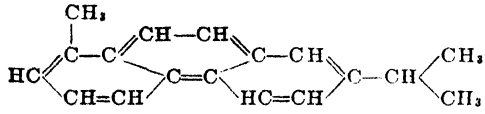
resuscitation. The restoration of consciousness or life in one apparently dead from asphyxiation or suffocation. **r. gas.** A mixture of approx. 93 % O_2 and 7 % CO_2, used for artificial respiration.

retamine. $C_{15}H_{26}ON_2$ = 250.2. An alkaloid from the young shoots of *Retama sphaerocarpa;* long needles, m.162, insoluble in water.

retardation. A slowing-up of a chemical reaction; a negative catalysis.

retarder. A substance added to a reacting mixture to prevent the reaction from becoming too vigorous; as the addition of potassium bromide to photographic developers to prevent over-development. Cf. *accelerator, promoter, catalytic poison.*

retene. $C_{18}H_{18}$ = 234.23. Methylisopropylphenanthrene. A hydrocarbon from pine tar. Lustrous leaflets, d.1.13, m.98, b.390, slightly soluble in water, soluble in alcohol or ether.



retention. The holding or retaining of a substance or property.

retentivity. The holding-back or retardation of a property.

Retger's law. The physical properties of mixed crystals vary in proportion with their percentage composition.

reticulated. Retiform. Resembling network.

reticulin. The protein of the fibers of reticular tissue not digested by pepsin or trypsin; it does not yield gelatin on boiling.

retiform. Reticulated.

retina. The portion of the eye on which the image is focussed by the lens. It consists of a number of bundles of sensitive rods and cones, which carry the sensation to the brain.

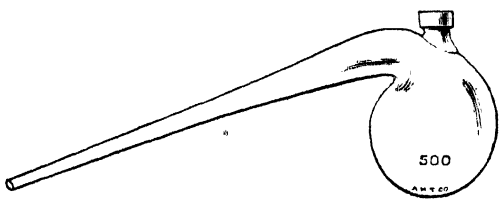
retinene. A yellow protein pigment formed in the eye retina by the action of light on rhodopsin (q.v.). It subsequently forms vitamin A, which in turn forms more rhodopsin.

retinite. The amorphous grey native substance, $C_{12}H_{18}O$. **r. resins.** A group of hard, brittle, light-brown resins from brown coal. They contain no wax (cf. *bituminous resins*), and are derived from amber.

retinol. $C_{32}H_{16} = 400.1$. Resinol, codol, resinoil. A liquid hydrocarbon obtained by distilling pitch or rosin. A yellow liquid, b.280, insoluble in water, soluble in alcohol; used medicinally as an antiseptic.

retonation. A wave propagated backwards through the burned gases from the starting point of an explosion.

retort. A distilling vessel of glass, iron, or other material. Originally a flask with a bent neck (alembic).



Retort.

retro- A prefix derived from the Latin, indicating *backward*.

retrogression. A reversal, or the reverse reaction.

retronecine. $C_8H_{13}NO_2 = 155.1$. A basic hydrolysis product of retrorsine.

retronecinic acid. $C_{10}H_{16}O_6 = 232.12$. An acid hydrolysis-product of retrorsine.

retrorsine. $C_{18}H_{25}NO_6 = 351.2$. An alkaloid from *Senecio retrorsus*, a Compositae.

retting. Loosening the fibre of vegetable materials by the action of moisture and enzymes or bacteria. Compare *coir*, *flax*.

retzbanyite. Native lead bismuth sulfide.

reussinite. A resin-like, reddish-brown hydrocarbon in certain coal deposits.

reverberatory. Flickering or blowing downwards. **r. furnace.** An oven in which the flames, but not the fuel, come into contact with the material to be heated, by reflection from a sloping roof. Cf. *furnace*.

reversible. Pertaining to restoration of the original condition; retracing or reversing. **r. action.** The re-establishment of an original condition. **r. cell.** An accumulator or an electric cell which after discharge of its current, can be restored to an active state by the application of an external current. **r. colloid.** See *colloid*. **r. electrode.** An electrode which owes its potential to ionic changes of a reversible nature. (See *electrode*.) **r. reaction.** A reaction that establishes an equilibrium, or which can be made to proceed from right to left or from left to right: $A + B \rightleftharpoons C + D$.

revert. To change back; *e.g.*, from a more soluble to a less soluble form, as the H_3PO_4 of superphosphate.

revertose. $C_{12}H_{22}O_{11} = 342.2$. A disaccharide produced by the action of maltase on glucose solution.

revive. (1) To restore the original activity; *e.g.*, of a catalyst. (2) To reduce a metallic ore or oxide to the metal.

revivification. The restoration of the active condition. **r. of carbon.** The reactivation of carbon by: (a) burning in the absence of air; (b) washing with acids to remove its ash; (c) washing with an alkaline solution.

Rey, Jean. 1630. An alchemist who carried out experiments on metallic oxides.

Reynold's number. An expression of fluid flow in a pipe, viz: (velocity of flow × diameter of pipe)/coefficient of kinematic viscosity of the liquid.

RG acid. *1*-Naphthol-*3.6*-disulfonic acid.

rH or r_H. (1) The symbol for oxido-reduction potential, $r_H = \log \frac{1}{p_{H^2}}$, where p_{H^2} is the hydrogen pressure in atmospheres, cf. p_H. (2) rH factor. A factor present in certain human blood erythrocytes, which enables them to act as antigens when injected into certain animals and to stimulate the production of immune antibodies in man. It is of importance in selecting blood for transfusion.

Rh. The symbol for rhodium.

rhabdophane. Phosphocerite. The mineral (Ce, Di,La)$_3$(PO$_4$)$_2$.

Rhamnaceae. Buckthorn family, a group of shrubs or small trees from which the following drugs are derived:

Rhamnus cathartica	buckthorn
Rhamnus frangula	frangula
Rhamnus purshiana	cascara sagrada
Ceanothus americanus	New Jersey tea
Gouania domingensis	chewstick

Cf. *colletin*, *cathartin*.

rhamnase. An enzyme from fungi that hydrolyses rhamnose.

rhamnegin. $C_{12}H_{10}O_5 = 234.1$. A glucoside from buckthorn berries.

rhamnetin. $C_{16}H_{12}O_7 = 316.1$. A methyl ester of quercetin and a split-product of xanthorhamnin; used as a yellow coloring material.

rhamnicogenol. A pentahydroxymethylanthranol occurring as primeveroside in purgative buckthorn and other *Rhamnus* species.

rhamnicoside. $C_{26}H_{30}O_{15}.4H_2O = 652.3$. A glucoside from the stem bark of purgative buckthorn, *Rhamnus cathartica*, a Rhamnaceae. Cf. *Chinese green*.

rhamnin. A fluid extract of *Rhamnus frangula* containing rhamnetin. **xantho-** Xanthorhamnin.

rhamninose. $C_{18}H_{32}O_{14}$ = 470.25. A trisaccharide from Persian berry, *Rhamnus infectoria*, which hydrolyses to two rhamnose and one glucose residue, $[\alpha]_D$ − 41°.

rhamnite. Rhamnitol.

rhamnitol. $C_6H_{14}O_5$ = 166.14. A methylpentite, $Me(CHOH)_4—CH_2OH$, obtained by reduction of rhamnose. Colorless crystals, m.121, soluble in water or alcohol.

rhamnofluorin. A constituent of *Rhamnus* species.

rhamnogalactoside. A series of glucosides that are hydrolysed to rhamnose and galactose; as, robinin and xanthorhamnin.

rhamnoglucoside. A glucoside that is hydrolysed to rhamnose and glucose; as, hesperidin, rutin, and sophorin.

rhamnol. $C_{20}H_{36}O$ = 292.3. An alcohol, m.132, from cascara sagrada.

rhamnomannoside. A glucoside that is hydrolysed to rhamnose and mannose; as, baptisin, frangulin, and strophanthin.

rhamnose. $C_6H_{12}O_5.H_2O$ = 182.1. A methylpentose from rhamninose and various glucosides. $Me(CHOH)_4CHO.H_2O$, isodulcite. Colorless crystals, d.1.471, m.92, soluble in water, slightly soluble in alcohol or ether. It is formed by hydrolysis of glucosides. Cf. *quinovose*.

rhamnoside. (1) A glucoside that is hydrolysed to rhamnose. (2) $C_{21}H_{20}O_9$. A split-product of the glucoside, rhamnoxanthin, which occurs in the rhamnus species.

rhamnosterin. $C_{18}H_{28}O_2$ = 276.3. A constituent of *Rhamnus* species.

rhamnoxanthin. A crystallizable glucoside from *Rhamnus frangula*.

Rhamnus. A genus of trees and shrubs; many have a purgative bark or fruit. **R. cathartica.** Buckthorn berries. The dried fruits of *Rhamnus cathartica*. **R. frangula.** See *frangula*. **R. purshiana.** See *Cascara sagrada*.

rhatanin. $C_{40}H_{43}O_3N$ = 585.4. Angelin, geoffrayin, andirin. A glucoside of rhatany root and other drugs; crystalline needles, m.280.

rhatany. Krameria.

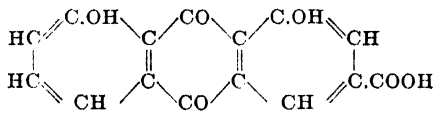
rhe. The absolute unit of fluidity. It is the reciprocal of the unit of viscosity, or centipoise.

rhea fiber. Ramie.

rheadine. $C_{21}H_{21}O_6N$ = 383.18. An alkaloid from opium; small white prisms, m.246.

rheic acid. $C_{20}H_{16}O_9$ = 400.1. An amorphous red powder. Cf. *chrysophanic acid*.

rhein. $C_{15}H_8O_6$ = 284.1. Rheinic acid. *1,9*-Dihydroxyanthraquinone-*3*-carboxylic acid. A monobasic diketonic acid obtained from senna leaves, rhubarb and lichens; golden-yellow prisms, m.162.



rheinic acid. Rhein.

rhenate. A compound of the type M_2ReO_4. **per-** A compound of the type $MReO_4$. They are all colorless, soluble in water (except Ag, Tl, K, Rb and Ce).

rhenic acid. The dibasic unstable acid H_2ReO_4 which changes to $HReO_4$. **per-** The acid $HReO_4$ formed on dissolving R_2O_7 in water.

rhenium. Re = 186.31. Dvi-manganese. The element of atomic number 75, a noble metal of the platinum group discovered by Noddack in 1924, by means of its x-ray spectrum, in platinum ores, gadolinite and columbite. It is probably identical with uralium. Used as a catalyst to dehydrogenate alcohols to aldehydes or ketones at 450–550°C. It has two isotopes, mass 185 and 187, and valencies of 7, 6, 4, and 3, d. 21.0, m.3440 ± 60°A; soluble in nitric acid, slowly in sulfuric acid, insoluble in HCl and HF. **r. chloride.** (1) $ReCl_7$ = 434.8. R. heptachloride. Green volatile crystals which are hydrolyzed in water. (2) $ReCl_6$ = 399.3. R. hexachloride. Brown volatile crystals. (3) $ReCl_4$ = 328.3. R. tetrachloride. Brownish-crystals. (4) $ReCl_3$ = 292.68. Hexagonal, dark red crystals, soluble in water. **r. fluoride.** ReF_6 = 300.31. Pale yellow-green crystals, m.25.6. **r. oxides:** (1) Re_2O_8. R. peroxide. A bluish-white solid, soluble in water and acids. (2) Re_2O_7. R. heptaoxide. A yellow solid, m.200, b.450, soluble in water forming perrhenic acid. (3) ReO_3. Red solid which changes to Re_2O_7. (4) ReO_2. R. dioxide. A black powder formed by heating $NaReO_4$ in hydrogen. (5) Re_2O_8. A blue solid. **r. sulfide.** Re_2S_7.-H_2O. R. heptasulfide. A black powder, insoluble in acids or alkalis but oxidized by HNO_3.

rheochrysin. $C_{22}H_{22}O_{10}$ = 446.2. A glucoside from rhubarb. Cf. *rheopurgin*.

rheoid. The combined principles from the root of *Rheum officinale*, rhubarb; used medicinally as a tonic and alterative.

rheology. The science of the deformation and flow of matter, *e.g.*, elastic, viscous and plastic. Cf. *softener*.

rheometer. (1) A galvanometer. (2) An instrument for measuring the velocity of the blood current.

rheopexy. A form of thixotropy (q.v.), in which solidification occurs as the result of a regular gentle motion instead of vigorous shaking.

rheopurgin. A constituent of rhubarb which decomposes into 4 glucosides (cf. *rheochrysin*, *rhein*).

rheoscope. An instrument for detecting an electric current.

rheostan. The alloy Cu(52), Zn(18), Ni(25), Fe(5). It is used for rheostats.

rheostat. An instrument for regulating the resistance of an electric current. Cf. *resistance box*.

rheotannic acid. $C_{28}H_{26}O_{14}$ = 562.2. Rhubarb tannin. A yellow powder, soluble in water.

rheotome. A current breaker.

rheum. Rhubarb.

rhigolene. The first condensation-product of the fractional distillation of petroleum, b.21, which consists largely of butane and pentane. Used in atomizers to produce coldness of the skin before surgical operations; also as a solvent.

rhinanthin. A glucoside obtained from the seeds of *Alectorolophus hirsutus* or *Rhinanthus major*, Scrophulariaceae.

rhinemetal. An alloy of 97 % tin and 3 % copper, d.7.35, m.300.

rhinestone. A colorless, highly-refractive glass cut as a brilliant and used as a semi-gem.

rhizocholic acid. An oxidation-product of cholic acid.

rhizoid. Describing a bacterial growth of an irregularly-branched or root-like character.

rhizome. An underground plant stem that partly performs the functions of a root, and is characterized by the presence of leaf bases. The following rhizomes are official and used medicinally:

Arnica	Hydrastris
Aspidium	Leptandra
Calamus	Menispermum
Caulophyllum	Podophyllum
Cimicifuga	Sanguinaria
Convallaria	Serpentaria
Cypripedium	Spigelia
Geranium	Triticum
Ginger	Valerian
	Veratrum viride

rhizonic acid. $C_{10}H_{12}O_4$ = 208.1. *6*-Hydroxy-*4*-methoxy-isoxylic acid. White crystals, m.232. **iso-***4*-Hydroxy-*6*-methoxy-isoxylic acid. White crystals, decomp. 156, soluble in alcohol or ether, decomp. by boiling water.

rhizosphere. The soil in the immediate neighborhood of a growing root system.

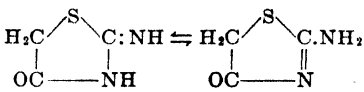
rho. The Greek letter, *ρ* or P. **r. 1.** Theelin. **r. 2.** Progesterone.

rhodacene. $C_{30}H_{20}$ = 380.2. A pyrolytic product from acenaphthene. A dark violet crystal mass with greenish metallic luster, m.339, isomeric with chalcacene, into which it changes on strong illumination in dilute solution.

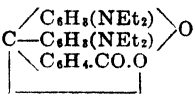
rhodalline. Allyl sulfocarbamide.

rhodamic acid. Rhodanine.

rhodamine. (1) $C_3H_4ON_2S$ = 116.1. Rhodamic acid, 4-keto-2-thiothiazolidine. The heterocyclic compound,



(2) A group of red dyes closely allied to the fluoresceins, obtained by condensation of phthalic anhydride with *p*-alkylated aminophenols. **tetraethyl-** $C_{28}H_{30}N_2O_3$ = 442.2.



It is colorless, but its salts are red dyes with an oxonium or quinoid structure.

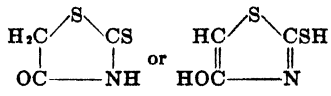
rhodan. The monovalent radical, —SCN. (See *thiocyanate.*)

rhodanate. Thiocyanate.

rhodanic acid. (1) Rhodanine. (2) Thiocyanic acid.

rhodanide. Thiocyanate.

rhodanine. $C_3H_3ONS_2$ = 133.1. Rhodanic acid, 4-keto-2-thio-m-thiazolidine.



***p*-dimethylaminobenzilidene-** $(C_3HNOS_2):CH.C_6H_4.NMe_2$. A sensitive reagent for silver, with which it gives a flocculent red precipitate.

rhodanizing. Plating with rhodium (especially on silverware) to prevent tarnishing.

rhodanometry. (1) The use of free cyanogen to determine the absorption values of oils; the cyanogen behaves analogously to iodine. (Cf. *iodine number.*) (2) Thiocyanometry. Titration with thiocyanate solutions to determine silver, mercury, etc.

Rhode test. A color reaction for proteins. Concentrated H_2SO_4 and dimethyl aminobenzaldehyde give a purple color.

rhodeite. Rhodeol.

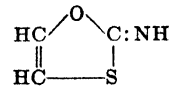
rhodeol. $C_6H_{14}O_5$ = 166.1. Rhodeite, rhodeitol. A pentatomic alcohol, $CH_3(CHOH)_4CH_2OH$, that is oxidised to rhodeose.

rhodeoretin. Convolvulin.

rhodeose. $C_6H_{12}O_5$ = 164.1. A methylpentose glucoside and isomer of fucose in jalap roots.

rhodiene. $(C_{10}H_{16})_x$. A hydrocarbon from *Rhodium lignum*, rose wood.

rhodime. C_3H_3ONS = 101.1. 2-thiozolimine. The heterocyclic compound,



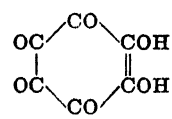
rhodinol. $C_{10}H_{19}OH$ = 156.2. 2.6-dimethyl-octene-2-ol-8. An unsaturated alcohol, $Me_2C:CH.CH_2.CH_2.CHMe.CH_2.CH_2OH$, a constituent of citronella and geranium oils; used in artificial or synthetic oil of rose.

rhodite. Rhodium gold.

rhodium. Rh = 102.91. A metal of the platinum group, atomic number 45. It is a grayish-white ductile metal, d.12.44, m.1920, insoluble in water or acids; it occurs in the platinum ores and gold gravels of South America. It was discovered by Wollaston (1804), and its usual valency is three. Used for plating it has a permanent brilliant silver-like polish, which is superior to chromium-plating. Used in alloys, in the manufacture of thermo-elements and astronomical measuring instruments; also for plating jewelry and silverware. **r. black.** Finely-divided r. metal obtained by precipitation of rhodium salt solutions by formaldehyde; used as a catalyst. **r. cesium alum.** $Rh_2(SO_4)_3,Cs_2(SO_4),24H_2O$ = 128.10. Yellow octagonal crystals, m.110, and soluble in water. **r. chloride.** $RhCl_3.4H_2O$ = 281.34. R. sesquichloride. A brownish-red, deliquescent powder, decomp. 475; slightly soluble in water. **r. gold.** Rhodite. A native alloy which contains 57–66 % gold and 34–43 % rhodium. **r. hydroxide.** $Rh(OH)_3$ = 153.92. A black amorphous powder, decomp. by heat, insoluble in water or alcohol, soluble in alkalis. **r. nitrate.** $Rh(NO_3)_3.2H_2O$ = 325.0. A red, crystalline deliquescent powder; soluble in water, insoluble in alcohol. **r. oxides:** (1) RhO = 118.9. R. monoxide. A gray powder; insoluble in water, alcohol or ether. (2) Rh_2O_3 = 253.8. R. sesquioxide. A gray amorphous powder obtained by heating r. with barium peroxide; insoluble in water or alcohol. (3) RhO_2 = 134.9. R. dioxide. A brown powder; insoluble in water or alcohol. **r. sulfate.** $Rh_2(SO_4)_3.12H_2O$ = 710.2. A light yellow, crystalline powder; soluble in water. **r. sulfide.** RhS = 135.0. A bluish, amorphous powder, decomp. by heat; insoluble in water or alcohol.

rhodizite. A white or green native calcium borate.

rhodizonic acid. $C_6H_2O_6$ = 170.1. A dihydroxy-diquinone that acts as a dibasic acid.



Its sodium salt is used as spot-test reagent for Ba and Sr (reddish-brown).

rhodochrosite. $MnCO_3$. Red manganese. A native manganese carbonate.

rhododendrin. $C_{16}H_{22}O_7$ = 326.2. A constituent of *Rhododendron chrysanthemum*, an Ericaceae.

Colorless crystals, m.187; soluble in hot water or alcohol.

rhododendrol. $C_{10}H_{12}O_2$ = 164.1. A constituent of *Rhododendron chrysanthemum*. Colorless crystals, m.80.

rhodol. Metol.

rhodolite. A variety of garnet.

rhodonite. $MnSiO_3$. Red manganese, manganese spar. A native manganese silicate.

rhodopterin. A purple oxidation-product of pterin (q.v.).

rhodopsin. The protein pigment of the visual purple (q.v.) in the retina of the eye. Cf. *retinene*.

rhodopurpurin. Rhodovibrene.

rhodotannic acid. $C_{14}H_8O_7$ = 286.1. A tannin derived from the leaves of *Rhododendron ferrugineum*.

rhodovibrene. Rhodopurpurin. A purple carotenoid pigment produced by bacteria.

rhodoviolascene. $C_{42}H_{60}O_2$(?). A carotenoid pigment derived from purple bacteria.

rhodoxanthin. $C_{40}H_{50}O_2$ = 562.35. Thujorhodin. A carotenoid (q.v.) and red isomer of xanthophyll in the red berries of *Taxus baccata* (yew), the leaves of the Russian pond weed, *Potomogeton patans*, and of arbor vitae, *Thuja orientalis*.

rhoduline. A group of aniline dyes of the safranine type; used in textile printing.

Rhoeadales. An order of plants comprising the families: *Papaveraceae*, *Cruciferae*, *Resedaceae*.

rhoeadic acid. Papaveric acid.

rhoeadine. $C_{21}H_{21}O_6N$ = 383.2. A crystalline alkaloid obtained from *Papaver rhoeas*, a Papaveraceae.

rhoeagenine. An isomer of rhoeadine.

rhoetzite. Kyanite.

rhomb. Rhombic. **r. spar.** A rhombic form of dolomite.

rhombic. A crystal with three unequal axes all at right angles; as, iodine, sulfur, or copper sulfate. (See *crystal systems*.) **r. dodecahedron.** A crystal of the isometric system which has twelve faces; each face parallel to one axis and having equal intercepts on the other two neighboring faces. **r. mica.** Phlogopite. **r. quartz.** An obsolete term for feldspar. **r. spar.** A form of dolomite. **r. system.** In crystallography, the orthorhombic system.

rhombohedral. A crystal of the trigonal system having a vertical axis of threefold symmetry and three horizontal axes of twofold symmetry. **r. system.** A modified trigonal system of crystals which have three horizontal axes of twofold symmetry in place of the threefold symmetry of the hexagonal system. Cf. *crystal systems*.

rhombohedron. A crystal form bounded by six faces of rhombic outline.

rhotanium. An alloy of palladium and rhodium.

rhubarb. Rheum. The dried rhizomes and roots of *Rheum officinale*, and other Rheum species of the family Polygonaceae. It contains rheopurgin, chrysophanic acid, rhein, tannic acid, and other principles; used medicinally as a laxative and gastric tonic, and as the fluid extract, syrup, tincture, powder, and tablets. Cf. *aporhetin*, *erythroretin*, *pheoretin*. **r. tannin.** A rheotannic acid.

Rhus. A genus of trees and shrubs of the Anacardiaceae, cashew family. *R. aromatica*. The bark of a shrub of North America. Used as the fluid extract, as a tonic and stimulant. *R. coriaria*. Sumac. *R. cotinus*. Fustic. *R. diversiloba*. The poison oak of the Pacific Coast. *R. glabra*. Sumac berries. The dried ripe fruit of *R. glabra*; used as the fluid extract, as an astringent. *R. toxicodendron*. The poison oak of the Atlantic States, or poison ivy.

rhusin. Rhusoid. The combined powdered principles from *Rhus glabra*, used medicinally.

rhusoid. Rhusin.

rhythm. Occurrence at regular intervals, as a sound, or wave-motion.

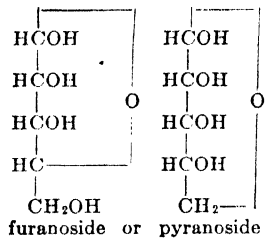
rhythmic. Occurring at regular intervals. **r. deposition.** Precipitation or condensation in gas or vapor mixtures at periodic intervals, such as are produced when two vials of HCl and NH_4OH are placed in a closed bell jar. **r. precipitation.** Periodic precipitation. Precipitation in bands or zones in a colloid, as in Liesegang's rings, q.v.

ribichloric acid. $C_{14}H_8O_9$ = 320.1. An acid constituent from *Galium aparine*, goosegrass, a Rubiaceae.

riboflavin. See *lactoflavin*.

ribonic acid. $C_5H_{10}O_6$ = 166.1. A pentabasic acid, $CH_2OH(CHOH)_3COOH$, derived from ribose.

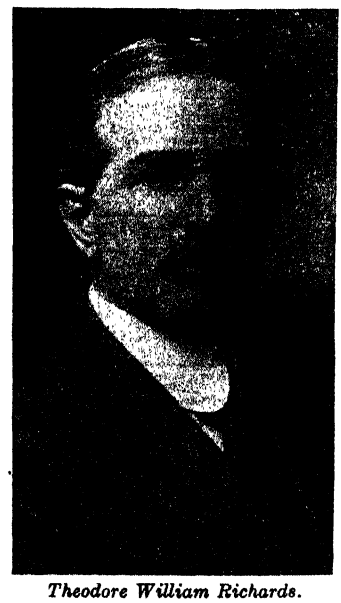
ribose. $C_5H_{10}O_5$ = 150.1. A pentose sugar constituent of some nucleic acids, $CH_2OH(CHOH)_3CHO$. It may exist as:



furanoside or pyranoside

r. ketohose- Allulose.

rice. The seeds or grains of *Oryza sativa* which contain mainly starch (rice flour). Used as a food, and finely-powdered as a dusting powder.



Theodore William Richards.

rich. High in content or of great percentage. **r. gas.** The second group of combustible gases obtained by the distillation of coal and coke; as, illuminating gas and coke-oven gas. **r. iron.** Having a high silicon content.

Richards, Theodore William. 1868–1928. An American chemist noted for his atomic weight determinations and experiments in physical chemistry.

richellite. A native iron, calcium phosphate from Richelle, Belgium.

Richter, Jeremias Benjamin. 1762–1807. A German chemist noted for his work on volumetric analysis and on stoichiometrical principles.

Jeremias Benjamin Richter.

R.'s law. Wenzel's law. Each equivalent weight of an acid will completely neutralize an equivalent weight of a base. **R., Victor von** 1842– . A German chemist noted as author of chemical textbooks.

ricin. An albuminous toxin of castor oil beans, the seeds of *Ricinus communis;* it agglutinates red blood corpuscles.

ricinate. Ricinoleate. A salt of ricinoleic acid.

ricinic acid. Ricinoleic acid.

ricinine. $C_{12}H_{12}O_2N_2$ = 216.1. An alkaloid from the leaves and seeds of the castor oil plant, *Ricinus communis*.

ricinoleate. Ricinate. A salt of ricinoleic acid.

ricinoleic acid. $C_{18}H_{34}O_3$ = 298.36. Ricinic acid, *12*-hydroxy-*9*-octadecanoic acid*, *10*-hydroxyoleic acid, elaeodic acid, $Me(CH_2)_5CHOH.CH:CH(CH_2)_7COOH$. A fatty acid from castor oil. A yellow, thick mass, d.0.945, m.17, b.$_{15mm}$250, insoluble in water, partly soluble in alcohol or ether. Its alkali salts are very soluble and detoxify antigens.

ricinolein. $C_{57}H_{104}O_9$ = 932.83. Glyceryl ricinoleate, triricinolein. The glycerol ester of ricinoleic acid, a constituent of castor oil (80 %).

Ricinus. The castor oil plant, *R. communis*, an Euphorbiaceae, whose seeds yield castor oil and ricinine.

rickardite. Cu_2Te_3. A copper mineral.

Rideal-Walker test. The determination of the value of an antiseptic from the amount required to prevent the growth of certain organisms (as *B. typhosus*) under standard working conditions. Phenol is taken as the standard of comparison. **R-W. value.** Phenol coefficient. Cf. *germicide*.

riebeckite. An oxide earth which contains Fe, Si, and Na.

riffles. (1) Small waves. (2) A corrugated surface. (3) A sampler, q.v.

rigidity. The state of being inflexible or stiff. **r. modulus.** Modulus of elasticity.

rimnic acid. An acid resin, the chief constituent of rimu resin.

rimose. Describing a bacterial culture which shows fissures and cracks.

rimu resin. A rose-red resin obtained from the rimu or red pine of New Zealand, *Dacrydium cupressinum*, a Coniferae.

ring. (1) A circular structure. (2) A closed chain of atoms. (3) A system of rings; as, the porphin r., cholane r. See also *ring structures*. **bacterial-** A growth of bacteria on the surface of culture media, which adheres to the glass forming a rim. **benzene-** See *benzene ring*. **fused-** Two or more r. having at least two atoms each in common. Cf. *spirane*. **heterocyclic-** A misnomer for heteroatomic r., or a heterocycle. See *ring structures*. **homocyclic-** A misnomer for homoatomic or carboatomic r. or homocycle. See *ring structures*. **Liesegang's-** See *rhythmic precipitation*. **Newton's-** See *Newton*.

r. breakage. The disruption of an atomic ring, or the change from an aromatic to an aliphatic compound. **r. closure.** Ring formation. **r. compound.** A compound in which the atoms of the molecules form a ring or closed chain; as, a cyclic compound. **r. formation.** Exo-condensation. The closing of an atomic chain; the change from an aliphatic to an aromatic compound. **r. reaction.** R. test. A chemical reaction (precipitate or color change) at the boundary between two liquids one of which has been superimposed as a layer on the other. Cf. *horismascope*. **r. structures.** The manifold atomic arrangements in aromatic compounds, the molecules of which may contain one, two, or more rings connected or joined by simple or double bonds or by a single atom (spiro compound). Classification (*Patterson*):

A. The compound consists of a SINGLE RING:
   1. Carbon atoms only..... Carbocyclic
      three atoms—cyclopropane
      four atoms—cyclobutane
      five atoms—cyclopentane
      six atoms—benzene, cyclohexane
   2. Carbon and some other atom(s). Heterocyclic
      The heterocyclic atoms are principally O, S, Se, Te, N, P, As, Sb, Si, Sn, Fe, Hg.

B. The compound consists of TWO or MORE RINGS; each of five or more atoms, but it does not contain an atomic bridge, a crossed valence bridge or a free spiro union.
   1. Carbon atoms only; *e.g.*,
      indene, *6*, 5.
      naphthalene, 6, 6.
      fluorene, 6, 6, 5.
      anthracene, 6, 6, 6.
      chrysene, 6, 6, 6, 6.
      dibenzanthracene, 6, 6, 6, 6, 6.

2. Carbon and other atom(s) *e.g.*,
one nitrogen..... indole, 6, 5.
cinnoline, 6, 6.

C. The compound consists of two rings joined by an ATOMIC BRIDGE or valence bridge; as, terpenes and derivatives.

D. The compound consists of TWO or MORE ATOMIC BRIDGES, as hexamethylenetetramine.

E. The compound consists of one or more SPIRO UNIONS.

r. symbol. A graphical representation of an atomic ring, as skeleton symbols or structure symbols. **r. system.** An arbitrary representation on a plane surface of the geometrical arrangement of atoms in the molecule of an aromatic substance. **r. test.** Ring reaction.

Ringer, Sidney. 1835–1910. An English physiologist noted for his experiments on the physical properties of protoplasm. **R. fluid, R. solution.** An isotonic solution of 0.7 % sodium chloride, 0.03 % potassium chloride and 0.025 % calcium chloride in water; used in physiological experiments. Cf. *saline, salt solution, Locke's solution.*

rinkite. The mineral $3NaF,4CaO,6(Ti,Si)O_2$, Ce_2O_3.

Rinmann's green. A pale-green mass, probably cobalt zincate, $CoZnO_2$, obtained by melting zinc compounds with a trace of cobalt salts. It is an identification test for zinc compounds in blowpipe analysis.

rinneite. A Stassfurt salt, $FeCl_2.3KCl.NaCl$.

rio arrowroot. Tapioca.

Rio Tinto process. The extraction of copper from its ores after oxidation by atmospheric exposure.

ripener. An agent that is used to ripen fruits which have been shipped unripe for better preservation. The fruits, such as dates, persimmons, bananas, avocados, etc., are placed in a chamber at 65°F. and exposed to ethylene gas, 1:1000, the gas being renewed each day.

ripening. (1) The natural process undergone by fruits, which consists of progressive hydrolytic changes by the action of enzymes: the fruit becomes sweeter, tannins and organic acids disappear, proteins are hydrolyzed, starch changes to sugar and some sugars form esters and the characteristic flavor develops. The cell wall undergoes changes, and the color generally deepens. (2) The gradual formation of light-sensitive centers in the emulsion of a photographic plate. (3) A process of fermentation (as of tobacco), in which organic catalysts may be used to produce maturity. (4) A stage in the manufacture of rayon in which the solution attains, naturally or otherwise, the necessary properties for successful spinning. **artificial-** Ripener.

ripidolite. The green or white mineral $(Al,Cr)_2O_3,5(Mg,Fe)O,3SiO_2,4H_2O$.

riptography. Analysis by a volumetric method in which a solution is titrated with a precipitating agent, and the properties of the clear layer obtained after shaking and allowing to settle, are measured.

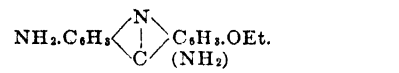
risic acid, rissic acid. $C_{11}H_{12}O_7$ = 256.09. *2*-carboxy-*4,5*-dimethoxy-phenoxy acetic acid. $C_6H_2(OMe)_2COOH.OCH_2COOH$. A split-product of rotenone; a lower homolog of derric acid. White crystals, m.262.

Ritz formula. An equation connecting the wave-number, n, of a line in a series of the spectrum with the universal series constant, N.

$$n = A - \frac{N}{[m + \mu + (d/m^2)]^2}$$

where m is an integer and A, μ and d are constants.

rivanol. $C_{15}H_{15}ON_3$ = 253.3. 2-ethoxy-6.9-diaminoacridine, ethodin,



A yellow crystalline powder, used as a local antiseptic in the treatment of abscesses and wounds. It is less toxic and more antiseptic than trypaflavine.

rivotite. A native, basic copper antimony carbonate.

Rn. The symbol for radon.

roan. Sheepskin tanned with sumach. Cf. *skiver.*

roast. (1) To heat with access of air. (2) The product obtained by heating substances, especially ores, in air. **r. gases.** The gases formed on roasting ores, especially sulfides. They consist mainly of sulfur dioxide and arsenious fumes, mixed with air and the gases of the fuel used.

roaster. Roasting furnace.

roasting. Oxidation of ores in a current of air in a furnace heated by wood, coal or oil. Roasting removes the sulfur and arsenic, and makes the ores more porous and, therefore, ready for chlorination or hyposulfitization. **r. furnace.** A long firebrick furnace; ore is fed into one end and gradually, by means of raffles or rakes, shuffled toward the firebox, and removed after about three hours of roasting. **r. temperature.** The temperature necessary for roasting depends upon the composition of the ore. The following temperatures indicate the reactions taking place:

100°C.....	water boils (removal of moisture)
250°C.....	Ag_2O decomposes
350°C.....	Sulfides begin to burn, and $CuSO_4$ is dehydrated
600°C.....	$FeSO_4$ decomposes to Fe_2O_3
653°C.....	$CuSO_4$ becomes basic
655°C.....	Ag_2SO_4 melts
702°C.....	Basic $CuSO_4$ decomposes to CuO
807°C.....	Ag_2SO_4 decomposes
1050°C.....	CuO forms Cu_2O
1100°C.....	Fe_2O_3 forms Fe_3O_4

robin. An albuminous toxin or poisonous nucleoprotein from the bark of the locust tree, *Robinia pseudacacia*, a Leguminosae of North America; used medicinally as an emetic and purgative.

robinin. A coloring material extracted from the heartwood of *Robinia pseudacacia*, locust.

robinose. $C_{18}H_{32}O_{14}$ = 472.2. A trisaccharide occurring with camphor in *Robinia* species; it hydrolyses to two molecules of rhamnose and one of glucose.

Robinson, Sir Robert 1886– . An English chemist noted for organic research.

Robiquet, Henri Edme. 1822–1860. A French chemist noted for work on fermentation and photography. The son of **R., Pierre Jean.** 1780–1840. A French chemist, noted as an analyst of vegetable materials.

Robison, Robert. 1884–1941. A British biochemist noted for his work on yeast and fermentation. **R. ester.** Glucose-6-phosphate, produced in the fermentation of sugar by yeast. Cf. *Neuberg ester.*

roburite. An explosive which consists of 87 % ammonium nitrate, 11 % dinitrotoluene, and 2 % chloronaphthalene.

Roccella. A genus of lichens, as *R. tinctoria,* litmus plant.

roccellic acid. $C_{20}H_{30}O_7$ = 372.15. A dibasic acid from *Roccella fuciformis,* a fungus or lichen. Colorless scales, m.178, soluble in hot alcohol, insoluble in water.

roccellin. Orseillin.

rochelle salt. Potassium sodium tartrate.

Rochleder, Friedrich. 1819–1874. An Austrian chemist noted for his work on plant analysis.

rock. Any native aggregation of mineral matter, an essential part of the earth crust. **basic-** See *basic r.* **igneous-** See *igneous.* **primary-** Rock that has not undergone weathering and disintegration. **secondary-** R. that has been altered by disintegration.

r. asphalt. Sandstone or limestone impregnated with asphalt. **r. breaker.** A machine that crushes rock. **r. candy.** Crystallized sucrose. **r. cork.** A variety of asbestos. **r. crystal.** A transparent and colorless variety of quartz. **r. gas.** Natural gas. **r. meal.** Calcium carbonate deposited from water. **r. milk.** A fine quality r. meal. **r. oil.** Petroleum. **r. quartz.** Quartz. **r. ruby.** A red variety of garnet. **r. salt.** Common table salt. Sodium chloride obtained in the solid form by mining; as distinguished from sea salt, which is obtained by evaporation. **r. sand.** The debris of abraded rock. **r. silk.** A variety of fine asbestos. **r. tallow.** Hatchettenine. **r. tar.** A crude petroleum. **r. wool.** A fibrous substance made by blowing a jet of steam against a small stream of molten lime and siliceous rock. Cf. *slag wool.*

rod. (1) Pole, perch. A unit of length in surveying: 1 rod = 25 links = 5½ yards = ¼ chain = 5.02921 meters. (2) A stick-shaped bacillus. **square r.** A unit of area in surveying, (272.25 sq. yards). Cf. *rood.*

rodinal. $NH_2C_6H_4.OH$ = 109.1. p-Aminophenol; used as a photographic developer.

Rœntgen. See *Röntgen.*

Roese-Gottlieb method. A method of determination of fat used in the analysis of milk, dairy products, flour, etc., in which the moist food is shaken with a mixture of ethyl ether and petroleum ether, and the separated ethereal layer evaporated in a weighed vessel.

Roesler's process. A method for separating copper and silver from gold by fusion with sulfur or antimony sulfide to obtain copper and silver sulfides.

Rohrbach's solution. An aqueous solution (d.-3.58) of barium and mercuric chlorides; used for determining the density of minerals by the suspension method.

Röhrig tube. A separating device for fat extraction, consisting of a 87.5-cc. glass tube with delivery tube so placed that the center line coincides with the 23-cc. surface of ether-water layer.

Roman cement. A cement made by heating clay and limestone. **R. ocher.** A native, deep orange variety of ocher. **r. vitriol.** Cupric sulfate.

romanium. An alloy of aluminum with a small percentage of tungsten, copper and nickel.

romeite. $5CaO.3Sb_2O_5$. A native calcium antimoniate.

rongalite. $CH_2O.NaHSO_2.H_2O$. An addition-produet of formaldehyde. Used in the textile industry as a substitute for sodium hyposulfite.

Röntgen, Wilhelm Konrad. 1845–1923. A German physicist noted for the discovery and description of x-rays in 1895. **r. rays.** X-rays. **r. ray analysis.** X-ray analysis. **r. tube.** See *x-ray tube.* **r. unit.** The international unit of *x-ray intensity,* q.v.

Wilhelm Konrad Röntgen.

röntgenogram. Radiogram. An x-ray photograph.

röntgenography. Radiography.

röntgenology. A branch of physics that deals with the study of x-rays.

rood. A surface measure, 1 rood = 1210 sq. yards; 40 roods = 1 acre. Cf. *rod.*

root. An underground portion of a plant that absorbs moisture and salts and conducts them to the leaves. It also maintains the plant in position, and may serve as a storage for reserve materials. Cf. *rhizome.* Several roots are used medicinally; official roots (U.S.P.) are:

Althaea	Glycyrrhiza	Rhubarb
Apocynum	Inula	Rumex
Asclepias	Ipecac	Sarsaparilla
Belladonna	Krameria	Senega
Bryony	Lappa	Stillingia
Calumba	Pareira	Sumbul
Gelsemium	Phytolacca	Taraxacum
Gentian	Pyrethrum	

Roozeboom, Hendrick Willem Bakhuis. 1854–1907. A Dutch chemist noted for his practical application of the phase rule.

ropiness. Stickiness or stringiness of an organic liquid (also beer, milk or bread) caused by the action of microorganisms of the B. mesentericus group (e.g., Acetobacter R.).

ropy. Possessing a sticky or stringy consistency.

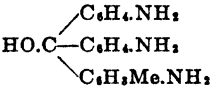
Rorrison's oil thief. A heavy glass tube with a valve, used for taking oil samples.

Rosaceae. Rose family, a group of herbs, shrubs or trees, several of which yield drugs and edible fruits.

Prunus virginiana	wild cherry bark
Prunus domestica	prune
Prunus persica	peach leaves
Pyrus malus	apple tree bark
Pyrus cydonia	quince seeds
Prunus amygdalus amara	bitter almonds, bitter almond oil
Prunus amygdalus dulcis	sweet almonds, sweet almond oil
Pyrus (Sorbus) aucuparia	sorbus
Quillaja saponaria	soap bark
Rosa gallica	red rose
Rosa damascaena	attar of roses
Rubus species	blackberry root

Rubus idaeus	raspberry
Crataegus oxyacantha	English hawthorn
Prunus laurocerasus	cherry laurel
Fragaria vesca	strawberry
Gillenia stipulacea	American ipecac
Agrimonia eupatoria	agrimony
Brayera anthelmintica	kousso
Potentilla anserina	silverweed
Potentilla canadensis	five-finger grass
Potentilla tormentilla	tormentil

rosaniline. $C_{20}H_{21}N_3O$ = 319.3. A triphenyl dye obtained by heating aniline and toluene with nitrobenzene:



Red needles, soluble in water or alcohol, insoluble in ether. Its hydrochloride is fuchsin. **r. hydrochloride.** Fuchsin.

rosanilines. Fuchsin or magenta dyes. The salts and derivatives of rosaniline.

Roscoe, Sir Henry Enfield. 1833–1915. An English chemist noted for his writings on inorganic and organic chemistry.

roscoelite. A vanadium-mica ore of California.

Rose process. The separation of gold from its ores by fusion of the zinc precipitates and aeration to oxidise the baser metals. These are removed as a borax-silica flux.

Rose, Friedrich. 1839– . A German chemist, noted for work on cobalt ammonia compounds. **R., Gustav** 1798–1873. A German chemist noted for his system of crystallography. **R., Heinrich** 1795–1864. A German chemist, and originator of the use of H_2S in qualitative analysis. Both were sons of **R., Valentin (the younger).** 1762–1807. A German chemist, noted for analytical methods (CO_2, As, P. etc.) and sons of **R., Valentin (the elder).** 1736–1771. A German chemist who first prepared *rose metal.*

rose. The dried petals of *Rosa gallica*, a Rosaceae. Used as the fluid extract as a tonic, and in perfumery. **cabbage-** The flower petals of *Rosa centifolia*, used for rose-water. **Christmas-** Black hellebore. **corn-** Red *poppy.* **dog-** The ripe fruit of *Rosa canina*, used for making pill-masses. It contains invert sugar, citric and malic acids.

r. bengal(e). Diiodoeosin. A red dye, used as adsorption indicator in the titration of chlorides by silver nitrate. **r. copper.** Rosette copper. **r. metal.** Rose's metal. An alloy of low melting-point: 2 pts. bismuth, 1 pt. tin and 1 pt. lead; m. 94. **r. oil.** An essential oil obtained by cold extraction of rose petals; used in perfumery. **r. quartz.** A pink variety of quartz, used as a gem. **r. vitriol.** Cobaltous sulfate.

rosein. Fuchsin.

roselite. A native hydrated oxide containing Ca, Co, Mg, and As.

rosellane. Rosite.

rosemary. Rosmarinus. **wild-** Labrador tea. **r. oil.** The volatile oil distilled from the fresh flowering tops of *Rosmarinum officinalis*, a Labiatae.

Rosenstein process. [Ludwig R. 1886– . American chemist.] A method of making hydrochloric acid from chlorine and water gas: $2Cl_2 + 2H_2O + CO \rightarrow CO_2 + 4HCl$.

Rosensthiel's green. Barium manganate.

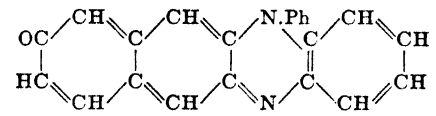
roseo-compound. One of the red cobalt ammines of the type, $Co(NH_3)_5X_3.H_2O$.

roseoquinine. A red color produced on adding fresh potassium ferricyanide solution to a solution of thalleo-quinine, q.v.

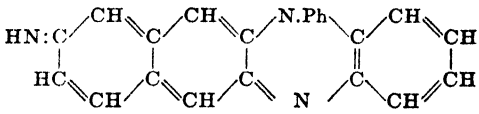
rosette. A disk with a centrally-arranged pattern of crystals. **r. copper.** A disk of copper formed on the surface of molten copper by sudden cooling with a spray of water.

rosin. Colophony. The resin remaining after distilling turpentine from the exudation of various species of pine; e.g., *Pinus palustris.* It contains abietic acid (80–90 %) and its anhydride. A yellow, brittle mass; insoluble in water, soluble in alcohol, ether, or chloroform. It is used as an insulating material for sizing paper and in plasters. **r. jack.** A yellow variety of sphalerite. **r. oil.** A blue fluorescent oil obtained by the destructive distillation of rosin and pitch; used as a lubricant. Cf. *retinol.* **r. spirit.** A mixture of hydrocarbons obtained in the destructive distillation of rosin. **r. tin.** A reddish variety of cassiterite.

rosindone. $C_{22}H_{14}N_2O$ = 322.12. Rosindulone. An aniline dye; red crystals, m.224, soluble in water.



rosinduline. $C_{22}H_{16}N_2$ = 321.26. An aniline dye, m.199; soluble in water.



r. scarlet. A red dye used as an oxidation-reduction indicator.

rosindulone. Rosindone.

rosinoil. Retinol. Cf. *rosin* oil.

rosinol. Retinol.

rosinweed. The dried root of *Silphium laciniatum.* A tonic and expectorant.

rosite. Decomposed anorthite.

rosmarinus. The dried leaves and plants of *Rosmarinus officinalis*, rosemary, a Labiatae. Used medicinally as the fluid extract, and as an aromatic in perfumery.

rosolic acid. $C_{20}H_{16}O_3$ = 304.2. Corallin, trioxytrimethylphenylmethane. Red scales with a green metallic luster, m.270 (decomp.), slightly soluble in water, soluble in hot alcohol or ether; used as an indicator and in the manufacture of aniline dyes. Cf. *aurin.*

rosterite. A light red variety of beryl.

rosthornite. $C_{24}H_{40}O$ = 344.3. A brown resin, d.1.076, found native in Carinthia.

rostone. A synthetic stone made from finely-ground shale or other alumino-silicate, mixed with slaked lime, moistened with 18–22 % H_2O, and pressed into shape.

rot. To decay or decompose.

rotamerism. Geometric *isomerism.*

rotameter. A non-recording indicator of the rate of flow of a fluid.

rotary. (1) Rotatory. (2) Revolving. **r. kiln.** A long drum, usually inclined, which rotates and can be heated. **r. movement.** A circling or twining motion.

rotate. To turn or twist.

rotation. The act of turning around an axis, or turning with a circular motion. **magnetic-** The optical activity of a liquid placed between magnetic poles. **molecular-** The quotient of the molecular weight by the specific rotation of a substance. **specific-** The arc through which a substance rotates the plane of polarized light when one gram of it is dissolved in one cc. of water and the length of the layer examined is one decimeter. It is given by:

$$[\alpha]_D^t = \frac{a}{ld},$$

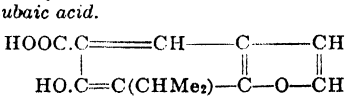
where α is the observed angle of rotation; l, the length of the layer of liquid in decimeters; d, the grams of substance in one cubic centimeter; and $[a]_D$ the specific rotation when the examination is made with the sodium flame (D line of the spectrum), at t°C. Cf. *polariscope.*

rotational. Pertaining to rotation.

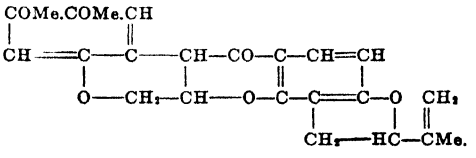
rotatory. Optically-active; capable of turning the plane of polarized light. **r. dispersion.** The ratio of the specific rotations of a substance observed with lights of two different wavelengths. **r. power.** Specific rotary power.

rotaversion. The rearrangement of a cis- to a trans-isomer, or vice versa.

rotenic acid. $C_{12}H_{12}O_4$ = 220.09. Isotubaic acid. White crystals, m.182, derived from rotenone. Cf. *tubaic acid.*



rotenone. $C_{23}H_{22}O_6$ = 394.15. Derrin. Tubatoxin, nicouline. A crystalline, insecticidal principle, m.163, from *derris root* (q.v.), *cube root* (q.v.) and *Cracca* (*Tephrosia*) *vogelii;* insoluble in water, soluble in ether.



It is harmless to birds and mammals, but 30 times as toxic as lead arsenate (to silkworms), 25 times as toxic as KCN (to goldfish), and 15 times as toxic as nicotine (to aphids). It crystallizes with many organic solvents, as:

rotenone-acetic acid....	$2C_{23}H_{22}O_6.CH_3COOH$
rotenone-benzene.....	$C_{23}H_{22}O_6.C_6H_6$
rotenone-carbon tetrachloride.....	$C_{23}H_{22}O_6.CCl_4$
rotenone-chloroform....	$C_{23}H_{22}O_6.CHCl_3$

rothic acid. $C_{14}H_{12}O_7$ = 292.1. A split-product of nucitannin.

rothoffite. A native, brown garnet, which contains magnesium, iron and calcium.

rotor. (1) The rotating portion of a piece of machinery, as distinct from the stationary portion (stator) around or inside which it revolves. (2) The spinning top of an ultracentrifuge; see *McBain's centrifuge.*

rotoscope. A stroboscopic instrument for the observation of rapid mechanical motion. Cf. *chronoteine.*

rotten. The state resulting from natural decomposition, or rot. **r. stone.** (1) Terra cariosa. A light, friable mineral from Derbyshire, England, which consists of fine grains of silica formed from the decomposition of siliceous limestone; used as a polishing material. (2) Tripoli.

rottisite. A native, hydrated nickel silicate.

rottlera. Kamala.

rottlerin. $C_{33}H_{30}O_6$ = 380.2. Mallotoxin, kamalin. The yellow coloring material of kamala. Minute crystalline leaflets of satin-like luster, m.200; soluble in ether or alkalis producing a dark red color.

Rouelle, Guillaume François. 1703–1770. A French chemist noted for his definitions of acids, bases and salts, and as the first physiological chemist.

rouge. (1) A dye made from safflower mixed with talc; used as a cosmetic. (2) A cosmetic which produces a flush of the skin. (3) Colcothar.

roughage. Fibrous material in food, usually fibrous cellulose, which stimulates the digestive and excretory organs by frictional contact with the alimentary tract.

Roussin's salt. Dark-colored salts of the type $K[Fe_4(NO)_7S_3]$, formed when nitric oxide is passed through a suspension of precipitated ferrous sulfide in a solution of potassium sulfide.

R.O.V. Refined oil of vitriol (95–96 % H_2SO_4).

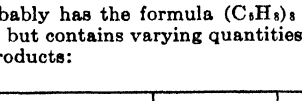
Rowland, Henry Augustus. 1848–1901. An American physicist, noted for his electrical and optical researches. **R.'s value.** The wavelength of any Fraunhofer line in the solar spectrum, as determined by Rowland.

rowlandite. A native silicate of yttrium, which contains cerium, lanthanum and thorium.

Royal Society of London. A society founded in 1662 for the furthering of natural and physical sciences.

Ru. Symbol for ruthenium.

rubber. Caoutchouc, elastica, india rubber. An elastic substance obtained from the coagulated milky juice (*latex*) of *Hevea* (Para rubber) and *Ficus* (India rubber) species. It contains the hydrocarbon unit



It probably has the formula $(C_5H_8)_8$ = 544.0, d.0.92, but contains varying quantities of oxidation products:

	High Grade	Low Grade
Hydrocarbons.....	90–93 %	25 %
Resins.....	2–4 %	60 %
Water, impurities, etc...	3–8 %	15 %

It is soluble in chloroform, carbon disulfide, ether or benzene. On destructive distillation it yields isoprene, dipentene and other hydrocarbons. The world output in 1940 was 1,280,000 long tons, coming from British Malaya > Dutch East Indies > Ceylon. Cf. *elastomer.* **guayule r.** Guayule. **hard r.-** Econite, vulcanite. **microporous r.** Mipor. **synthetic r.** Elastomer.

r. accelerators. See *accelerators.* **r. goods.** Articles prepared by mixing various substances

with r. and subjecting to vulcanization, (q.v.) acceleration (q.v.) and aging, q.v. **r. sources:**

Euphorbiaceae:
- *Hevea brasiliensis*..... **Para rubber**
- *Manihot*..... Cearea r., q.v., Manicoba.
- *Micrandra*..... Venezuelan r.
- *Sapium*..... Bolivian r., Columbian r.

Moraceae:
- *Ficus elastica*..... **India rubber**
- *Castilloa*..... Mexican r., West Indian r.

Apocynaceae:
- *Funtumia*..... African r. Ire, silk r.
- *Landolphia*..... vine r., Madagascar r.
- *Clitandra*..... Central African r.
- *Willoughbeia*..... Borneo r., Java r.
- *Hancornia*..... Mancabeira r.

Asclepiadaceae:
- *Asclepias*..... milkweed r.

Compositae:
- *Parthenium argentatum*... guayule r., q.v.

rubbone. $C_{10}H_{16}O$ (approx.). An orange-yellow viscous gum, produced by the atmospheric oxidation of rubber. Used in baking varnishes for the lacquer industry to accelerate the oxidation of polymerized linseed oil.

rubeane. $C_2H_4N_2S_2$ = 120.2. Rubeanhydride, carbon disulfhydrate. The diamide of thioxalic acid,

$$\begin{matrix} NH_2.C:S \\ | \\ NH_2.C:S \end{matrix}$$

obtained by heating hydrogen sulfide and cyanogen. Red crystals, soluble in water, alcohol or ether, used as a micro-test for copper. Cf. *flavcanhydride*.

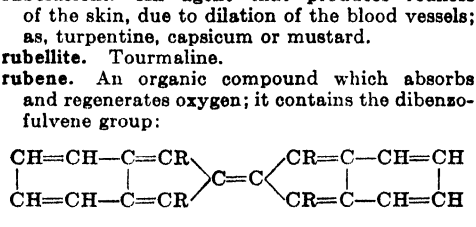
rubeanhydride. Rubeane.

rubeanic acid. Rubeane.

rubefacient. An agent that produces redness of the skin, due to dilation of the blood vessels; as, turpentine, capsicum or mustard.

rubellite. Tourmaline.

rubene. An organic compound which absorbs and regenerates oxygen; it contains the dibenzofulvene group:



diphenylditolyl- $C_{44}H_{30}$ = 558.2. White crystals, m.375, having a violet fluorescence. **tetraphenyl-** Rubrene.

ruberite. Cuprite.

ruberythric acid. Rubianic acid.

ruberythrinic acid. Rubianic acid.

rubia. Madder. The dried root of dyer's madder, *Rubia tinctorium*, a Rubiaceae.

Rubiaceae. The madder family, a group of herbs, shrubs or trees that yield important drugs, including quinine and coffee.

roots:
- *Cephaelis ipecacuanha*... ipecac, emetine
- *Cephaelis acuminata*..... Carthagena ipecac, psychotrine.
- *Chiococca racemosa*..... cahincic acid
- *Rubia tinctorum*..... madder, alizarin

bark:
- *Cinchona* species..... Peruvian bark quinine alkaloids
- *Coryanthe yohimbe*..... yohimbehe
- *Remijia pedunculata*..... cuprea bark
- *Cephalanthus occidentalis*. pond dogwood

herbs:
- *Mitchella repens*..... squaw vine
- *Galium aparine*..... cleavers

seeds:
- *Coffea arabica*..... coffee

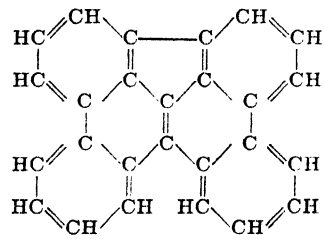
extract:
- *Gardenia lucida*..... kambi
- *Ourouparia gambir*..... gambir

Cf. the *alkaloids:* cheiramidine, cheiramine, mitragynine, mitraversine, palicourine; *glucosides:* danain, pinckneyin; and *coloring matter:* crocin.

rubianic acid. $C_{26}H_{28}O_{14}$ = 564.22. Ruberythric or ruberythrinic acid. A glucoside from rubia, that hydrolyses to glucose and alizarin. Yellow, silky prisms, m.259.

rubicelle. Spinel.

rubicene. $C_{26}H_{14}$ = 326.1. The aromatic hydrocarbon:



Deep red needles, m.305, insoluble in water.

rubidine. $C_{11}H_{17}N$ = 163.14. A pyridine base, q.v.

rubidium. Rb = 85.48. An alkali metal and element, atomic number 37, discovered by Bunsen (1861). It occurs as a soft, white metal resembling potassium, d.1.52, m.38, b.696, decomp. in water or alcohol, soluble in ether. It is found in small quantities in Stassfurt salts, in lepidolite, leucite and mineral waters. **r. acetate.** $RbC_2H_3O_2$ = 144.4. Colorless crystals; soluble in water. **r. alum.** Aluminum rubidium sulfate. **r. ammonium bromide.** $RbBr.4NH_4Br$ = 545.4. A white or slightly yellowish crystalline powder, soluble in water; used medicinally as a hypnotic. **r. bichromate.** Rubidium dichromate. **r. bitartrate.** $RbHC_4H_4O_6$ = 234.4. Colorless prisms; soluble in water. **r. bromide.** RbBr = 165.4. Regular, colorless crystals, d.3.35, m.683, soluble in water, alcohol, or ether; used medicinally as a nerve sedative. **r. carbonate.** Rb_2CO_3 = 230.90. Colorless deliquescent crystals, m.837, soluble in water, alcohol or ether. **r. chloride.** RbCl = 120.91. A colorless crystalline powder, d.2.20, m.710; soluble in water or alcohol. **r. chromate.** Rb_2CrO_4 = 286.9. Yellow crystals; soluble in water or alcohol. **r. dichromate.** $Rb_2Cr_2O_7$ = 386.9. Orange-red crystals; soluble in water. **r. fluoride.** RbF = 104.4. A white, crystalline powder; soluble in water. **r. fluosilicate.** Rb_2SiF_6 = 312.94. White octahedral crystals, d.3.338, slightly soluble in water. **r. hydride.** RbH = 86.45. Colorless needles, d.2.0, decomp. 300. **r. hydroxide.** RbOH = 102.5.

A grayish-white deliquescent powder, d.3.20, soluble in water, alcohol or ether; used in the manufacture of glass and rubidium salts. **r. iodate.** $RbIO_3$ = 260.4. Colorless prisms; soluble in water. **r. iodide.** RbI = 212.4. Colorless cubical crystals, d.3.02, soluble in water; used medicinally as an alterative. **r. ion.** The monovalent cation, Rb^+. **r. nitrate.** $RbNO_3$ = 147.5. Colorless hexagonal crystals, d.3.09; soluble in water or alcohol. **r. oxide.** Rb_2O = 186.9. Colorless octahedral crystals, d.3.72; soluble in water, alcohol or ether. **r. perchlorate.** $RbClO_4$ = 184.91. Colorless crystals. **r. peroxide.** Rb_2O_2 = 202.9. Yellow needles, d.3.65, m.600, decomp. by water. **r. platinichloride.** Rb_2PtCl_6 = 578.9. Yellow crystals, soluble in water, but not in alcohol. **r. sulfate.** Rb_2SO_4 = 266.96. Large, colorless, rhombic crystals, d.3.61, m.1051, soluble in water or alcohol; used medicinally as a cathartic. **r. sulfide.** $Rb_2S.4H_2O$ = 275.0. Colorless crystals; soluble in water or alcohol. **r. sulfite.** Rb_2SO_3 = 250.9. A colorless crystalline powder; soluble in water. **r. tartrate.** $Rb_2C_4H_4O_6$ = 318.8. Colorless crystals; soluble in water. *acid-* $RbHC_4H_4O_6$ = 234.48. White prisms, d.2.282, slightly soluble in water.

rubijervine. $C_{26}H_{41}O_2N$ = 401.34. An alkaloid from *Veratrum album* and *V. viride*, Liliaceae; m.236.

rubine. Fuchsin.

rubitannic acid. $C_{14}H_{22}O_{12}.\frac{1}{2}H_2O$. A tannin from the leaves of *Rubia tinctorium*.

rubixanthin. $C_{40}H_{55}OH$ = 552.4. An orange carotinoid (q.v.) pigment from *Rosa rubiginosa*.

rubrene. $C_{41}H_{28}$ = 518.22. Phenyl ethinyl diphenylmethane, tetraphenyldibenzodifulvene. A red and fluorescent, solid hydrocarbon, m.331. When illuminated in contact with air it forms **oxyrubrene,** $C_{41}H_{28}O_2$, which dissociates when heated, to $C_{41}H_{28}$ and O_2. This reversible oxidation is unique. Cf. *hemoglobin, rubene.* **r. bromide.** A solid having the highest melting point (500°C) of any known organic compound.

rubrocyanine. Ruhrgasol.

rubroglaucine. $C_{16}H_{12}O_5$ = 284.0. A red pigment related to auroglaucine, q.v.

rubrones. A group of substances prepared by bubbling air or oxygen through a solution of rubber in presence of cobalt linoleate as catalyst. Used in paints and varnishes, and for molding purposes.

rubrum scarlatinum. Scarlet R.

Rubus. (1) A genus of shrubs and herbs of the order Rosaceae, (q.v.). (2) Blackberry, cloudberry, dewberry, fingerberry. The dried bark of the rhizomes of Rubus species, which contain tannin; used as an astringent.

Rubus chamaemorus	cloudberry
Rubus fructicosus	English blackberry
Rubus idaeus	raspberry
Rubus villosus	American blackberry

ruby. Al_2O_3. A clear, red, transparent corundum; used as a gem. It is similar to sapphire. **artificial-** A red crystalline "gem" made by fusing chromium sesquioxide and powdered alumina at a high temperature.

r. alamandine. Spinel. **r. arsenic.** Realgar. **r. balas.** Spinel. **r. blende.** A red variety of sphalerite. **r. copper.** Cuprite. **r. glass.** A dark red glass, that has been colored by the addition of a small quantity of gold held in colloidal suspension. The ordinary red glass is colored by selenium. **r. mica.** Goethite. **r. silver.** Proustite. **r. spinel.** Spinel. **r. sulfur.** Realgar.

Rudolfi's equation. The degree of ionization, α, related to the dilution, v: $\frac{\alpha^2}{(1-\alpha)\sqrt{v}}$ = constant. (See also *dilution law, Ostwald's law.*)

rue. Ruta. The dried shrubby plant, *Ruta graveolens*. It is used as a condiment and contains rutic and rutinic acid. **r. oil.** Oleum rutae. An essential oil from the leaves of *Ruta graveolens*. A greenish liquid, d.0.837, b.230, insoluble in water, miscible with alcohol. It contains methyl-nonylketone and lauric aldehyde.

ruflanic acid. Quinizarin sulfonic acid, *1.4*-dioxyanthraquinone-*2*-sulfonic acid. A white crystalline powder, used as reagent for the separation of amino acids.

rufigallic acid. $C_{14}H_8O_8,2H_2O$ = 340.16. *1.2.-3.5.6.7*-Hexahydroxyanthraquinone, $C_{14}H_2O_2(OH)_6$. Orange-reddish needles; insoluble in water, soluble in alcohol, acids or alkalis. Used as dye, and sublimes if heated.

rufigallol. $C_{14}H_8O_8$ = 322.2. *1.2.3.6.7.9*-Hexahydroxyanthraquinone. Red crystals.

rufin. $C_{21}H_{20}O_8$ = 400.2. A resinous mass obtained by heating phlorizin; soluble in alkalis (red color).

ruflopin. $C_{14}H_8O_6$ = 272.13. Tetrahydroxyanthraquinone. An orange crystalline powder; soluble in alcohol.

rufol. $C_{14}H_{10}O_2$ = 210.1. 1.5-Dihydroxy-anthracene, 1.5-anthradiol, 1.5-anthracenediol*. Yellow needles; soluble in alcohol (blue fluorescence); decomp. 265.

Ruhmkorff, Heinrich Daniel. 1803–1877. A German electrician, who invented electrical devices. **R. coil.** An induction or spark coil.

ruhrgasol. A mixture of CO_2, CO, H_2, N_2 and C_3- and C_4- aliphatic hydrocarbons (35 % by vol. of C_3H_6) recovered from coke-oven gas, and used as an auto-fuel in Germany.

rule. (1) An empirically-found relationship of physical and chemical properties; as, *Crum Brown rule.* Cf. *theory, law hypothesis.* (2) A

Benjamin Thompson, Count Rumford.

ruler. **phase-** See *phase* rule. **slide-** See *slide rule.*

rum. An alcoholic distillation from fermented molasses. **bay-** See *bay-rum.*

rumbatron. A device to produce high-speed electrons for molecular bombardment, q.v. Cf. *cyclotron.*

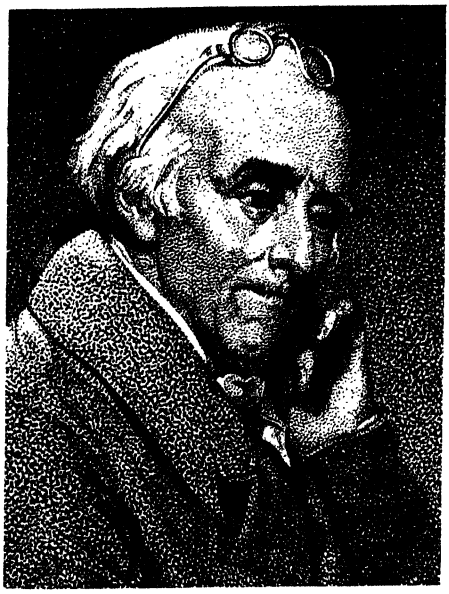
rumex. Yellow dock, yellow jasmine. The dried roots of *Rumex crispus*, a Polygonaceae. Used medicinally as the fluid extract.

Rumford, Count. 1753–1814. Benjamin Thompson, an American scientist noted for his work on the nature of heat, and co-founder of the Royal Institution of London.

rumicin. $C_{15}H_{10}O_4$ = 254.08. Yellow crystals, m.182, from the roots of *Rumex crispus.* It resembles chrysophanic acid.

Runge, Friedlieb Ferdinand. 1795–1867. A German chemist, noted as a writer and discoverer of aniline. Cf. *aniline.*

Rupert's drops. See *Prince Rupert's drops.*



Benjamin Rush.

Rush, Benjamin, 1745–1813. An American physician and pioneer in chemical education, noted as the first American author and professor of chemistry.

Russell-Saunders notation. See *quantum numbers.*

russellite. $Bi_2O_3.WO_3$ = 698.0. A mineral, which occurs sparingly as yellow pellets, in concentrates of tungsten ores in Cornwall, England.

russium. Rs. The undiscovered ekacesium, supposed to be radioactive. (Chem. News, 1927, p. 310.) Cf. *verium.*

rust. (1) An iron oxide mixed with hydroxides and carbonates, that forms on the surface of iron exposed to moisture and air. (2) A red fungus on grain.

rust-proofing. Plating a metal with a less corrodable metal, as tin, cadmium or zinc (see *galvanizing, sherardizing*).

ruta. Rue.

Rutaceae. Rue family. A group of plants that yield acrid resinous principles and essential oils.

root:	
Xanthoxylum senegalense...	artarine
herb:	
Peganum harmala.....	harmel
barks:	
Xanthoxylum americanum..	prickly ash bark
Galipea (Cusparia) officinalis	angostura bark
Ptelea trifoliata.....	wafer ash bark
leaves:	
Barosma betulina.....	buchu
Pilocarpus jaborandi.....	jaborandi
Ruta graveolens.....	rue
fruits:	
Aegle marmelos.....	bael fruit
Xanthoxylum species.....	prickly ash fruit

Cf. *casimirin, carana, curry, skimmianine, xanthopicrin.*

ruthenate. A compound of the type, M_2RuO_4, in which M is a monovalent metal. They are dark-red colored salts, soluble in water, and derived from hexavalent ruthenium. **per-** A compound of the type $MRuO_4$; as, $NaRuO_4$ which forms dark green crystals, soluble in water.

ruthenic. A compound derived from tetravalent ruthenium; as, $RuCl_4$.

ruthenious. Ruthenous. A compound derived from divalent ruthenium: as, **r. chloride.** $(RuCl_2)_x$ = $(172.61)_x$. Ruthenium dichloride. A dark blue solid, insoluble in water.

ruthenium. Ru = 101.7. A rare metallic element of the platinum group, atomic number 44. It occurs as a gray or silver-like, brittle metal, d.12.06, which melts in the electric arc; insoluble in water or acids. It appears to have every positive valency from 1 to 8, and forms coordination compounds and also double salts. **r. bromide.** $RuBr_3$ = 341.7. Dark hygroscopic crystals; soluble in water.

+2; Ru^{++}, ruthenious.....	blue
+3; Ru^{+++}, ruthenic.....	gray
+4; RuO_3^{--}, ruthenite.....	yellow
+6; RuO_4^{--}, ruthenate.....	orange-red
+7; RuO_4^{-}, perruthenate.....	green
+8; RuO_5^{--}.....	red

r. carbonyl. $Ru(CO)_x$. Orange crystals. **r. chloride.** (1) *di-* Ruthenious chloride. (2) *tri-* $RuCl_3$ = 208.1. Ruthenic chloride. Ruthenium sesquichloride, Ru_2Cl_6. Deliquescent, brown crystals, soluble in water, decomp. by alcohol; used medicinally as an antiseptic, and industrially as a catalyst. (3) *tetra-* $RuCl_4$ = 196.70. Orange crystals, soluble in water. **r. fluoride.** RuF_5 = 196.70. Dark green crystals, d.2.963, m.101, b.270, decomp. in water. **r. hydrochloride.** $RuCl_4.2HCl$ = 320.6, or H_2RuCl_6. Chlororuthenic acid. Orange crystals, soluble in water. **r. hydroxide.** (1) $Ru(OH)_3$ = 192.8. A black powder; insoluble in water, slightly soluble in alkalis. (2) $Ru_2O_3.xH_2O$. Ruthenic hydroxide. A yellow powder, slightly soluble in water. (3) $RuO_2.xH_2O$. R. tetrahydroxide. Black powder, insoluble in water. **r. minerals.** R. is found in nature associated with the platinum metals, and occurs as:

native ruthenium.....	Ru
laurite.....	RuS_2

r. oxide. (1) RuO_2 = 133.8. R. dioxide. A violet crystalline powder d.7.2, insoluble in water, alcohol or ether. It is formed by the action of oxygen upon hot ruthenium. (2) Ru_2O_3 = 251.44. R. sesquioxide. A brown powder; insoluble in water, alcohol or ether. (3) RuO_4 = 165.7. R. tetroxide. A rhombic, yellow crystalline powder, d.3.28, m.25, b.-100; insoluble in water, alcohol or ether. (4) Ru_2O_5 = 283.40. R. pentoxide. A black powder. (5) Ru_2O_9 = 550.80. R. monoxide. A black powder, insoluble in water. **r. oxychloride.** $Ru(OH)Cl_2$ = 189.63. Ruthenium red. A red powder. *ammoniated-* $Ru(OH)Cl_2.3NH_3.H_2O$ = 258.75. A brown-red powder; soluble in water. Used as a reagent for pectin, plant mucin, gums, and as a microscope stain. **r. red.** R. oxychloride. **r. sesquichloride.** R. chloride. **r. sesquioxide.** R. oxide (2). **r. silicide.** RuSi = 129.76. Metallic prisms, d.5.40, insoluble in water. **r. sulfide.** RuS_2 = 165.82. Laurite. Gray cubic crystals, d.6.99, insoluble in water. **r. tetroxide.** R. oxide (3).

ruthenous. Ruthenious.

Rutherford, Daniel. 1749–1819. A Scotch botanist who discovered nitrogen in 1772. **R., Lord Ernest.** 1871–1937. A British physicist, (born in New Zealand) noted for his research on radioactive transformation, disintegration of nitrogen, and the structure of the atom. **R. atomic theory.** An atom consists of a small positive nucleus with A free positive charges in its nucleus (A is the atomic number), surrounded by a system of A electrons in outer levels. In addition the nucleus is made up of equal numbers of positive and negative charges, which balance one another. The weight of the atom is centered in the nucleus.

rutherfordite. A mixed native phosphate of cerium, lanthanum and didymium.

rutic acid. (1) $C_{10}H_{20}O_2$ = 172.15. A monobasic acid from rue. (2) Capric acid.

rutile. TiO_2. A native titanium oxide, in dark tetragonal crystals. It is a source of titanium compounds. Cf. *brookite, sagenite.*

rutin. (1) $C_{27}H_{32}O_{16}$ = 612.25. A hydroxyflavone gluco-rhamnoside from cowslip, tomato, tobacco, California poppy and herb-of-grace. Yellow needles m.190. (2) Barosmin.

rutinic acid. $C_{25}H_{28}O_{15}$ = 568.3. The coloring material of rue, *Ruta graveolens.*

rutonal. $C_{11}H_{10}N_2O_3$ = 218.1. Phenyl methyl barbituric acid. White crystals, m.227.

Rydberg, Johannes Robert. 1854–1919. A Swedish physicist, noted for his theories. **R.'s formula.** An equation which relates ν, the frequency vibration of the light, to the numbers of the initial and final orbits of electrons:

$$\nu = k\left(\frac{1}{n^2} - \frac{1}{n'^2}\right),$$

where n is the number of the inner, and n′ that of the outer orbit in a given jump. **R. fundamental constant.** The value N = 109678.8, in the expression $N = V_0/c$, where c is the velocity of light and V_0 is R. frequency constant. **R. fundamental frequency constant.** The value, $V_0 = 3.28880 \times 10^{15}$ sec.$^{-1}$ in the expression, $V_0 = cN$. Cf. *Ritz formula.* **R. number.** Ordinal number. **R. relation.** The atomic number, A, is related to the frequency, ν, of the characteristic radiation by, $\nu = \frac{3}{4}V_0(A - n)^2$, where n is a constant nearly equal to unity.

rye. The grain of *Secale cereale*, used in making bread. **spurred-** Ergot.

S

S. The symbol for: (1) Sulfur. (2) Entropy. (3) Black (German: Schwarz) in color names. **S acid.** 1-Amino-8-naphthol-4-sulfonic acid. **2S acid.** 1-Amino-8-naphthol-2.4-disulfonic acid. **S. yellow.** Naphthol yellow.

s. An abbreviation for: (1) symmetrical, (2) secondary, (3) second. (4) Symbol for solubility. **s state.** See *state.*

σ. The Greek letter "sigma." (1) The symbol for $\frac{1}{10000}$ second. (2) A prefix indicating the syn-position. (3) The symbol for stopping power.

Σ. The Greek capital letter "sigma." (1) The symbol for summation. (2) **Σ reaction.** The Wassermann test for syphilis.

∫. The symbol for integration. Cf. *f* = function.

S.A.E. See *S.A.E. classification.*

SDO. Synthetic drying oil, q.v.

S.U.P. *p*-Benzoyl-*p*-aminobenzoyl-*1*-amino-*8*-naphthol-*3.8*-sodium sulfonate, an effective conductor for colloids; a substance which supplies to colloidal particles the electrons necessary to stabilize the system.

S.T. An abbreviation for surface tension. **S.T.-37.** A solution of hexylresorcinol in glycerol and water; it has a surface tension of 37 dynes and is used as a germicide on account of its great ability to penetrate the microscopic crevices of bodies. It is claimed that this solution destroys bacteria in 15 seconds.

S.T.P. An abbreviation for standard temperature and pressure.

Sa. The symbol for samarium (U. S. A.); *Sm* in European practice.

sabadilla. Cevadilla, Indian barley. The dried ripe seeds of *Veratrum sabadilla* or *Schoenocaulon officinale*, a poisonous Liliaceae of Mexico and Central America, used to destroy vermin. It contains veratrine, cevadine and sabadine.

sabadilline. $C_{34}H_{52}O_8N$ = 523.6. Cevadilline. An alkaloid from sabadilla. Cf. *cevilline.*

sabadine. $C_{29}H_{51}O_8N$ = 541.0. An alkaloid obtained from sabadilla and veratrum; short colorless needles, m.238.

sabadinine. $C_{27}H_{45}O_8N$ = 511.5. An alkaloid from sabadilla; colorless needles, m.160, soluble in alcohol.

sabal. Saw palmetto berries. The partly dried, ripe fruit of *Serenoa serrulata* (*Sabal serrulata*), a Palmaceae. Used medicinally as the fluid extract, as a tonic sedative. **s. fiber.** The split leaves from *Sabal palmetto*, thatch palm; used for matting.

sabalol. The active principle of sabal.

Sabatier, Paul. 1854–1941. A French chemist, noted as pioneer in the hydrogenation of vegetable oils and Nobel Prize winner (1912).

sabatrine. $C_{51}H_{86}O_{17}N$ = 984.9. An alkaloid from sabadilla seeds.

sabbatia. American centaury. The dried herb of *Sabbatia angularis*, a Gentianaceae; used medicinally as a febrifuge. Cf. *erythrocentaurin.*

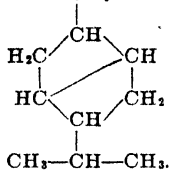
sabbatin. A glucoside from *Sabbatia elliottii*, quinine flower.

Paul Sabatier.

sabina. Savine.

sabina oil. Savine oil.

sabinane. $C_{10}H_{18}$ = 138.14. The terpene



It gives the radical thujyl. **6-keto-** Thujone.

sabinene. $C_{10}H_{16}$ = 136.2. A hydrocarbon from savine oil. A colorless liquid, d.0.840, b.163, insoluble in water, soluble in alcohol or ether.

sabinic acid. $C_{12}H_{24}O_3$ = 216.3. λ-Hydroxylauric acid, *12*-hydroxydodecanoic acid*, $HO(CH_2)_{11}COOH$, from savine and juniper oils.

sabinol. $C_{10}H_{16}O$ = 152.2. 6-Hydroxysabinene. An alcohol from savine oil.

sabromin. $Ca(C_{22}H_{41}O_2Br_2)_2$ = 1034.41. Calcium dibrombehenate. A white powder, insoluble in water, alcohol or acetone, soluble in ether; used medicinally as a hypnotic.

saccharamide. $C_6H_{12}O_6N_2$ = 208.1. The amide of saccharic acid, $(CHOH)_4(CONH_2)_2$.

saccharase. Invertase.

saccharate. Sucrate. (1) A salt of saccharic acid. (2) A compound of a saccharide and a metallic oxide; as, $CaO.C_{12}H_{22}O_{11}.H_2O$, monocalcium saccharate.

saccharetin. $(C_8H_7O_0)_n$. The yellow encrusting matter of sugar cane; it is probably a phlobaphen.

saccharic acid. $C_6H_{10}O_8$ = 210.11. Tetrahydroxyadipic acid. The dibasic acid, $(CHOH)_4(COOH)_2$, obtained on oxidation of dextrose and other hexoses. It is very soluble in water, alcohol or ether. Cf. *saccharinic acid, ascorbic acid, mucic acid.*

saccharide. (1) A compound of an organic base with sugar; as, casein saccharide. (2) See *monosaccharides, disaccharides, polysaccharides, carbohydrates.*

saccharification. (1) Conversion into sugar. (2) Impregnation with sugar solutions; as, occasionally in malting.

saccharify. To convert starches into sugar.

saccharimeter. A device for determining the amount of sugar in a solution; as, a polariscope, hydrometer, or fermentation tube. Cf. *saccharometer.*

saccharimetry. The determination of the optically-active sugar content of a solution from its optical activity.

saccharin, saccharine. $C_7H_5O_3NS$ = 183.1. Gluside, sykose, benzosulfimide, benzoylsulfonic imide, saccharinose, sulfobenzoic acid imide, saccharinol, glucid, saccharol, sulfinid, guarantose, saxin, agucarina, 1-benzosulfonazol-2(1)-one. The anhydride of o-sulfaminbenzoic acid: $C_6H_4\langle^{SO_2}_{CO}\rangle NH$. A white crystalline powder, m.220 (decomp.), slowly soluble in water, and 400 times sweeter than cane sugar; used as a sugar substitute and sweeting agent. **soluble-** The sodium salt of saccharin. It is often s. mixed with $NaHCO_3$. **s. sodium.** (1) Soluble s. (2) A lactone of a saccharic acid.

saccharinic acid. $C_6H_{12}O_6$ = 180.09. A group of acids obtained by oxidation of sugars (24 possible isomers). **gluco-** Glucosaccharic acid, 2-methylpentanetetrol carboxylic acid. $CH_2OH.(CHOH)_2.CHMe.COOH$, obtained from glucose and fructose (8 isomers). **iso-**

$$CH_3OH.CHOH.CH_2.COH(CH_2OH).COOH$$

from milk sugar and cellulose (4 isomers), **meta-** $CH_2OH(CHOH)_2CH_2.CHOH.COOH$ (8 isomers). **para-** $CH_2OH.CH_2.COH(COOH).CHOH.CH_2OH$, from galactose and milksugar (4 isomers). These all form lactones when their aqueous solutions are evaporated. Cf. *saccharic, saccharonic,* and *ascorbic acids.*

saccharinose. A brand of saccharin.

saccharobiose. Sucrose.

saccharol. Saccharin.

saccharolactic acid. Mucic acid.

saccharometer. A fermentation tube.

saccharomyces. Yeasts (q.v.) which ferment sugar. **S. unit.** S.U. A unit of vitamin H (q.v.) activity.

saccharon. $C_6H_8O_6$ = 176.1. The lactone of saccharonic acid.

saccharonic acid. $C_6H_{10}O_7$ = 194.1. A group of acids, $HOOC.CMeOH.(CHOH)_2.COOH$, obtained by oxidation of sucrose. Large colorless crystals, soluble in water.

saccharose. Sucrose.

saccharum officinarum. Sugar cane.

S.A.E. classification [Soc. of Automotive Engineers]. The grouping of steel alloys by numbers which indicate their composition. The first number shows the alloying metal or the type of steel:

1—carbon
2—nickel
3—chromium and nickel (nickel-chrome)
4—molybdenum (moly)
5—chromium (chrome-carbon)
6—chromium and vanadium
7—tungsten
9—silicon and manganese

The second number is the percentage of the principal alloying metal; and the third and fourth numbers, the percentage of carbon. Thus the classification: "*SAE* 2320" indicates a nickel steel containing 3 % nickel and 20 % carbon. A similar classification is in use by the U. S. War Department, abbreviated W.D. instead of S.A.E. **S.A.E. number.** A measure of the relative viscosity of lubricating oils, related to the Saybolt universal viscosity as follows:

S.A.E. number	Saybolt seconds	
	130°F	210°F
10	90–120	
20	120–185	
30	185–255	
40	255–	–75
50	.....	75–105
60	.....	105–125
70	.....	125–150

safety. The avoidance of hazards, q.v. **s. lamp.** Miner's lamp. **s. tube.** A device used to oppose the effects of sudden pressures or sudden flows of liquids.

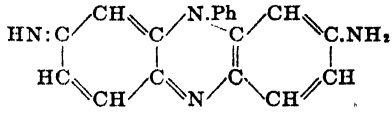
safflorite. (Fe, Co)As_2. A native, rhombic iron cobalt arsenide.

safflower. Carthamus.

saffron. Crocus. The dried stigmas of *Crocus sativus,* an Iridaceae, containing the glucoside crocetin. Used as a yellow coloring material in foods and confectionary, and as a dye, carminative and emmenagogue. **American-, bastard-, false-** Carthamus. **Indian-** Turmeric. **meadow-** Colchicum. **s. bronze.** Orange *tungsten.* **s. glucoside.** Crocetin. **s. of mars.** Ferric subcarbonate. **s. substitute.** Dinitrocresol.

safranal. $C_{10}H_{14}O$ = 150.1. An aldehyde occurring in saffron as the glucoside pikrococin: $CHO.C:CMe.CH:CH.CH_2.CMe_2$.

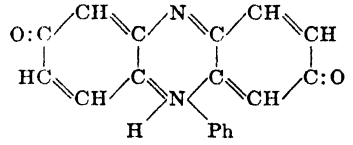
safranine. $C_{18}H_{14}N_4$ = 286.1. Phenosafranine. A phenazine dye. It is used as a stain in microscopy and the textile industry.



safranines. Derivatives of safranine or its salts, as safranine hydrochloride, methylsafranine.

safraninol. $C_{18}H_{13}ON_3$ = 287.2. A derivative of safranine, in which the :NH group is replaced by the keto-oxygen, :O.

safranol. $C_{18}H_{12}O_2N_2$ = 288.2.



safrene. $C_{10}H_{16}$ = 136.1. A terpene obtained from sassafras oil.

safrole. $C_{10}H_{10}O_2$ = 162.13. Allylpyrocatecholmethylene ether, shikimol, 1-allyl-3.4-methylenedioxy-benzene, $C_6H_3(OCH_2O).CH_2.CH:CH_2$-(3:4.1). A constituent of sassafras oil, camphor wood and other plants. A clear colorless oil, d.1.14, m.10, b.233, insoluble in water and soluble in alcohol; used as an anodyne and in synthetic perfumes. **iso-** $C_6H_3(OOCH_3).CH:CH.CH_3$. A liquid, b.251, soluble in ether, insoluble in water.

safron. Saffron.

safrosin. $C_{22}H_8O_5Br(NO_3)_2$. A scarlet-red dye, chiefly dinitrodibromofluorescein; used in dyeing silk and wool.

sagapenum. A gum resin from *Ferula persica*, an umbelliferous plant.

sagaresitannol. $C_{24}H_{27}O_4$ = 379.3. An acid resin obtained from sagapenum. It yields oxypicric acid on oxidation.

sage. Salvia. **s. brush.** Artemisia. **s. oil.** The essential oil of *Salvia officinalis*, d.0.915–0.925, soluble in alcohol, and containing cineol, thujone and pinene.

sagenite. Silica containing rutile.

sago. (1) A starch extracted from the pith of various palms, chiefly the *Metroxylon Rumphii* of India and the East Indian islands; used as a food. (2) The pith of several palms and tree ferns; as, Palmaceae, (q.v.), Cyatheaceae (tree ferns) and Cycadaceae.

Sahli's stain. A solution of borax and methylene blue in water; used to stain nerve tissues and cell nuclei.

sahlite. Augite containing iron.

Sainte-Claire Deville, Etienne Henri. 1818–1881. A French chemist noted for mineralogical and inorganic research (dissociation).

Saint Ignatius bean. Ignatia.

Saint John's bread. Carob beans.

saiodine. Sajodin.

sajodin. $Ca(C_{22}H_{42}O_2I)_2$ = 974.1. Calcium monoiodobehenate. A light yellow powder, insoluble in water; used medicinally.

saké, saki. A Japanese beer prepared from rice, water, tané-koji, and saké yeast. It is a transparent, yellow, aromatic liquid with pleasant taste, and contains 13–14 % ethyl alcohol and 0.9 % sugar.

Sakurai, Joji. 1858–1939. A Japanese chemist noted for organic research and teaching.

S.-Landsberger apparatus. A device for rapidly determining approximate molecular weights by the vapor pressure method.

sakuranin. $C_{22}H_{24}O_{10}$ = 448.19. A glucoside, m.212, from sakura, the Japanese cherry tree.

sal. The Latin for salt. **s. acetosella.** Potassium binoxalate. **s. aeratus.** Potassium bicarbonate. **s. alembroth.** Ammoniated mercury. **s. amarum.** Magnesium sulfate. **s. ammoniac.** Ammonium chloride. **s. carolinum facticum.** An artificial Carlsbad salt. **s. communis.** Sodium chloride. **s. de duobus.** Potassium sulfate. **s. enixum.** Potassium bisulfate. **s. epsom.** Magnesium sulfate. **s. ethyl.** Ethyl salicylate. **s. fossile.** Sodium chloride. **s. glauberi.** Sodium sulfate. **s. marinum.** Sodium chloride. **s. mirabile.** Sodium sulfate. **s. perlatum.** Sodium phosphate. **s. prunella.** A concentrated and refined saltpeter, made by fusing to remove moisture and then molding into a cake; used for meat curing. **s. rupium.** Rock salt. **s. sapientiae.** Mercuric ammonium chloride. **s. sedatirum.** Borax. **s. soda.** Sodium carbonate. **s. tartari.** Potassium carbonate. **s. volatile.** Ammonium carbonate.

salacetol. $C_{10}H_{10}O_4$ = 194.1. Salantol, salicylacetol, acetosalicylic ester, $C_6H_4(OH)COOCH_2COMe$. Colorless or pink needles, m.71, slightly soluble in water or alcohol; used medicinally as a substitute for salol.

salamandaridine. An alkaloid obtained from the poisonous skin secretion of the salamander species. Cf. *samandaridine.*

salamander. A truncated cone of plumbago, by which a crucible can be heated uniformly.

salamanderine. $C_{34}H_{60}O_5N_2$ = 576.5. A poisonous alkaloid derived from the skin of the salamander species. Cf. *samandarine.*

salamide. Salicylamide.

salantol. Salacetol.

salazolon. Salipyrine.

saldanine. An alkaloid from *Datura arborea*, a Mexican shrub. It is a local anesthetic.

salep. The tubers of *Orchis mascula, O. latifolia* and other Orchidaceae, used as demulcents and as a highly-nutritive food. Cf. *arrowroot.*

saleratus. Potassium bicarbonate (sal aeratus).

salethyl. Ethylsalicylate.

salhypnone. $C_{15}H_{12}O_4$ = 256.1. Benzoylmethylsalicylate, $C_6H_4(OCOPh)COOCH_3$. Colorless needles, m.113, insoluble in water, soluble in alcohol or ether; used as a mild antiseptic.

salic. Containing alumina. **s. minerals.** Those igneous rocks which contain more alumina than iron. Cf. *alferric.*

salicin. $C_{13}H_{18}O_7$ = 286.2. Saligenin. A glucoside from the bark of *Populus tremula* (American aspen), *Spiraea* species and *Salix* species (willows). Colorless leaflets, d.1.43, m.201 (decomp.); soluble in water or alcohol, insoluble in ether or chloroform. It hydrolyzes to glucose and salicyl alcohol; the latter is oxidized to salicylic acid:

$$(OH)_4C_6H_7.OO.C_6H_4CH_2OH = C_6H_4(OH)CH_2OH + C_6H_4(OH)COOH$$

Used as a reagent for nitric acid, and medicinally, as an antipyretic and ton,c. **benzoyl-**Populin.

salicoside. Salicin.

salicyl. The monovalent radical, $HO.C_6H_4$—i derived from salicylic acid. Cf. *salicylyl.*

salicylacetol. Salacetol.

salicylal. (1) Salicylaldehyde. (2) The bivalent radical, $C_6H_4(OH)CH{=}$(1.2-position).

salicylalcohol. $C_7H_8O_2$ = 124.1. Saligenin, saligenol, o-hydroxybenzyl alcohol, $C_6H_4(OH)\text{-}CH_2OH$. A hydrolysis product of salicin. Rhombic, colorless needles, d.1.61, m.86, b.100, soluble in water, alcohol or ether; used medicinally as an antipyretic. ***p*-amino-** Edinol.

salicylaldehyde. $C_7H_6O_2$ = 122.1. Salicylicaldehyde, salicylal, o-hydroxybenzaldehyde, $C_6H_4(OH)CHO$. A colorless, aromatic liquid, d.1.167, m. −7, b.196.5, used in perfumery; slightly soluble in water, soluble in alcohol or ether. It is a reagent for acetone. **methoxy-** Vanillin. **s. glucose.** Helicin.

salicylamide. $C_7H_7O_2N$ = 137.1. Salamide, o-hydroxybenzamide, $C_6H_4(OH)CONH_2$. Colorless transparent leaflets, m.138, b.270, slightly soluble in water, soluble in alcohol or ether; used medicinally as an antipyretic and analgesic. **salicylyl-** Disalicylamide.

salicylanilide. Salifebrin. A compound of salicylic acid and acetanilide. A colorless powder, insoluble in water, soluble in alcohol; used medicinally as an antipyretic.

salicylase. An enzyme that oxidizes salicylaldehyde to salicylic acid.

salicylate. A salt of salicylic acid $C_6H_4(OH)\text{-}COO.M$; M is a monovalent metal.

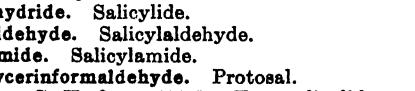
salicylic acid. $C_7H_6O_3$ = 138.1. o-Hydroxybenzoic acid, $C_6H_4(OH)COOH$. Colorless needles, m.158, slightly soluble in water, soluble in alcohol or ether. Used as a reagent for ferric salts, nitrites, formaldehyde and other organic substances, as a preservative for foods, and as a bactericide, antifermentative and antirheumatic agent. **acetamidoethyl-** Benzacetin (1). **acetamidomethyl-** Benzacetin (2). **acetyl-** See *acetyl*. **o-amino-** $C_7H_7O_3N$ = 153.1. 1-Amino-2-hydroxy-3-benzoic acid, $C_6H_3(NH_2)OH.CO\text{-}OH$. A gray, amorphous, odorless powder, insoluble in water, alcohol or ether; used medicinally as an antirheumatic. **arsino-** See *arsino*. **homo-** Cresotic acid. ***5*-hydroxy-** Gentisic acid. **methoxymethyl-** Everninic acid. **methyl-** Cresotic acid. **methylcarboxyl-** Spiracin. **nitro-** Nitrosalicylic acid. **phenyl-** q.v. **phenylo-** q.v. **propionyl-** q.v. **salicylo-** Diplosal. **sulfo-** q.v.
s. anhydride. Salicylide.

salicylic aldehyde. Salicylaldehyde.

salicylic amide. Salicylamide.

salicylicglycerinformaldehyde. Protosal.

salicylide. $C_{28}H_{16}O_8$ = 480.2. Tetrasalicylide, an anhydride of salicylic acid:



Colorless crystals, m.260.

salicylol. $C_7H_8O_2$ = 124.06. A colorless fragrant liquid from various plants; used in perfumery.

salicylonitrile. C_7H_5ON = 119.1. o-Hydroxybenzylnitrile, $C_6H_4(OH)CN$. Colorless crystals, m.98; soluble in water.

salicylosalicylic acid. Diplosal.

salicyl-p-phenetidine. Saliphen.

salicylquinine. Saloquinine.

salicylresorcinol. $C_{13}H_{10}O_4$ = 230.1. The ketone of salicylic acid and resorcinol, trihydroxybenzophenone, $C_6H_4(OH).CO.C_6H_3(OH)_2$ (1.2.4). Colorless leaflets, slightly soluble in water, soluble in alcohol or ether; used as an antipyretic and antiseptic.

salicylyl. The monovalent radical, $C_6H_4(OH)\text{-}CO\text{—}$ (1.2 position). Cf. *salicyl*.

salifebrin. Salicylanilide.

saliformine. $C_{13}H_{18}O_3N_4$ = 278.16. Urotropine-salicylate, hexamethylenesalicylate, forminesalicylate, $C_6H_{12}N_4.C_6H_4(OH)COOH$. A white crystalline powder, soluble in water or alcohol; used medicinally as an antiseptic and solvent for uric acid.

salify. To form a salt.

saligallol. Pyrogallolsalicylate. A resinous solid, used externally in a solution in acetone.

saligenin. (1) Salicyl alcohol. (2) Salicin. **homo-** Methyl hydroxy benzene.

saligenol. Salicyl alcohol.

salimenthol. $C_{17}H_{24}O_3$ = 276.2. Samol, mentholsalicylate, $C_6H_4(OH)COOC_{10}H_{19}$. A colorless liquid, insoluble in water, soluble in alcohol; used medicinally as a local anodyne and analgesic.

salimeter. A hydrometer used to determine the density of salt solutions.

salinaphthol. Betol.

saline. (1) Salt-like in character. (2) A salt-spring or well. (3) The taste of common salt. (4) Containing sodium chloride. **normal-** A sterilised 0.9 % solution of common salt in water. **s. solution.** A 0.6 % solution of sodium chloride, used as a physiological salt solution.

salines. Salt springs or salt lands.

salinigrin. $C_{13}H_{16}O_7$ = 284.2. A glucoside from the bark of *Salix nigra*, willow; probably identical with piceoside.

salinity. (1) A comparative indication of the concentration of salts in natural waters; as sea water. (2) The number of grams of salt in 1 kg. seawater, when bromides and iodides have been converted to chlorides, the carbonates to oxides, all organic matter destroyed and the mass heated to 450°C for 72 hours. It is related to chlorinity by: S = 0.03 + 1.805 Cl.

salinimeter. An hydrometer for determining the salt content of brine or sea water. Cf. *salimeter*.

salinometer. An instrument in which the electrical conductivity of a water is used to control its acidity, alkalinity or salt content. Cf. *salinimeter*.

saliphen. $C_{15}H_{15}O_3N$ = 257.2. Saliphenin, salicyl-p-phenetidine, $C_6H_4(OEt)NHC_6H_4(OH)CO$. A colorless crystalline powder, m.140, insoluble in water, soluble in alcohol, acetone or ether; used medicinally as an antifebrilic and antipyretic.

saliphenin. Saliphen.

salipyrine. $C_{18}H_{18}O_4N_2$ = 326.2. Antipyrine-salicylate, salpyrin, pyrosal, tyrosal, salazolon, $C_{11}H_{12}ON_2.C_6H_4(OH)COOH$. A coarse white crystalline powder, or hexagonal crystals, m.91, slightly soluble in cold water, soluble in hot water, alcohol or ether, decomp. by acids or alkalis; used medicinally as an antipyretic and antiseptic.

saliretin. $C_{14}H_{14}O_3$ = 230.2. A yellowish resinous substance from salicin.

saliseparin. Smilacin.

salit. Borneol salicylate.

salitannol. $C_{14}H_{10}O_7$ = 290.1. A condensation-product of salicylic acid and gallic acid. A white amorphous powder, insoluble in water or ether, soluble in alcohol; used medicinally as an antiseptic.

saliter, salitre. Sodium nitrate.

salithymol. $C_{17}H_{18}O_3$ = 270.2. Thymolsalicylate, $C_6H_4(OH)COOC_{10}H_{13}$. A colorless, crystalline powder, insoluble in water and soluble in alcohol; used medicinally as an antiseptic.

saliva. The clear, alkaline secretion of the glands in the mouth. It contains digestive enzymes, such as ptyalin and certain salts (potassium thiocyanate) besides proteins (albumin, globulin). The chemical composition is greatly modified by food, and some of the constituents appearing after improper diet, may cause the formation of "tartar" on the teeth. Cf. *sputum*.

salivin. Ptyalin.

Salix. The willows, a genus of trees and shrubs, Salicaceae, whose bark is a source of salicin. **S. alba.** The European or white willow. Its bark is used as a tonic. **S. fragilis.** The brittle willow, snap willow. Its bark is used as an astringent and febrifuge. **S. nigra.** The pussy willow, American-, black-, or swamp willow. Its bark is used medicinally as a tonic, antipyretic and sedative.

Salkowski's solution. A solution of phosphotungstic acid; used to test for albumose in urine.

Salle index. See *germicide*.

salmak. Ammonium chloride.

salmiac. Ammonium chloride.

salmine. $C_{30}H_{57}O_6N_{14}$ = 709.9. A protamine derived from the spermatozoa of the salmon.

salochinine. Saloquinine.

salocoll. $C_{17}H_{21}O_5N$ = 331.2. Phenocollsalicylate $C_6H_4(OC_2H_6)NHCOCH_2.CH_2C_7H_6O_3$. Colorless small needles, soluble in hot water; used medicinally as an antirheumatic.

salol. Phenylsalicylate. **acetamido-** Salophen. **acetyl-** Spiroform. **acetylamino-** q.v. **chloro-** q.v. **nitro-** q.v. **tribrom-** Cordol.

salolphosphinic acid. Salvosal.

salophen. $C_{15}H_{13}O_4N$ = 271.1. Acetyl-p-amidosalol, acetamidosalol, acetyl-p-aminophenyl salicylate, [phenetsal, $C_6H_4(OH)COOC_6H_4NH(COCH_3)$. Small, white scales, m.188, soluble in hot water, alcohol or ether; used medicinally as an intestinal antiseptic and antipyretic.

saloquinine. $C_{27}H_{28}O_4N_2$ = 444.24. Salicylquinine, salochinine, quinine salicylate, $C_6H_4(OH)COOC_{20}H_{23}ON_2$. A colorless crystalline powder, m.130, soluble in alcohol or ether, almost insoluble in water; used medicinally.

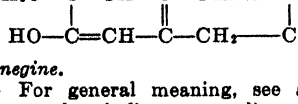
salosalicylide. Disalicylide.

salpyrine. Salipyrine.

salseparin. Smilacin.

salseparisin. Parillin.

salsoline. $C_{11}H_{15}NO_2$ = 193.12. An alkaloid from *Salsola Richteri*, a Cactaceae.



Cf. *carnegine*.

salt. (1) For general meaning, see *salts*. (2) Common salt, halite or sodium chloride. **bakers'-** Ammonium carbonate. **bay-** Sodium chloride from sea water. **bitter-** Magnesium sulfate. **Carlsbad-** A mixture of sodium and potassium sulfate, sodium bicarbonate and sodium chloride. **common-** Sodium chloride. **diuretic-** Potassium acetate. **Epsom-** Magnesium sulfate. **Everitt's-** Potassium ferricyanide. **Glauber's-** Sodium sulfate. **Homberg's-** Boric acid. **iodized-** Sodium chloride, with a trace of iodide, for table purposes. **microcosmic-** Sodium ammonium acid phosphate, $NaNH_4HPO_4.5H_2O$. **Mohr's-** Ferrous ammonium sulfate. **Monsel's-** Ferric subsulfate. **peptic-** A mixture of sodium chloride and pepsin. **phosphor-** Microcosmic s. **Plimmer's-** Sodium antimony tartrate. **Preston's-** An aromatized ammonium carbonate used as smelling s. **Rochelle-** Potassium sodium tartrate. **rock-** Sodium chloride. **Schlippe's-** Sodium thioantimonate. **sea-** Sodium chloride from sea water. **Seignette's-** Potassium sodium tartrate. **Sorrel-** Potassium bioxalate. **spirits of-** Commercial hydrochloric acid. **Stassfurt-** See *Stassfurt s.* **sweet-** Sodium chlorite. **table-** Sodium chloride.

s. cake. Impure sodium sulfate; a by-product of the Leblanc soda process. **s. deposits.** Saline residues. The accumulation of salts resulting from the evaporation of natural waters such as occurs at Stassfurt (q.v.) and in the desert. They consist chiefly of the carbonates, chlorides, sulfates, and borates of sodium, potassium, calcium and magnesium. **s. glaze.** See *glaze*. **s. hydrates.** The solid phases which consist of salt and water; hence any crystal with one or more molecules of water of crystallization. **s. ice.** Frozen brine, m. −6°F. or −21°C. A 2.5 lb. euteotic mixture has the same refrigerating effect as 1 lb. solid carbon dioxide (dry ice). **s. of amber.** Succinic acid. **s. of lemon.** Potassium binoxalate. **s. of phosphorus.** Sodium ammonium acid phosphate. **s. of sorrel.** Potassium bioxalate. **s. of tartar.** Acid potassium tartrate. **s. of tin.** Stannous chloride. **s. of wormwood.** Potassium carbonate. **s. of vitriol.** Zinc sulfate. **s. peter.** Potassium nitrate. **s. solution.** Saline solution.

salting. Treating with salt; usually NaCl. **s. in.** The mutual increase in the solubilities of an electrolyte and an organic compound when added to the same solvent; hence more of each substance dissolves when both are present. The reverse is, **s. out.** (1) The precipitation of proteins by the addition of salts. (2) In general, the separation of a substance from its solution by adding soluble salts.

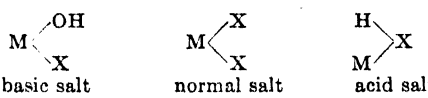
saltpeter, saltpetre. Potassium nitrate. **Chile-** Sodium nitrate. **German-** Ammonium nitrate. **Norge-** or **Norway-** Calcium nitrate.

salts. A group of substances that result from the reaction between acids and bases; a compound of a metal or positive radical and a non-metal or negative radical:

$$\underset{\text{base}}{M.OH} + \underset{\text{acid}}{H.X} = \underset{\text{salt}}{M.X} + \underset{\text{water}}{H_2O}$$

acid- A compound of a base and acid radical that contains unreplaced hydrogen atoms from the acid; as, $NaHSO_4$, or NaH_2PO_4. **acidulous-** A salt that has an acid reaction to litmus or similar indicators. **alkaline-** A salt that has a basic reaction to litmus or similar indicators. **amphoteric-** A salt that has both acid and basic reactions. **basic-** A compound of a base and acid radical that contains unreplaced hydroxyl radicals of the base; as $Bi(OH)Cl_2$. **binary-** A compound of two bases and one acid radical; as, $NaKSO_4$. **complex-** Salts which are made up of more than one simple acid or metallic radical, but which ionize in solution into only two types of ions. Thus potassium ferrocyanide: $K_4Fe(CN)_6 \rightleftharpoons 4K^+ + Fe(CN)_6^{----}$ Cf. *Werner's theory*. **double-** A molecular

combination of two salts; as, in alums, M_2SO_4.$M_2(SO_4)_3.24H_2O$. They crystallize together from solution, but when dissolved they decompose into their constituent salts, (cf. *complex salts*). **ethereal-** An ester, q.v. **mixed-** Salts of two or more metals; as, $NaKSO_4$. **neutral-** A salt whose solution has a neutral reaction, as potassium chloride. **normal-** A compound of a base and acid that have completely neutralized each other:



basic salt normal salt acid salt

The reaction in water may be neutral, alkaline, acid, or amphoteric. **oxy-** A compound of a base with an oxy-acid radical. **triple-** A salt containing three metals; as, triple chloride.

salubrol. $C_{23}H_{24}O_2N_4Br_4$ = 708.4. Methylene-diantipyrine tetrabromide, tetrabrommethylene-diantipyrine. An orange-yellow powder, m.155; insoluble in water, soluble in alcohol. Used medicinally as a harmless dusting powder.

salufer. Sodium silicofluoride.

salumin. Aluminum salicylate.

salvarsan. A German brand of *arsphenamine.*

salve. See *ointment.*

salvia. Sage, save. The dried leaves of *Salvia officinalis*, a Labiatae. It contains an essential oil, resin, tannin, and bitter principles; used as a spice, and medicinally as the fluid extract. Cf. *sclareol.* **s. oil.** Sage oil.

salvianin. Monardein. The coloring matter from *Salvia coccinea.*

salviol. $C_{10}H_{16}O$ = 152.1. Thujone. An eleoptene from the essential oil of *Salvia* species. A colorless liquid, b.201, insoluble in water, soluble in alcohol.

salvosal lithia. Lithium salol-o-phosphite. **s. potash.** Potassium salol-o-phosphite.

sama condition. Sama-zustand. A temperature-difference in complete equilibrium, that is, no thermal flow; as, gases at low pressures in a gravitational field. Stellar nebulosities with a temperature gradient of $13' \times 10^{-6}$ degree/cm. at a pressure of 10^{-4} mm. are in equilibrium.

samaderin. $C_{29}H_{34}O_{11}$ = 558.2. A bitter principle from the bark and fruit of *Samadera indica.*

samandaridine. $C_{20}H_{31}ON$ = 301.3. An alkaloid from *Salamandra maculosa*, a salamander. Cf. *salamandaridine.*

samandarine. $C_{52}H_{80}O_2N_4$ = 792.8. An alkaloid from the skin secretion of *Salamandra* species (salamanders). Cf. *salamanderine.*

samandatrine. $C_{21}H_{37}O_2N_2$ = 365.4. An alkaloid from the secretions of *Salamandra atra*, an Alpine salamander.

samaric. Pertaining to trivalent samarium. **s. bromide.** $SmBr_3.6H_2O$ = 498.27. Green crystals, d.2.971; soluble in water. **s. chloride.** (*anhydrous*) $SmCl_3$ = 256.80. Greenish-yellow crystals, d.4.46, m.686; soluble in water or alcohol. (*hydrate*) $SmCl_3.6H_2O$ = 364.89. Green, trigonal crystals, d.2.383, soluble in water. **s. hydroxide.** $Sm(OH)_3$ = 201.45. A colorless powder insoluble in water. **s. nitrate.** $Sm(NO_3)_3.6H_2O$ = 444.55. Pale yellow, triclinic prisms, d.2.375, soluble in water. **s. oxalate.** $Sm_2(C_2O_4)_3.10H_2O$ = 745.02. Colorless crystals, insoluble in water. **s. sulfate.** $Sm_2(SO_4)_3.8H_2O$ = 733.18. Yellow, monoclinic crystals, d.2.93, slightly soluble in water. **s. sulfide.** Sm_2S_3 = 396.8. A yellowish powder, d.5.729, m.1900.

samarium. Sm (Sa) = 150.43. A rare earth metal and element, atomic number 62, discovered by Boisbaudran (1879). A grayish-white metal, d.7.7, m.1350; soluble in acids. Samarium has a valency of two or three, and forms green and pink colored salts. Cf. *samaric, samarous.* **s. oxide.** Sm_2O_3 = 348.8. A white powder; insoluble in water, soluble in acids.

samarous. Bivalent samarium. **s. chloride.** $SmCl_2$ = 221.33. Red-brown needles, m.740; soluble in water with the formation of hydrogen. **s. sulfate.** $SmSO_4$ = 246.4. An orange-colored powder, insoluble in water.

samarskite. A lustrous, velvet-black, native columbate and tantalate of uranium, cerium and yttrium metals, which includes samarium.

sama-zustand. Sama condition.

sambucus. Elder flowers. The dried flowers of *Sambucus* species, elder family; used medicinally as the fluid extract. **s. juice.** Elderberry juice. An extract from the fruit of *Sambucus* species; used medicinally as a diuretic and alterant.

sambunigrin. $C_{14}H_{17}NO_6$ = 295.14. A glucoside, m.152, from the leaves of the elder, *Sambucus nigra*, which hydrolyses to glucose and *l*-mandelonitrile.

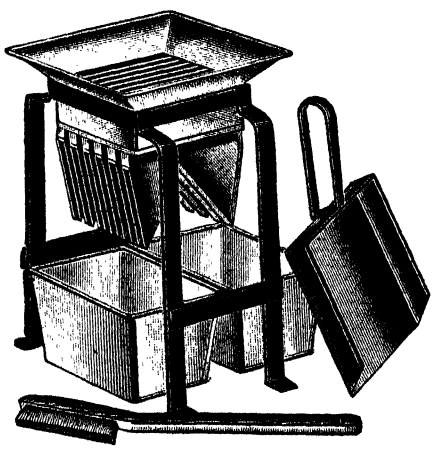
samin. $C_{13}H_{14}O_5$ = 250.1. A hydrolysis product of sesamolin. Colorless needles, m.103, soluble in chloroform.

samneh. Rendered butterfat from Palestine.

samol. Salimenthol.

samphire. The common name usually applied to *Crithmum maritimium* (Umbelliferae), an English herbal. Its fleshy leaves are used as a pickle.

sample. A representative portion of a substance, systematically taken for the purpose of judging its quality by analysis.



Sampler.

sampler. Riffles. A device for splitting automatically aggregates of crushed ore, coal, cement, or other materials preparatory for analysis. See illustration. or

sampling. Selecting something to be tested approved. The taking of a sample.

sand. Grains or particles of disintegrated siliceous rock, chiefly of quartz. **Calais-** An extremely fine sand found near Calais; used to polish platinum ware. **silver-** A fine sand, washed

with hot acids and water and used for grinding up with substances prior to their extraction.

s. bath. A vessel filled with sand in which vessels or instruments are heated in order to obtain a uniform distribution of heat. It is used similarly to the water-bath, but for higher temperatures. **s. blast.** A stream of sand projected by compressed air or steam, and used as an abrasive, metal cutter, or for frosting glass. **s. paper.** An abrasive made by coating stout paper or thin cloth with glue, and dusting fine sand on it. It is intermediate in effect between glass and emery paper.

sandalwood. White sandalwood, santalum, white sanders. The heart-wood of *Santalum album*, a Santalaceae. Used medicinally as the fluid extract, as a diuretic and antiseptic; and as a source of sandalwood oil and incense. **red-** Red sanders, ruby wood. The heartwood of *Pterocarpus santalinus*, a Leguminosae; used as a coloring material. See *santalin*, *santol*, *pterocarpin*. **yellow-** Yellow sanders. A yellow variety of sandalwood; used as a coloring material.

s. oil. *East Indian-* The essential oil of white sandalwood, d.970–0.985, containing santalol, santalin and its esters. *West Indian-* The essential oil from *Amyris balsamifera*, a Rutaceae.

sandarac(h). Gum juniper, sandarach. The resinous substance which exudes from *Callitris quadrivalvis* (*Thuja articulata*), a pine of N.W. Africa.

sandaracolic acid. $C_{44}H_{64}O_4(OH)COOH$ = 718.6. A resinous acid from sandarac.

sandix. Orange-red, orange mineral. A native minium, or lead oxide of a lighter color than usual; used as a pigment.

Sandmeyer's reaction. The replacement of an amino group by a halogen, or the transformation of diazocompounds into halogen compounds by treatment with cuprous halogen salts:

$$Ph.N{:}N\,Cl + Cu_2Cl_2 = PhCl + N_2 + Cu_2Cl_2$$

sandoptal. $C_{11}H_{16}N_2O_3$ = 224.2. 5-Allyl-5-isobutyl barbituric acid. Colorless crystals, soluble in water; used as a hypnotic.

sandstone. A sedimentary rock, which consists of coherent grains of sand.

sang de boeuf. A red pottery glaze produced by the reduction of copper oxide.

sanguinaria. (1) Blood root, red root, tellerwort. The dried rhizomes and roots of *Sanguinaria canadensis*, a Papaveraceae. It contains the alkaloids, sanguinarine, homochelidonine, protopine and chelerythrine (see *opium alkaloids*); used medicinally as an emetic and expectorant. (2) A dark green bloodstone with red spots. (3) Hematite.

sanguinarine. $C_{20}H_{15}O_4N$ = 333.2. An alkaloid from the root of *Sanguinaria canadensis* and *Stylophorum diphyllum*. White needles, m.213, insoluble in water, soluble in alcohol or acids with red color. **s. nitrate.** $C_{20}H_{15}O_4N.HNO_3$ = 396.2. Orange-yellow crystals, soluble in water or alcohol; used as a tonic and cardiac stimulant. **s. sulfate.** $(C_{20}H_{15}O_4N)_2H_2SO_4$ = 764.4. An orange-red crystalline powder, soluble in water or alcohol.

sanguis draconis. Dragon's blood.

sanicle. Sanicula.

sanicula. Wood march, sanicle. The herb and root of *Sanicula europaea*, an umbelliferous plant. It contains tannin and is used as an astringent.

sanidine. A glassy form of orthoclase.

sanocrysin. A preparation containing 37.4 % gold; used in the treatment of pulmonary tuberculosis.

sanoform. $C_8H_6O_2I_2$ = 404.0. Methyldiiodosalicylate. $C_6H_2I_2(OH)COOMe$. A colorless crystalline powder, m.110, insoluble in water, soluble in alcohol or ether; used medicinally as a dusting powder.

santal. Santalenic acid. **oil of-** Sandalwood oil.

santalal. $C_{15}H_{24}O$ = 220.2. An aldehyde, $C_{14}H_{23}.CHO$, in sandalwood oil.

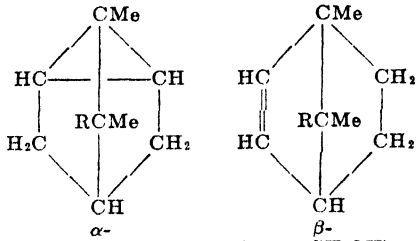
santalene. $C_{15}H_{24}$ = 204.19. A terpene occurring in three forms; *α-* d.0.913, b.252. *β-* d.-0.894, b.$_{7mm}$126. *γ-* d.0.936, b.$_{10mm}$120.

santalenic acid. $C_{15}H_{24}O_5$ = 274.1. Santalic acid. Santalin. The coloring material of red sandalwood. A red powder, m.104, insoluble in water, soluble in alcohol or ether.

santalic acid. Santalenic acid.

santalin. Santalenic acid.

santalol. (1) $C_{15}H_{24}O$ = 220.2. A terpene from sandalwood. A colorless liquid. (*α-*) Arheol.



α- *β-*

(**R is** $—CH_2.CH_2.CH{:}CHMe.CH_2OH$).

d.0.979, b.300. (*β-*) d.0.973, b.309. Used in the treatment of urethritis. (2) Santyl. **s. methyl ester.** Thyresol.

santalum. Sandalwood.

santalyl. The radical $C_{15}H_{23}$—. **s. carbonate.** Carbosant. **s. chloride.** $C_{15}H_{23}Cl$ = 238.64. A colorless liquid, d.1.040, b.$_{10mm}$155. **s. salicylate.** Santyl.

santene. C_9H_{14} = 122.11. A liquid hydrocarbon, d.0.869, b.142.

santenol. $C_9H_{16}O$ = 140.2. *1.4*-Methylene-*2.2*-dimethylcyclohexene-*2*. A colorless crystalline powder, d.0.987, m.98, b.196.

santobrite. C_6Cl_5ONa = 288.3. Sodium pentachlorophenate. A preservative.

santochlor. *p*-Dichlorobenzene.

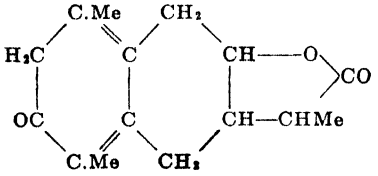
santol. $C_8H_6O_2$ = 150.0. A colorless crystalline substance from red sandalwood.

santomerse. An alkylated aryl sulfonate preparation having surface-active properties.

santonic acid. (1) $C_{15}H_{18}O_3$ = 302.14. An acid from santonica, m.171, b.$_{11mm}$285. (2) $C_{14}H_{20}O_5$ and other formulas. **apo-** $C_{14}H_{20}O_3$ = 236.14. White crystals, m.164. **hydroxy-** $C_{14}H_{20}O_6$ = 284.14. Colorless crystals, decomp. 215. **s. lactone.** Santonin.

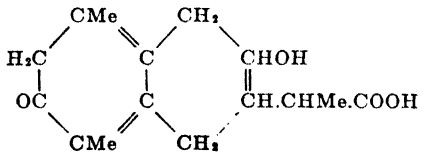
santonica. Levant worm-seed, cina, xantholine, semen cinae. The dried flower heads of *Artemisia pauciflora*, a Compositae. It contains santonin, artemisin, essential oils, resins and gums; used medicinally as a vermifuge and diuretic. Cf. *cinaebene*.

santonin. $C_{15}H_{18}O_3$ = 246.22. The lactone of santoninic acid. A neutral, non-glucosidal bitter principle from santonica. Colorless, odor-



less shining leaflets, d.1.187, m.170 (sublimes and decomp.); insoluble in water, soluble in alcohol, ether or chloroform. Used medicinally as an anthelmintic. Cf. *myosin*. **oxy-Artemisin.**

santoninic acid. $C_{15}H_{20}O_4$ = 264.2.



Santonic acid. Colorless crystals, d.1.251, m.179.

santoninoxime. $C_{15}H_{18}O_2(NOH)$ = 261.2. The oxime of santonin. White, silky needles, m.217, slightly soluble in water; used as an anthelmintic.

santyl. $C_{22}H_{28}O_3$ = 340.3. Santalyl salicylate, santalol, $C_6H_4(OH)COOC_{15}H_{23}$. A yellowish oily liquid, d.1.07, b.$_{22mm}$126, insoluble in water; used medicinally as a urinary antiseptic. **s. methylester.** Thyresol.

s.ap. An abbreviation for apothecaries' scruple = ℈.

sap. (1) The liquid juices of a plant, especially the circulating liquids which assist growth. (2) The surface portions of a rock that are softened by weathering.

sapamine. A higher fatty-acid N-carboxyl ester of symmetrically-substituted ethylenediamines; as, diethylamino-ethyloleamide.

sapine. $C_5H_{14}N_2$ = 102.2. A non-toxic isomer of cadaverine.

Sapindales. An order of plants which comprises the families Anacardiaceae Aquifoliaceae, Aceraceae, and Sapindaceae.

sapiphores. The groups or radicals in an organic compound which produce a sweet or bitter taste. The sweet taste comes from a suitable combination of factors in the compound; the bitter from an unsuitable one. Cf. *glucophore*.

sapo. A soap prepared from olive oil and sodium hydroxide.

sapogenin. $C_{14}H_{22}O_2$ = 222.2. Sapogenol. A decomposition-product of saponin. Colorless needles, m.257; insoluble in water, soluble in alcohol or ether.

sapogenol. Sapogenin.

saponaria. Soaproot, soapwort, bruisewort. The herb and root of *S. officinalis*, a Caryophyllaceae which contains saponin and sapotoxin; used medicinally.

saponarin. $C_{21}H_{24}O_{12}$ = 468.19. A glucoside, m.232, from saponaria.

saponetin. $C_{40}H_{66}O_{15}$ = 786.5. A crystalline principle from saponaria.

saponification. The conversion of an ester into an alcohol and acid salt; in particular, that of fats into soaps by means of alkalis:

$$(R.COO)_3G + 3NaOH = 3R.COONa + G(OH)_3$$
fat soap glycerol

The hydrolysis of a glycerol-ester (fat) to a free alcohol (glycerol) and ester salt (soap). **s. equivalent.** The quantity of fat (in grams) that is saponified by one liter of normal alkali:

Sap. Equ. = 56108/Sap. Number.

s. number. The quantity of potassium hydroxide (in milligrams) necessary to saponify 1 gm of a fat or oil. **s. value.** S. number.

saponifier. The alkali used to hydrolyze fats or oils.

saponify. To hydrolyze an ester to form a soap.

saponin. $C_{32}H_{54}O_{18}$ = 726.5. A glucoside from soapwort, quillaia and other plants. A white amorphous powder, soluble in water; the solution foams like soap when shaken. Used medicinally and technically as a foam producer; it has toxic properties, and is also used as an antiseptic. **sasanqua s.** $C_{78}H_{118}O_{22}.3H_2O$. A glucoside from the seeds of *Camelia sasanqua*, a Theaceae, decomp. 222; it hydrolyzes to pentose, and 3 mols. of galactose and prosapogenin.

saponins. A group of amorphous glycosides that produce foaming solutions. They occur in *Saponaria* species, Hippocastanaceae, and other species of plants.

saponite. A native, hydrous silicate of magnesium and aluminum.

sapota. The dried fruit of the bully tree, *Achras sapota*, a Sapotaceae of South America. It contains tannin; used medicinally as an antiperiodic. Cf. *chicle*.

Sapotaceae. A natural order of tropical shrubs and trees, many of which bear edible berries, and are sources of saponin.

Mimuseps globosa....	..... balata, chicle.
Bumelia retusa.....	..... balata wood

Cf. *butternut, illipe, maclayine, sapotin*.

sapotalene. $C_{13}H_{14}$ = 170.1. *1.2.7*-Trimethylnaphthalene. Colorless crystals, insoluble in water.

sapotin. $C_{29}H_{52}O_{20}$ = 720.5. A glucoside from the seeds of *Achras* or *Sapota sapotilla;* colorless crystals, m.240.

sapotinetin. $C_{17}H_{32}O_{10}$ = 396.3. A decomposition product of sapotin.

sapotoxin. $C_{17}H_{26}O_{10}$ = 390.3. A toxin from the bark of quillaja, soap bark.

sappan wood. Sibucao. The wood of *Caesalpinia sappan*, a Philippine Leguminosae; used as a dye.

sapphire. A native, clear, blue corundum, Al_2O_3, used as a gem. **Brazilian-** Tourmaline. **water-** Iolite.

saprine. $C_5H_{14}N_2$ = 102.2. A ptomaine from decaying meat.

sapropelic coal. A coal which contains microscopic oil-bearing algae.

sapropelitic. Resembling coal or asphalt.

saprophyte. A vegetable microorganism living in air, soil or water, which feeds on dead or decaying animals or plants. It differs from parasites, which feed upon living organisms.

saprophytic. Feeding on dead vegetable or animal organisms.

saran. Trade name for a polyvinylidene chloride; used to flameproof fabrics.

Sarcina. A genus of *Coccaceae* (Schizomycetes) which forms bale-like packs. See *bacteria* (figure).

sarcine. Hypoxanthine.

sarcocol. A gum resin from *Penaea sarcocolla* an African Penaeaceae.

sarcocollin. $C_{13}H_{23}O_6$ = 275.2. A constituent of sarcocol.

sarcolactate. A salt of sarcolactic acid, which contains the monovalent MeCHOHCOO— radical.

sarcolactic acid. $C_3H_6O_3$ = 90.1. p-Lactic acid, Me.CHOH.COOH. A colorless liquid, soluble in water, alcohol or ether. See *lactic acid.*

sarcolite. An aluminum silicate, which contains lime and sodium, belonging to the melilite group.

sarcosine. $C_3H_7O_2N$ = 89.08. Methylglycine, sarkosine, methylaminoacetic acid, MeNH.CH_2.COOH. Colorless, rhombic crystals, m.-210, soluble in water or alcohol; used medicinally as an antirheumatic. **dimethyl-** Betaine.

sard. A brown variety of sardonyx.

sardine oil. The fatty oil expressed from sardines, and used as leather dressing.

sardinianite. $PbSO_4$. A monoclinic variety of anglesite.

sardonyx. A variety of chalcedony; a reddish-brown slightly translucent stone. Used as a semiprecious stone, as it takes a high polish. Cf. *sard.*

sarkine. Hypoxanthine.

sarkokaulin. $C_{13}H_{24}O_2$ = 212.19. An alcohol, m.78, from the wax of the candle bush, *Sarcocaulon burmani*, a Leguminosae of So. Africa.

sarkosine. Sarcosine.

sarracenine. An alkaloid from the roots of *Sarracenia* species, fly-trap or pitcher plant; white needles, soluble in alcohol or ether.

sarsaparilla. Radix sarsae. The dried root of *Smilax medica* and other species, Liliaceae. It contains several glucosides, (smilacin, parillin) resin, saponins, and essential oils; used medicinally as a tonic. **American-, false-** The root of *Aralia nudicaulus*, an Araliaceae. **Indian-** The root of *Hemidesmus indicus*, an Asclepiadaceae. **Jamaica-** Sarsaparilla.

sarsasaponin. A glucoside from sarsaparilla or smilax, used as an emetic and expectorant.

sassanqua. See *saponin.*

sassafras. The dried bark of the root of *Sassafras variifolium*, a lauraceous tree of North America. It contains an essential oil, resin, tannin and wax; used as the fluid extract, as a carminative. **Australian-** Atherospermine.

s. nuts. Pichurim beans. **s. oil.** Oleum sassafras. The volatile oil distilled from the root of s. (*bark*). An essential oil from the bark of *S. officinalis*, d.1.065–1.095, containing safrole, eugenol, camphor, pinene and phellandrene. **s. pith.** The dried pith of sassafras species. White, spongy, cylindrical pieces, used as mucilage for inflammations of the air and digestive passages.

sassa gum. A red gum from *Albizzia fastigiata*, a leguminous tree of Abyssinia.

sassoline. Sassolite.

sassolite. $B(OH)_3$. Sassoline. A native boric acid; occurs in triclinic, lustrous scales at the fumaroles.

sassy bark. Mancona bark, casca bark, doom bark. The bark of *Erythrofloeum guinense*, a Leguminosae of Central and Western Africa, used by natives as ordeal poison. It is a cardiac tonic and narcotic. Cf. *erythrophloeine, muavine.*

satin spar. A satin-like compact variety of calcite. **s. white.** A mixture of calcium sulfate and aluminum hydroxide, produced by the co-precipitation of lime and aluminum sulphate in presence of water; used as a pigment for coating paper.

saturable. Able to be saturated.

saturate. (1) To cause all the atoms of a molecule to become saturated by having all bonds linked up, so that only single bonds exist. (2) To dissolve sufficient substance, either solid or gaseous, in a solution, so that no more of that substance can be dissolved.

saturated. Completely satisfied. **super-** See *supersaturated.* **s. compound.** An organic compound with no free valence, and in which there are neither double nor triple bonds. **s. hydrocarbons.** Paraffins. **s. solution.** A solution that contains so much dissolved substance that no additional quantity can be dissolved at that temperature.

saturation. (1) Complete neutralization of an acid or base. (2) Complete or maximum absorption of a substance by a solvent. (3) Complete satisfaction of the valency bonds in a molecule. (4) A property of color, q.v. Cf. *hydrogenation.* **super-** See *supersaturation.* **s. current.** The maximum current that can pass as a silent discharge through a gas or vapor without decomposing it. The medium is then completely ionized. **s. isomerism.** Isomerism between two compounds, one of which is saturated, and the other unsaturated; as, acetone, $CH_3.CO.CH_3$, and allyl alcohol, CH_2:$CH.CH_2OH$. **s. point.** (1) The concentration at which a solution is saturated with a particular substance. (2) In color printing, the stage at which one color becomes dominant at the expense of the other colors present.

saturnism. Lead poisoning.

saturnus. The alchemical name for lead.

saunders. Sandalwood.

saussurite. An impure form of labradorite.

save. Salvia.

savine. Sabina. The fresh tops of *Juniperus sabina*, an evergreen shrub. It contains essential oil, tannin, and resin; used medicinally as the fluid extract, as a diuretic vermifuge, and aromatic. Cf. *juniperic acid.* **s. oil.** Oleum sabinae. An essential oil from *Juniperus sabina.* A colorless or yellow liquid, d.0.903, which contains pinene, cadinene, sabinene, and sabinol; used medicinally.

savory. The herb *Satureia hortensis* (summer s.) and *S. montana* (winter s.), used as an aromatic and carminative. They contain carvacrol.

saw palmetto berries. Sabal.

saxicoles. A group of lichens.

saxifrage. Pimpinella.

saxin. A brand of saccharin.

Saybolt seconds. A relative unit of viscosity; the time necessary for a specified volume of a liquid to flow through the orifice of a S. viscosimeter at a definite temperature. Cf. *Engler, centipoises, SAE number, rhe.*

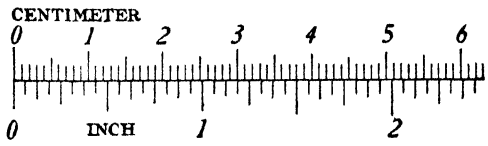
Sb. The symbol for antimony, derived from the Latin stibium.

Sc. The symbol for scandium.

scalar. Any quantity which has magnitude but no direction; e.g., density, volume, mass, work. Cf. *vector.*

scale. (1) A thin, plate-like crystal or flake-like leaflet. (2) A crust of metallic oxides formed on the surface of metals. (3) Boilerstone, or the incrustat on of insoluble salts formed by the evaporation of water. (4) Markings at regular intervals, either on instruments

(meter, yard, thermometer) or on drawings and graphs; as,



(5) A balance used for relative rough weighings.

conversion- A graph which consists of two or more parallel scales, that can be used for the rapid solution of proportional problems. (Cf. *thermometer scales, nomograph.*

s. copper. Copper in thin flakes. **s. stone.** Wollastonite.

scaling index. A measure of the degree of corrosion of a metal in a liquid; the gain in weight in mgrms. per sq. cm. under specified conditions.

scalpel. A small curved knife.

scammonin. $C_{34}H_{56}O_{16}$ = 720.5. A glucoside derived from scammony.

scammony. The dried root of *Convolvulus scammonia* a Convolvulaceae of Syria and Asia minor. It contains the glucoside scammonin, a gum and a resin; used medicinally as a cathartic and anthelmintic, **Mexican-** Ipomoea.

scandia. Scandium oxide.

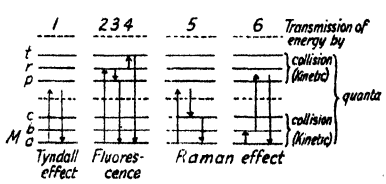
scandium. Sc = 45.10. A rare metal of the aluminum group, atomic number 21. It was predicted by Mendelejeff (as ekaboron), and discovered in 1879 by Nilson. It is a gray metal, m.1350, soluble in acids; valency, three. **s. acetylacetonate.** $Sc(MeCOCHCOMe)_3$ = 342.26. White plates, m.187, b.215, soluble in water. **s. chloride.** $ScCl_3$ = 151.5. Colorless flakes, subliming at 800°C; very soluble in water, alcohol, or ether. **s. hydroxide.** $Sc(OH)_3$ = 96.12. A colorless amorphous powder; insoluble in water. **s. oxalate.** $Sc_2(C_2O_4)_3.H_2O$ = 448.28. White crystals, m.140, insoluble in water. **s. oxide.** Sc_2O_3 = 138.2. Scandia. A colorless amorphous powder, d.3.864; insoluble in water or alcohol, soluble in acids. **s. sulfate.** $Sc_2(SO_4)_3$ = 378.41. A colorless crystalline powder, d.2.574; soluble in water.

scapolite. Wernerite. A white or green calcium, aluminum, sodium silicate containing chlorine.

scarlet. Scarlet R, Biebrich red, aminoazotoluolazo-β-naphthol, $MeC_6H_4N:NC_6H_3MeN:NC_{10}H_{15}OH$. A dark red aniline dye; a dark brown powder, insoluble in water, soluble in chloroform or oils. Used medicinally in ointments.

scatol. Skatole.

scattering. (1) Dispersing. (2) The spitting of molten metals on pouring. **light-** The emission of light from a particle or molecule under illumination, due to resonance and excitation (cf. *luminescence*):



TYNDALL EFFECT, where M_0, the initial and final state of the scattering medium and $h\nu$ and $h\nu\theta$ the incoming and scattered quantum respectively, remain unchanged, except for the new direction of motion at an angle θ; hence:

1. $M_0 + h\nu = M_0 + h\nu\theta$

FLUORESCENCE, where the scattered light is of shorter or longer frequency as compared with the incident light:

2. (absorption) $M_a + h\nu_{ar} \rightarrow M_r$
3. (collision) $M_r \rightarrow M_p + \text{Kin. E.}$
   (emission) $M_p \rightarrow M_a + h\nu_{ap}$
   where the difference (ar) to (ap) represents the shift toward the red (Stokes lines)
4. (collision) $M_r + \text{Kin. E.} \rightarrow M_t$
   (emission) $M_t \rightarrow M_a + h\nu_{at}$
   where $h\nu_{at}$ are anti-Stokes lines.

RAMAN EFFECT, where only a portion of the incoming quanta are used for excitation:

5. $M_a + h\nu_0 \rightarrow M_c + h\nu_1$
   where $h\nu_0 - h\nu_1 = E_c - E_a = h\nu_{ac}$
6. $M_a + \text{Kin. E.} \rightarrow M_b$
   $M_b + h\nu_0 \rightarrow M_a h\nu_2$
   where $h\nu_2 - h\nu_0 = E_b - E_a = h\nu_{ab}$, in which case $h\nu_{ac}$ and $h\nu_{ab}$ correspond with the Raman lines.

COMPTON EFFECT, where a quantum of high frequency (x-rays) dislodges an electron from the scattering substance:

$$E + h\nu_0 \rightarrow E_{fast} + h\nu_1$$

scavenger. A substance used to purify; as, metallic Li which will remove C, S, P, O, N and other impurities from alloys and metals.

Schäffer's acid. Armstrong's acid. Beta-naphtholsulfonic acid, $(6)HSO_3.C_{10}H_6.OH(2)$, or 2-hydroxynaphthalene-6-sulfonic acid; used in organic synthesis.

schapbachite. A native sulfide of lead, bismuth and silver, $PbS.Ag_2S.Bi_2S_3$.

Scheele, Carl Wilhelm. 1742–1786. A Swedish apothecary noted for his discovery of oxygen, chlorine, ammonia, manganese, and barium. **S.'s green.** An acid copper arsenite, $CuHAsO_3$, used as pigment.

scheelite. A native calcium tungstate, $CaWO_4$.

scheelium. An obsolete name for tungsten.

scheererite. A solid mineral hydrocarbon, m.45, b.92.

Scheibler, Carl. 1827–1899. A German chemist noted for developments in the sugar industry. **S.'s reagent.** A solution of phosphotungstic acid. It forms a yellow precipitate with the sulfates of the alkaloids.

scheme. A diagram, graph, flow-sheet, or an outline of a subject.

schieferspar. A flake-like variety of calcite.

Schiff, Hugo. 1834–1915. A German organic chemist. **S.'s bases.** A series of condensation products of aromatic amines and aliphatic aldehydes of the type, $R.N:CHR$; as: $PhNH_2 + OCH.Ph = PhN:CHPh + H_2O$. **S.'s reagent.** Thioacetic acid. **S.'s solution.** A solution of 0.2 gm. rosaniline, and 15 cc. sulfurous acid in 200 cc. water; used as a test for aldehydes. **S.'s test.** A test for aldehydes, which restore the red color of a magenta solution that has been bleached with sulfur dioxide.

schiller spar. Bronsite.

schinus oil. An essential oil from the pepper tree, *Schinus molle*, an Anacardiaceae of North America, d.0.850, containing phellandrene, pinene and carvacrol.

schist. A crystalline rock that can be split into scales or flakes.

schistic. Not aschistic (q.v.).

schizomycetes. Schizophyta, fission fungi, bacteria. A large group of plant microorganisms that belong to the chlorophyll-free or fungi class. They are commonly known as bacteria, and are divided into:

family 1—Coccaceae, round or spherical in shape—
genus I—Streptococci, forming bead-like chains.
genus II—Micrococci, forming grape-like clusters.
genus III—Sarcina, forming bale-like packs.
genus IV—Planococcus, like II but mobile.
genus V—Planosarcina, like III but mobile.
family 2—Bacteriaceae, cylindrical or rod-like in shape.
family 3—Spirillaceae, curved or S-like in shape. See *bacteria*.

Schizophyta. Schizomycetes.

schlempe. Vinasse.

schlieren. The region of changing refraction in an otherwise optically-homogeneous medium, (gas or liquid); *e.g.*, heat waves seen over a hot surface, or the threads seen on mixing glycerol and water.

Schlippe, Carl Friedrich von. 1799–1874. A German-born Russian chemist. **S.'s salt.** Sodium sulfantimonate, $Na_3SbS_4.9H_2O$.

Schlotterbeck reaction. The synthesis of ketones from aldehydes: $R.CHO + CH_2N_2 \rightarrow R.CO.CH_3 + N_2$. Cf. *Nierenstein reaction*.

Schmoluchowski's equation. The average length, A, of the path of a particle in a dispersed system (in μ) is:

$$A = 2.37\sqrt{K.\frac{RT}{N}.\frac{t}{\eta r}}.$$

where R = gas content, N = Avogadro's number, T = absolute temperature, t = period of vibration of the particle, η = viscosity of the medium, r = radius of the particle.

schneebergite. $CaSbO_3$. A native calcium antimonite.

Schneider's furnace. A retort for the distillation of zinc from zinc-lead ores.

schœ- See *Schoe-*.

Christian Friedrich Schoenbein.

Schoenbein, Christian Friedrich. 1799–1868. A German chemist noted as discoverer of ozone and work on catalysis, nitrocellulose and hydrogen peroxide.

Schoenherr process. A nitrogen fixation method in which the air circulates spirally around an electric arc about six meters long.

schöenite. $K_2SO_4.MgSO_4.9H_2O$. A Stassfurt salt (q.v.) which consists of hydrated potassium magnesium sulfate.

Schöllkopf's acid. (1) *1*-Naphthol-*4.8*-disulfonic acid. (2) *1*-Naphthylamine-*4.8*-disulfonic acid. (3) *1*-Naphthylamine-*8*-sulfonic acid.

schorl. Tourmaline.

Schörlemmer, Carl. 1834–1900. A German chemist, noted for his textbooks.

schorlomite. A titanium garnet, (q.v.); a native silicate of titanium, iron and calcium.

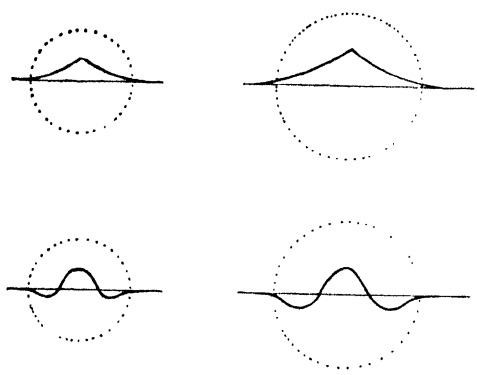
Schotten, Carl. 1853–1910. A German organic chemist noted for his synthetic methods. **S.'s reaction.** Acylation in alkaline solution with benzoyl chloride.

schou oil. A gelatinous product of the oxidation of soy bean oil, used as emulsifying agent in the margarine industry.

schraufite. $C_{11}H_{16}O_2$. A fossil resin in Carpathian sandstone.

schreibersite. $(FeNiCo)_3P$. A mixed phosphide, in certain meteorites.

Schrödinger, Erwin. 1887– . A German physicist noted for his atomic concepts. **S. atom.** Pulsating or fluctuating atom. A co



Schrödinger atoms.

cept of atomic structure based on wave mechanics, q.v. The atom is regarded as a sphere of electricity which may vary slightly in its density, but which may pulsate (corresponding with Bohr's orbits) throughout the whole in either a simple or complex manner. Radiation may be absorbed or liberated by these fluctuations (energy levels). The emission of electrons is regarded as the "breaking off" of a part of the vibrations. **S. equation.** Wave equation. The differential equation

$$\frac{\partial^2\psi}{\partial x^2} + \frac{\partial^2\psi}{\partial y^2} + \frac{\partial^2\psi}{\partial z^2} + \frac{8\pi^2 m}{h^2}(W - V)\psi = 0,$$

which determines the statistical charge density $\psi(x, y, z)$ or the probability that the electron may be in the volume (x, y, z). Cf. *Heisenberg principle*.

Schrötter apparatus. Calcimeter.

Schulze's rule. The precipitating effect of an ion varies with its valency.

Schumann rays. The extreme ultra-violet portion of the spectrum which affects a photographic plate. Cf. *radiation, ultra-violet*.

Schütz-Borrisow rule. Enzyme activity is proportional to the square root of the amount of enzyme present: $x = tK\sqrt{c}$, where x is the amount of substance digested, t = 24 hours, K is a constant, and c the concentration of the enzyme.

Schwarz, Karl Leonhard Heinrich. 1824–1890. A German industrial chemist, noted for volumetric methods.

schwatzite. A tetrahedrite containing mercury.

Schweinfurt green. Cupric subacetate.

Schweitzer, Mathias E. 1818–1860. A German chemist. **S's reagent.** An ammoniacal solution of cupric hydroxide, which dissolves cellulose. It is prepared by adding KOH to a solution of $CuSO_4$ and NH_4Cl, and dissolving 3 gm. of the moist, filtered precipitate in 1000 cc. of 20 % NH_4OH.

schwellenwert. Liminal value, threshold value. The minimum quantity of electrolyte required to precipitate a colloidal solution.

sciadopitene. $C_{20}H_{32}$ = 272.3. A diterpene, m.95.5, from the wood oil of *Sciadopitys verticillata*, the parasol-pine, or umbrella fir of Japan.

science. Systematized and verifiable knowledge reached by observation, measurement and/or experiment. Science primarily describes, measures and coordinates facts, but does not explain their ultimate cause (philosophy, q.v.). It is conveniently classified into:

FORMAL BRANCHES OF SCIENCE

Logic	ideas and concepts
Mathematics	numbers and magnitudes
Geometry	space and extension
Phoronomy	motion, time and relativity

NATURAL BRANCHES OF SCIENCE

(a) experimental:

Physics	energy transformations
Chemistry	matter transformations

(b) descriptive:

Astronomy	the universe
Geology	the earth

BIOLOGICAL BRANCHES OF SCIENCE

Botany	structure and functions of plants
Zoology	structure and functions of animals
Anthropology	man
Psychology	human behavior
Economics	human relationship
Sociology	human society

scientific. Based upon systematized and verifiable facts or experience. Antonym: empirical.

scientist. One engaged in the study of a branch of science.

scilla. Squill.

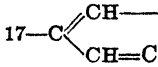
scillain. (1) An amorphous glucoside obtained from the bulbs of *Scilla maritima*, squill. (2) Scillipicrin.

scillarabiose. $C_{12}H_{22}O_{10}$ = 326.1. A disaccharide obtained by acid hydrolysis of scillaren. It hydrolyzes to rhamnose and *d*-glucose.

scillaren. $C_{37}H_{54}O_{13}$ = 706.4. A glucoside from squill, *Scilla maritima*, a yellowish powder, m.230–240, hydrolyzing to scillaradin and scillarabiose. It is a cardiac tonic and diuretic. **s. B.** A mixture of glucosides of greater physiological activity than s.

scillarenase. A hydrolytic enzyme attacking scillaren.

scillaridin. $C_{35}H_{32}O_8$ = 380.0. A cardiac glucoside related to scillin. **s. A.** 14-OHΔ5:6.-



17—C; A cholane (q.v.) diglycone.

scillin. A yellow, crystalline glucoside from the bulbs of *Scilla* species.

scillipicrin. Scillain. A yellow, amorphous glucoside from the bulbs of *Scilla maritima;* used as a diuretic.

scillitin. $C_{17}H_{28}O_6$ = 325.19. A bitter principle, m.154, from the bulbs of *Scilla maritima*, squill. A brownish-black mass, used medicinally as a diuretic.

scillitoxin. A brown, amorphous glucoside from squill; used medicinally.

scintillascope. Spinthariscope.

scintillation. (1) Burning with brilliant sparks, as an iron wire in oxygen. (2) The emission or production of sparks or points of light; as, in a spinthariscope.

scission. (1) The splitting of a molecule; as, the breaking of a carbon atom from a chain. (2) Ring breakage. The opening of an atomic ring. (3) Fission, the division of a living cell (see *cell division*).

Scitaminaceae. An order which includes the *Musaceæ* or banana family, a group of tropical plants from which various important drugs are obtained:

Zingiber officinale	ginger
Alpinia officinarum	galanga
Curcuma zedoaria	zedoary
Curcuma longa	turmeric
Elettaria cardamomum	cardamom seed
Amomum melegueta	grains of paradise
Maranta arundinaceae	arrowroot
Musa sapientum	banana, plantain

sclareol. $C_{54}H_{88}O_3$ = 759.5. A tertiary unsaturated polyhydric alcohol, the principal constituent of oil of sage and similar to sterols.

sclerethryrin. A red coloring matter in ergot.

sclero-, sklero- A prefix derived from the Greek, which indicates hard or solid. **s-lac.** A suggested name for the hard resin of commercial shellac.

sclerometer. An instrument for determining the hardness of materials from the pressure on a moving diamond point necessary to produce a scratch.

scleron. A light, non-corrodible alloy of aluminum with Si, Cu, Fe, Mn, Zn and Li.

scleroproteins. A group of proteins in animal skeletons.

scleroscope. An instrument for determining the hardness of substances from the extent to which a steel ball rebounds after being dropped from a certain height. *Cf. Shore hardness.*

sclerotic acid. Sclerotinic acid, ergotic acid. A yellowish-brown substance from ergot.

scolecite. $CaAl_2Si_3O_{10}.3H_2O$. A white or yellow mineral.

scoliodonic acid. $C_{24}H_{36}O_2$ = 358.3. A highly-unsaturated acid from hiragashira oil, q.v.

scombrin. A protamine from mackerel sperm, containing 88.8 % arginine.

scombron. A histone from immature mackerel sperm.

scoparin. $C_{20}H_{20}O_{10}$ = 420.2. A yellow crystalline principle from scoparius.

scoparius. Spartium. Broom tops. The dried tops of *Cytisus scoparius*, a Leguminosae. It

contains sparteine and scoparin; used medicinally, as the fluid extract, as a diuretic and purgative.

scopine. $C_8H_{13}NO_2$ = 155.1. *2,3*-Epoxytropan. A product of hydrolysis of scopolamine, and isomer of scopoline.

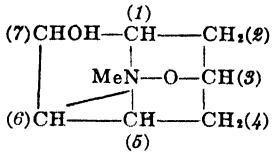
scopola. The dried rhizome of *Scopola carniolica*, (Solanaceae). It contains the belladonna alkaloids; used medicinally. Cf. *atroscine*.

scopolamine. *d*-Hyoscine. *l*-Atroscine. **s. hydrochloride.** Hyoscine hydrochloride.

scopoleine. $C_{17}H_{21}O_4N$ = 303.2. A crystalline alkaloid from several *Scopola*, *Duboisia*, and *Atropa* species.

scopoletin. $C_{10}H_8O_4$ = 192.06. Chrysatropic acid, gelsemic acid, 7-hydroxy-6-methoxycoumarin, β-methylesculetin. Colorless crystals, m.204.

scopoline. $C_8H_{13}O_2N$ = 155.1. A decomposition-product of scopolamine (hyoscine). Colorless crystals, m.110, b.242; soluble in water or alcohol.



scopomannite. Stable scopolamine. A solution of scopolamine hydrobromide in water containing 10 % mannitol.

scopometer. An optical instrument with an optical wedge for visual measurement of turbidity or opalescence by observing the disappearance of an illuminated target.

scopometry. A branch of nephelometry (q.v.); matching colors or turbidities by comparing an illuminated line against a field of constant intensity.

scorbutanin. Vitamin C.

scorification. The roasting, fusion, and oxidation of gold and silver ores with lead and borax glass in a shallow clay vessel in a muffle; used in the assay of ores.

scorifier. A shallow clay vessel with a thick bottom; used in assaying gold and silver ores.

scorodite. $Fe_2O_3.As_2O_5.4H_2O$. Pitticite. A native, hydrated ferrous arsenate.

scorodites. A group of minerals of the general formula, $M_2O_3.N_2O_5.xH_2O$; M is ferric iron or aluminum, and N is arsenic or phosphorus.

scotogram. Scotograph.

scotograph. Scotogram, skotogram, skiagraph. An image produced on a photographic plate in the dark by human radiations.

scotographic. Affecting a photographic plate in the dark.

scotography. Skiagraphy. The study of human radiations, radioactivity, aura, or od-rays, q.v.

scotoma. A spot within the visible field in which there is no vision.

scouring. (1) Corroding; as by certain ores that attack furnaces. (2) Cleaning; as, removing the grease or stain from a vessel. **s. cinder.** A basic slag that attacks the lining of a shaft furnace. **s. rush.** Equisetum.

scraper. A tool for cleaning surfaces.

scraping. The cleaning of surfaces with a sharp-edged tool.

scrapping. Breaking up metal castings, etc. with explosives or mechanically.

screen. (1) A sieve of wire cloth, textile or perforated metal plates, used to sort material according to the sizes of its particles. (2) A stretched cloth or prepared surface on which light or images are projected. (3) An apparatus with *circular* apertures as compared with a sieve (*square* apertures). **fluorescent-** A plate coated with calcium tungstate or barium thiocyanate; used to make visible ultra-violet rays, x-rays and other rays which ordinarily are invisible to the eye. **revolving-** A steel cylinder, usually inclined, with round holes, for separating materials passing through it.

s. analysis. The separation of a material into portions which consist of particles of definite sizes, by means of a series of screens of graded sizes.

screening effect. An assumption that a definite relationship exists between the effective nuclear charge of an atomic nucleus and the charge on its surrounding electrons; *i.e.*, in any atom the inner orbital electrons act as screens between the nucleus and the outer orbital electrons, and thus decrease the effective nuclear charge of the latter. Hence the innermost orbital electrons exert the *largest*, and the outermost the *smallest* screening effect. Cf. *Pauling structure, Lucas theory*.

scrophularia. Figwort, rosenoble. The herb of *S. nodosa*, a Scrophylariaceae, used as a diuretic and anodyne. **water-** Bishop's leaves. The leaves of *S. aquatica*, used externally for poultices.

Scrophulariaceae. Figwort family. A large group of herbs and shrubs that contain glucosides and several important drugs.

Leaves:	
Digitalis purpurea	foxglove digitalin
Curanga amara	curangin
Euphrasia officinalis	eyebright
Verbascum thapsus	mullein
Herbs:	
Veronica officinalis (speedwell)	veronica
Scrophylaria nodosa (figwort)	scrophularia
Chelone glabra (balmony)	chelonine
Rhizome:	
Veronica (*Leptandra*) *virginica*	leptandra

scrubber. A device for washing or absorbing gases; used extensively in chemical plants for purification dissolving, or reacting gases in or with liquids.

scruff. The dirt or impurities on the surface of an object. Cf. *scurf*.

scruple. ℈. A unit of apothecaries' weight: 1 scruple = 20 grains = 1.295978 grams = 0.3 drachms or drams.

scullcap. Scutellaria.

scum. The impurities that rise to the surface of molten materials. Cf. *oly, froth*.

scurf. Material which flakes off; dross. Cf. *scruff*.

scutellaria. Scullcap, helmet flower. The dried plant of *Scutellaria lateriflora*, a Labiatae of North America. It contains scutellarin and an essential oil; used medicinally, as the fluid extract, as an antispasmodic and tonic.

scutellarin. $C_{10}H_8O_5$ = 176.1. A non-toxic crystalline principle from the leaves of scutellaria. Yellow needles, m.199; insoluble in water, soluble in alcohol, ether or chloroform.

scyllitol. $C_6H_6(OH)_6$ = 180.09. An isomer of inositol and constituent of the soap plant,

Helinus ovata, a Rhamnaceae, of South Africa; used as an emetic by the Zulus.

Se. The symbol for selenium.

sea salt. (1) Sodium chloride obtained by evaporating sea water. (2) The residual mixture of salts on evaporating sea water. **s. water.** See *hydrosphere, water.* **s. weed.** Kelp. **s. wrack.** Fucus.

seal. A quantity of water, mercury, wax, oil, or other substance placed around joints or connections to prevent the ingress of air. **vacuum-** The mercury surrounding joints or stopcocks.

sealing wax. A colored and scented mixture of resins and shellac; used for sealing purposes.

seam. A stratum or bed of a mineral or ore.

sebacic acid. $C_{10}H_{18}O_4$ = 202.19. Ipomic acid, decanedioic acid*, *1.8*-octane-dicarboxylic acid, $COOH(CH_2)_8COOH$. Colorless leaflets, m.133, $b._{100mm}295$; soluble in water, alcohol or ether.

sec. (1) An abbreviation for second, a unit of time. (2) An abbreviation for secondary. (3) Dry.

secale cereale. Rye. **s. cornutum.** Ergot.

secaline. Trimethylamine.

secalonic acid. $C_{14}H_{14}O_6$ = 278.1. A yellow, crystalline coloring material found in ergot.

secalose. A carbohydrate from rye. A white, hygroscopic powder. Cf. *trifructosan.*

Secchi, Angelo. 1818–1876. An Italian Jesuit and astronomer, noted for spectrum analysis and polaroscopic experiments.

sechometer. A hand-driven induction apparatus.

secohm. A unit of self inductance; 1 ohm per second.

seconal sodium. Sodium 5-allyl-5-(1-methyl-butyl) barbiturate, a short-acting barbiturate.

second. sec. The $\frac{1}{86}$ part of a minute; 1/86,-164.09 of a sidereal day; 1(24 × 60 × 60) of a mean solar day. 1 second = 1000σ (sigma) = 3.168876 × 10^{-8} year. **s. ionization constant.** See *ionization constant.*

secondary. (1) Second in order. (2) Next in importance. **s. alcohol.** An organic compound which contains the bivalent =CHOH radical. **s. amine.** An organic compound containing the bivalent =NH radical. **s. carbon atom.** A carbon atom that is directly attached to two other carbon atoms. **s. metal.** Metal recovered from scrap, sweepings, skimmings, drosses, etc. This does not imply inferiority, but distinguishes from primary m., (made directly from an ore). **s. mineral.** A mineral that is formed from a primary mineral; as, a sulfate formed by oxidation of the sulfide. **s. reaction.** Subsidiary *reaction.* **s. x-rays.** The scattered radiations emitted from a substance exposed to x-rays. They are characteristic of the substance, and are used for analytical purposes.

secretin. A polypeptide containing P, tyrosine, etc., from the intestinal mucosa of the pig, and from plants; slightly soluble in water, insoluble in alcohol. It acts on the secretion of the pancreas and liver, and excites peristalsis. Cf. *hormone.*

secretion. The formation and separation of a definite substance, other than a waste material, from a living organism or organ; as, resins from plants, serum from wounds, hormones from glands.

section. A thinly-cut piece of a substance for microscopic study. **histological-** A thin cut of a plant or animal tissue. **metallographic-** A thin cut of an alloy or metal.

sector. The area included between an arc an two radii.

sectrometer. A vacuum tube titrimeter for potentiometric titrations, in which a cathode ray tube replaces the micro-ammeter and the end-point is a sudden permanent change in the shadow angle on a fluorescent screen. Cf. *titrimeter, potentiometer.*

securite. An explosive not ignited by fire-damp and used in mines. It contains ammonium nitrate and oxalate, and di-nitrobenzene.

sedanolid. $C_{12}H_{18}O_2$ = 194.14. The lactone of sedanolic acid, a constituent of celery seeds, *Apium graveolens.*

sedanonic anhydride. $C_{12}H_{18}O_3$ = 210.14. A white powder from celery seeds.

sedatin. Valeridin.

sedatine. Antipyrine.

sedative. An agent that has a calming effect, and counteracts stimulation, irritation or excitement; as, bromides. Antonym: stimulant.

sediment. A deposit of an insoluble material, especially if settled by gravitation. Cf. *precipitate, sedimentation settling.*

sedimentary rock. A rock formed by the accumulation of grains or fragments of rock carried by water or air.

sedimentation. The precipitation or settling of insoluble materials from a suspension, either naturally (by gravity) or artificially (by a centrifuge). **rate of-** See *settling, Stokes' law.* **free s.** S. in which the particles exert no mutual interference. Stokes' law then applies. **hindered s.** The opposite of free s.

sedoheptose. $C_7H_{14}O_7$ = 210.1. A heptoketose from *Sedum* species.

sedormid. The registered trade-mark for allyl-isovalerylurea, a hypnotic.

sedum. The herb of *Sedum acre*, a Crassulaceae, which contains alkaloids, carbohydrates, and a mucilage; used externally for wounds.

Seebeck, Thomas Johann. 1770–1831. A German physicist; discoverer of thermoelectricity and the magnetism of cobalt and nickel.

seed lac. See *lac.*

seeds. The product of fertilized and developed ovules of plants. They are usually rich in proteins, carbohydrates and oils, and are an important source of food; *e.g.*, those of Gramineae (grains) and Leguminosae (peas and beans). Some of the seeds are official, medicinally. (See *fruits.*)

Bitter almond	Nutmeg
Black mustard	Physostigma
Cacao	Staphisagria
Cardamom	Stramonium
Colchicum	Strophanthus
Linseed	Sweet almond
Nux vomica	White mustard

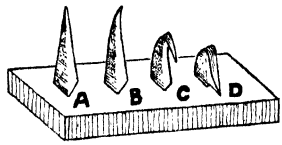
seekay wax. C.K. *wax.*

seepage. (1) The percolation or oozing of a fluid through a porous material; also the fluid which collects as a result of it. (2) The separation of two phases.

Sefström, Nils Gabriel. 1787–1845. A Swedish chemist and mineralogist, noted for the discovery of vanadium.

Seger, Hermann A. 1839–1893. A German technologist noted for ceramic research. **s. cones.** Pyrometric cones. Small pyramids of various clay and salt mixtures; used to indi-

cate the temperature of a furnace. Each cone softens at a definite temperature, ranging form 500°C to 2000°C.



Seger cones.

seggar. Clay boxes in which ceramics are kilned.

segregate. To separate.

Seidlitz powder. An effervescent mixture of potassium sodium tartrate, sodium bicarbonate and tartaric acid; used for making an alkaline mineral water.

Seignette's salt. Potassium sodium tartrate.

seismometer. An instrument for recording shocks (*e.g.*, due to distant earthquakes).

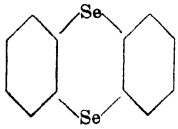
sekisanine. $C_{34}H_{34}O_9N_2$ = 614.3. Dimethylhydroxy-lycorine. A physiologically-inactive alkaloid from the bulbs of *Lycoris radiata*, an Amaryllidaceae; colorless prisms. Cf. *lycorine*.

s. mixte. A natural mixture of NaCl and $MgSO_4.7H_2O$, deposited in the salt lakes of the Volga regions, U.S.S.R.

selacholeic acid. $C_{24}H_{46}O_2$ = 366.3. Nervonic acid, 6.15-tetracosenoic acid*. A fatty acid, $Me(CH_2)_7CH:CH(CH_2)_{13}COOH$, from shark liver oil.

selachyl alcohol. $C_{21}H_{42}O_3$ = 342.3. A liquid glyceryl ether, $C_{18}H_{35}OC_3H_5(OH)_2$, from shark liver oil. Cf. *batyl, chimyl*.

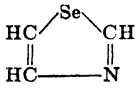
selenanthrene. $C_{12}H_8Se_2$ = 310.4.



Cf. *thianthrene*.

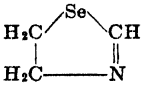
selenate. A salt of selenic acid, M_2SeO_4.

selenazole. C_3H_3NSe = 132.18. The pentatomic ring,

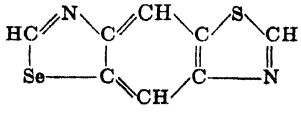


It is known only as its derivatives.

selenazoline. C_3H_5NSe = 134.18. The pentatomic ring compound,



selenazolobenzothiazole. The heterocyclic compound,



selenic. A compound of tetravalent or hexavalent selenium. **s. acid.** $H_2SeO_4[xH_2O]$ = 145.2. An isolog of sulfuric acid. Colorless, hexagonal prisms, d.2.95, m.58, b.260; soluble in water, alcohol or ether. Its salts are the selenates.

selenide. A binary compound of divalent selenium of the type, M_2Se; or an organic compound containing divalent selenium, =Se. **di-** A compound of the type R.Se.Se.R. Cf. *disulfide*. **hydro-** A compound containing the monovalent HSe— radical. Cf. *selenyl*.

seleninic acid*. An organic compound having a $—SeO_2H$ radical; as, $PhSeO_2H$, benzene seleninic acid. Cf. *selenonic acids*.

selenino. The monovalent radical, (HO)OSe—, derived from selenious acid. Cf. *selenono*.

selenious. Selenous. A compound containing divalent or tetravalent selenium; as, $SeCl_2$, SeO_2. **s. acid.** H_2SeO_3 = 129.2. A colorless crystalline powder, d.3.065, decomp. by heat, soluble in water, alcohol or ether. Its salts are the selenites. **s. oxide.** Selenium dioxide.

selenite. (1) A salt of selenious acid of the general type, M_2SeO_3. (2) $CaSO_4.2H_2O$. A native gypsum.

selenium. Se = 78.96, or Se_8 = 631.68. A nonmetal of the sulfur group, and element atomic number 34. It occurs in several modifications: (a) *metallic*. A hexagonal, gray, crystalline powder, d.4.80, m.217, b.690; insluble in water, carbon disulfide, or alcohol, soluble in ether or conc. sulfuric acid. (b) *crystalline*. A dark red, monoclinic, crystalline powder, d.4.47, m.180–200; soluble in carbon disulfide. (c) *amorphous* or liquid (*i.e.*, supercooled): A red amorphous powder obtained by precipitation, $d._{20}$*4.26, m.100, soluble in carbon disulfide. (d) *colloidal*. A red solution, which slowly deposits amorphous selenium. Selenium was discovered in 1817 by Berzelius in the lead chambers of a sulfuric acid plant. It burns with a blue flame and garlic-like odor to its dioxide, SeO_2. It has a valency of 2, 4, and 6, and forms the following series of compounds:

valence number:	−2	0	+4	+6
ion or radical:	Se^{--}	Se	SeO_3^{--}	SeO_4^{--}
name of compounds:	selenides	selenium (element)	selenite	selenates

——Oxidation——→
←——Reduction——

The electrical resistance of metallic selenium decreases with the intensity of illumination, and it is used for s. cells (q.v.) and the optophone (q.v.); also for making red glasses, enamels and glazes, and in insecticides (selocide).

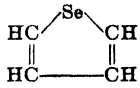
s. bromide. (1) Se_2Br_2 = 318.2. S. monobromide. A dark red liquid, m. −46. (2) $SeBr_2$ = 239.0. S. dibromide. A brown liquid. (3) $SeBr_4$ = 398.8. S. tetrabromide. Orange-red crystals; soluble in carbon disulfide. **s. cell.** An arrangement of metallic s. plates enabling electricity or sound to be transmitted by means of light, or vice versa; the electrical resistance of the cell varies according to its exposure to light of different intensities. Used in telephotography and radiophotography. **s. chloride.** (1) Se_2Cl_2 = 229.4. S. monochloride. Brown crystals. (2) $SeCl_2$ = 150.1. S. dichloride, selenous chloride. A brown oily liquid. (3) $SeCl_4$ = 221.0. S. tetrachloride, selenic chloride. Yellow crystals. **s. dibromide.** See *s. bromide*. **s. dichlo-**

ride. See *s. chloride.* **s. diethyl.** $SeEt_2$ = 137.3. Ethylselenide, $Se(C_2H_5)_2$. A colorless liquid, b.108; insoluble in water, soluble in ether. **s. dimethyl.** $SeMe_2$ = 109.3. Methylselenide, $Se(CH_3)_2$. A colorless liquid, b.58; insoluble in water, soluble in ether. **s. dioxide.** See *s. oxide.* **s. hydride.** Hydrogen selenide. **s. iodide.** (1) Se_2I_2 = 412.2. S. monoiodide. A brown solid, m.65; decomp. by water. (2) SeI_4 = 586.9. S. tetraiodide, selenic iodide. A green solid, m.77, decomp. by water. **s. monobromide.** See *s. bromide.* **s. monochloride.** See *s. chloride.* **s. monoiodide.** See *s. iodide.* **s. nitride.** Se_2N_2 = 186.4. An amorphous yellow solid, explodes at 200°C; insoluble in water, soluble in carbon disulfide. **s. oxide.** SeO_2 = 111.2. S. dioxide, selenious acid anhydride. A colorless, crystalline powder, d.-3.954, sublimes at 260°C, m.390, decomp. by further heat; soluble in water, alcohol, ether, acids or alkalis. **s. oxides.** A group of organic compounds which contain the divalent =SeO radical; as Me_2SeO. **s. oxychloride.** Selenyl chloride. **s. sulfide.** SeS = 111.3. A yellow solid, d.$_0$°3.06, m.118, insoluble in water, soluble in ether or carbon disulfide.

seleno. The divalent atom, =Se. Cf. *sulfo, telluro, keto.* **s. diphenylamine.** Phenoselenazine. **s. furan.** See *selenofuran.* **s. naphthene.** Benzoselenofuran.

selenocyano. The monovalent radical NCSe—.

selenofuran. C_4H_4Se = 131.2. Selenophene. The pentacyclic compound,



A colorless mobile liquid, m. −38, b.109.9; insoluble in water, soluble in acetone or benzene. It resembles thiophen and burns in air with a blue flame, forming selenium.

selenoid. Solenoid. A hollow cylinder, wound with resistance wire and used for producing fields of electric force.

selenole. See *piaselenole, tolupiaselenole.*

selenomercaptan. An organic compound of the type R.SeH.

selenonic acids*. A group of organic compounds which contain the monovalent —SeO_3H radical, analogous to sulfonic acids; as $MeSeO_3H$, methane selenonic acid. Cf. *seleninic acid.*

selenonium. Tetravalent selenium, as in $RSeH_3$. Cf.-*onium.*

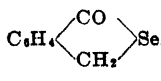
selenono. The monovalent radical, HO_3Se—, derived from selenic acid. Cf. *selenino.*

selenonyl. The divalent radical —SeO_2—. Cf. *sulfuryl.*

selenophene. Selenofuran.

selenophenol. C_6H_6Se = 157.25. PhSeH. A colorless liquid, d.1.487, b.183.

selenophthalide. C_8H_6OSe = 197.2. The heterocyclic compound,



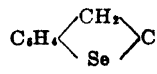
Colorless crystals, m.58; soluble in alcohol.

selenopyronine. Selenoxanthene.

selenotungstate. A salt containing the green =WSe_4 radical; as, $(NH_4)_2WSe_4$. **di-** A salt containing the red =WSe_2O_2 radical; as, $(NH_4)_2WSe_2O_2$.

selenous. Selenious.

selenoxanthene. Selenopyronine. $C_{13}H_{10}Se$ = 245.2.



selenoxanthone. 9-Keto selenoxanthene.

selenurea. $NH_2.CSe.NH_2$. **pseudo-** HSe.C:-$NH.NH_2$.

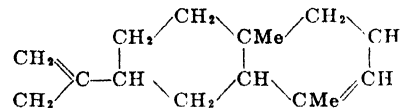
selenuretted. A substance impregnated or combined with hydrogen selenide.

selenyl. (1) The monovalent radical HSe—. (2) The divalent radical, =SeO. **s. chloride.** $SeOCl_2$ = 166.1. Selenium oxychloride. A colorless liquid, m.10, b.180, decomp. by water.

self-inductance. The e.m.f. produced in a circuit by a unit rate of variation of the current passing through it.

self-induction. A change in the magnetic field of a conductor, produced by a variation in the current passing through it.

selinene. $C_{15}H_{24}$ = 204.2. A sesquiterpene from celery seed oil. A colorless liquid, b.$_{16mm}$135, d.0.914; soluble in alcohol.



sellaite. MgF_2. A native magnesium fluoride.

selocide. An insecticide made by dissolving selenium in potassium ammonium sulfide solution equivalent to 30% $(KNH_4S)_5Se$. For sprays it is diluted 100–200 times with soap water.

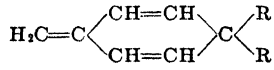
selwynite. Yellow *ocher.*

semecarpus. Marking nut, Oriental cashew nut, acajou nut. The fruit of *S. anacardium,* an East Indian Anacardiaceae. Its acrid juice is used as a black stain.

semen. The fecundating fluid of the male. See ***Florence test.***

semi- A prefix derived from the Latin, indicating "half" = hemi (Greek) = demi (French).

semibenzenes. A group of compounds of the type:



semicarbazide. CH_5ON_3 = 75.1. Hydrazine carboxamide, aminourea, carbamyl hydrazine. An amide and hydrazide of carbonic acid, $NH_2.NH.CO.NH_2$. Colorless, fine prisms, 1 2 3 4 m.96; soluble in water, alcohol, ether or benzene Used as a reagent for aldehydes and ketones, and in organic synthesis. **4-amino-** Carbohydrazide.

s. hydrochloride. $CH_5ON_3.HCl$ = 111.5. Amidourea hydrochloride. Colorless prisms, m.175, soluble in water or alcohol, insoluble in ether; used in organic synthesis, and as reagent for aldehydes and ketones.

semicarbazido. The monovalent group, $NH_2.CO.NH.NH$—.

semicarbazone*. A condensation-product of aldehydes or ketones and semicarbazide, of the general type $R_2C:N.NH.CO.NH_2$; as, $(CH_3)_2C:N.NH.CONH_2$, propane (or acetone) semicarbazone.

semicoke. A fuel made from coal by low temperature carbonization at 1100°F.; it burns smokelessly with very little ash.

semiconductor. A substance which allows the passage of current in one direction only, and therefore, can be used as a rectifier; *e.g.*, cuprous sulfate, galena.

semidines. A group of aromatic amines of the type, $R.C_6H_4.NH.C_6H_4.NH_2$. According to the position of the NH_2-group, they are termed ortho- or para-semidines. **s. rearrangement.** A special type of benzidine re-arrangement (q.v.) in which only one half of the molecule is supposed to rotate; as,

$$R.C_6H_4.NH.NH.C_6H_4.R \rightarrow R.C_6H_4.NH.C_6H_3RNH_2.$$

semi-drying oils. Fatty oils which thicken slowly on exposure to light and air.

semi-metal. An obsolete name for an element (such as arsenic), which is midway in properties between metals and non-metals.

seminase. An enzyme in alfalfa.

seminose. d-Mannose.

semiopal. A native silica.

semipermeable. Permitting the passage of certain molecules, and hindering the passage of others. **s. membrane.** A diaphragm or septum through which certain substances pass, while others are retained; as a cell membrane, parchment, or artificially-treated porous cups. (See *osmosis.*)

semiprecious. A gem or metal used for decorative purposes, which is inferior to the precious grades.

semisilica brick. A fire-brick made from a siliceous clay, or from a mixture of fireclay and ganister, and containing 80–92 % silica.

semisolid. Soft and slowly flowing; as, asphalt.

semivalence. A mono-electronic link between two rigid systems, built up from two octets or two closed electronic systems. It is characteristic of unstable, intermediate, addition compounds formed during certain reactions, and is less stable than the ordinary non-polar bond (bi-electronic link).

Semmler, Friedrich Wilhelm. 1860–1931. A German organic chemist noted for his work on the constitution of essential oils.

senarmontite. A native antimony trioxide, Sb_2O_3.

seneca oil. Petroleum.

senecifolic acid. $C_{10}H_{16}O_6$ = 232.1. The acid product of hydrolysis of senecifoline.

senecifolidine. $C_{18}H_{25}NO_7$ = 367.2. An alkaloid from *Senecio latifolius.* Rhombic plates, m.212.

senecifoline. $C_{18}H_{27}NO_8$ = 385.22. An alkaloid from *Senecio latifolius,* a Compositae of South Africa. Colorless rhombic plates, m.194, soluble in ether or chloroform. **s. hydrochloride.** $C_{18}H_{27}NO_8.HCl$ = 421.68. White crystals, m.260, soluble in water.

senecifolinine. $C_8H_{11}NO_2$ = 153.1. A basic hydrolysis product of senecifoline.

senecine. An amorphous, alkaloid from *Senecio vulgaris.*

senecio. Life root, ragwort squaw-weed. The dried herb of *Senecio aureus;* used as the fluid extract, as a tonic and diuretic. **s. alkaloids.** A group of alkaloids from s.; as, jacobine, necine, retronecine, retrorsine, senecifoline, senecifolidine, senecionine.

senecioic acid. $C_5H_8O_2$ = 100.06. Isopropylidene acetic acid, β-methyl-α-butenoic acid, β-methylcrotonic acid, $Me_2C{=}CH.COOH$. An isomer of tiglic acid.

senecionine. $C_{18}H_{25}NO_6$ = 351.2. An alkaloid from *Senecio vulgaris,* groundsel, a Compositae.

senega. Senega snakeroot. Rattlesnake root. The dried root of *Polygala senega,* a Polygalaceae. It contains senegin and polygalin; used medicinally as the fluid extract.

senegenin. $C_{26}H_{44}O_6$ = 452.4. Senegeninic acid. A dibasic acid hydrolysis product of senegin. A colorless powder, m.272.

senegeninic acid. Senegenin.

senegin. (1) $C_{32}H_{52}O_{17}$ = 708.4. A saponin derived from senega. (2) $C_{20}H_{32}O_7$ = 384.2. A hydrolysis product of (1). Cf. *senegenin.*

seneski. A natural coke resulting from the intrusion of igneous basaltic rock into a coal seam. It contains 20 % ash, and is used to produce water gas.

senna. The dried leaflets of *Cassia acutifolia* (Alexandria s.) or *Cassia angustifolia* (India s.), a leguminous plant. It contains glucosides, acids and resins; used as the fluid extract, as a cathartic. **American-** The leaves of *C. marilandica.* **wild-** See *globularesin.*

sennatin. An active principle from senna leaves.

sensibilizer. (1) An agent that renders an enzyme active. (2) An amboceptor.

sensitive. (1) Responding readily to a test or force. (2) See *anaphylaxis.*

sensitiveness. (1) The degree of accuracy of a test or instrument; the most exacting conditions under which it responds. (2) The speed with which light acts on a photographic plate. (3) The property of explosives to explode by mechanical shock.

sensitization. (1) In biochemistry, the process of rendering a cell sensitive to the action of a complement by treating it with a specific amboceptor. (2) In photography: (a) the coating of a surface with light-sensitive emulsions; as, silver salts; (b) rendering the photographic emulsion more sensitive by the addition of dyes which absorb certain portions of the spectrum. (3) The treatment or impregnation of paper with chemicals in such a way that ink writing cannot be eradicated without producing a telltale stain or mark.

sensitizer. (1) A trace of a substance, other than the catalyst, which promotes a catalytic action. (2) In biology: Amboceptor, opsonin, or tropin. A specific substance which occurs in small quantities in serum, and in larger quantities during immunization. Cf. *Ehrlich side-chain theory.* (3) In photography, an aniline dye that increases the sensitiveness of the emulsion to certain lightwaves. See *photosensitizer.*

separating fluid. A liquid used to separate materials of different density, q.v.

separator. A device or machine for separating materials of different densities by the aid of air or water. It differs from a concentrator in that the latter saves one material and rejects the rest; whereas, the separator saves both materials. (See *centrifuge, electric precipitator accumulator.*)

separatory funnel. A tap-funnel or device for separating two immiscible liquids (see illustration).

sepia. The dried inky juice of a cuttlefish or squid; used as a pigment or dye. Cf. *chromogen.*

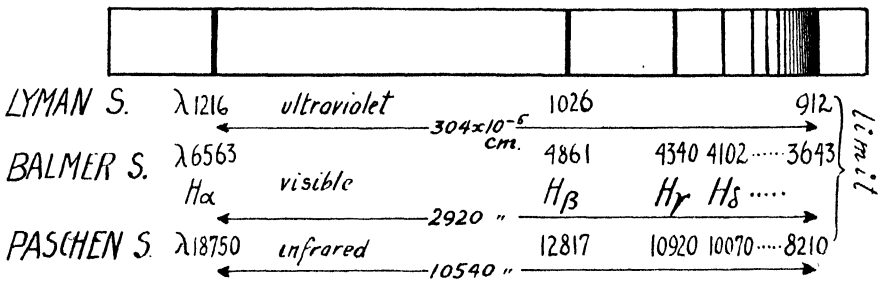
Separatory funnel.

sepiolite. A native hydrated magnesium silicate similar to meerschaum (q.v.).
sepsine. $C_5H_{14}N_2O_2$ = 134.1. A ptomaine from decaying yeast.
sepsis. Poisoning produced by microorganisms or putrefactive substances. Cf. *asepsis.*
septavalent. Septivalent, heptavalent. Possessing a valency of seven; as Cl in perchlorates, Mn in permanganates.
septic. Pertaining to putrefaction.
septicemia. Blood poisoning. A morbid condition caused by the presence of pathogenic bacteria and their waste products in the blood.
septivalent. Septavalent.
septurit. A molecular compound of sulfanilamidine and hexamine. Used to treat infected wounds.
sequiatannic acid. Sequoia tannin.
sequoia tannin. $C_{21}H_{20}O_{10}$ = 432.2. A tannin from the cones of *Sequoia gigantea*, the mammoth tree of California. A red-brown powder, soluble in water or alcohol.
seralbumin. The albumin of the blood.
serendipty. Intelligent curiosity. Ability to make unexpected discoveries.
serenoa. Sabal.
serge blue. Methylene blue.
sericin. $C_{15}H_{25}O_8N_5$ = 323.5. Silk gelatin, silk glue. An amorphous substance obtained from silk, q.v.
sericite. A flaky form of muscovite, causing silicosis.
series. A succession or a group of compounds, objects or numbers, arranged systematically according to a rule. See *progression.* **aliphatic-** See *aliphatic compounds.* **alkane-** See *methane s.* **alkene-** See *ethylene s.* **alkine-** See *acetylene s.* **analogous-** See *analogs.* **aromatic-** See *aromatic compounds.* **Balmer-** The hydrogen lines, H_α, H_β, H_γ . . . , which correspond with an electron transition from the third, fourth, fifth, . . . , orbit to the second orbit. Cf. *hydrogen atom, Bohr theory.* **benzene-** See *benenze series.* **chemical-** See *s. of compounds.* **diffused-** The spectrum lines resulting from a transition from the p state to the d state; they are denoted by 1p-md, where m is the integer denoting the order in the series. **displacement-** q.v. **electrical-** (1) See *electromotive force.* (2) See *s. of cells.* **ethylene-** See *olefines.* **fatty-** See *methane series.* **fuzzy-** The spectrum lines caused by transit from the outermost or f orbit, q.v. **galvanic-** See *galvanic battery.* **geologic-** See *geologic era.* **homologous-** A group of compounds differing from one another by a definite radical or atomic group; as, CH_2. **homotopic-** The elements in a group or family of the periodic system. **isologous-** See *isologous.* **isotopic-** The isotopes of an element. **isomorphous-** See *isomorphism.* **isotropic-** See *isotopes.* **isosteric-** See *isosteres.* **K-** See *K radiations.* **Lyman-** The hydrogen lines in the ultra-violet portion of the spectrum, due to a transition of electrons from the second, third, . . . orbit to the first orbit. Cf. *energy levels.* **methane-** See *methane series.* **Paschen-** The hydrogen lines in the infra-red portion of the spectrum, due to a transition of electrons from the fourth, fifth, . . . orbit to the third orbit. Cf. *energy levels.* **periodic-** See *periodic system.* **principal-** The spectrum lines caused by a transition from the p state to the lowest or s state; it is denoted by 1s-mp, where m indicates a particular line in the series; as 1s-3p; the third line. Some of these lines are produced by a bunsen flame. Cf. *Rydberg's formula, Bohr atom, orbital state, spectrum.* **radioactive-** See *radioactive elements.* **sharp-** The spectrum lines produced by an electronic transition from the p state to the s state; they are denoted by 1p-ms.

s. notation. See *quantum numbers.* **s. of cells.** A galvanic or electric s. in which the electric cells are arranged successively so that the anode of one is connected with the cathode of the other:

$$+ - <> - <> - <> - -.$$

It differs from connection in "parallel." **s. of compounds.** A group of compounds of an element, whose valency is the same throughout. Thus, elements that possess more than one valency form a corresponding number of series of compounds; *e.g.*, iron forms the ferrous and ferric series of salts, sulfur forms the sulfide, sulfite or sulfate series of compounds. **s. of lines.** See *Balmer-, Lyman, Paschen s., quantum theory, atomic structure, Ritz formula.*



Hydrogen spectrum showing series of lines.

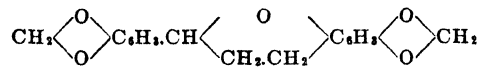
serine. $C_3H_7NO_3$ = 105.1. α-Amino-β-hydroxypropionic acid, hydroxyalanine, $CH_2OH.CHNH_2.COOH$. A colorless crystalline powder from sericin and horn. It is a constituent of many proteins, m.246 (decomp.), insoluble in alcohol or ether.
serogan. The follicle-stimulating sex hormone from pregnancy urine.
serology. The study of immunity reactions in serum; or the action of sera.
seroreaction. A reaction which occurs in a serum as a result of immunization.
serozyme. Thrombogen.
serpentaria. Virginia snakeroot. The dried rhizome and roots of *Aristolochia serpentaria* and other species of the Aristolochiaceae family; used medicinally as a tonic and stimulant.
serpentine. $Mg_3Si_2O_7.2H_2O$. A hydrous magnesium silicate; green massive or lamellar oxides. in rocks. It often contains ferrous masse. Cf *ophiolite.*

serum. [plural: sera.] (1) The clear liquid portion of a body fluid. (2) The clear, amber, alkaline fluid of the blood from which the cellular elements have been removed by clotting. It contains the salts, soluble proteins and carbohydrates; used in biochemical and therapeutic work. (See *immune serum, normal serum, immunity.*) **milk-** Whey.

s. albumin. A protein, molecular weight 45,000, from s. and nephritic urine. **s. globulin.** A protein closely associated with s. albumin.

sesame oil. Benne oil. The oil extracted from the seeds of *Sesamum indicum* and other species, Pedaliaceae, d_{25}°0.917; used as an olive oil substitute. Cf. *bromipin, iodipin, Villavecchia* test.

sesamin. $C_{18}H_{16}O_6$ = 312.0. The aromatic ether:



Colorless crystals, d.1.305, m.122.7, slightly soluble in alcohol. Sesame oil contains 1 % of s.

sesamol. $C_7H_6O_3$ = 138.1. A phenolic hydrolysis-product of sesamolin; it is responsible for the Baudouin color test.

sesamolin. $C_{20}H_{18}O_7$ = 450.1. A substance in sesame oil (0.3 %), m.93.6, which hydrolyzes to sesamol and samin.

sesqui- A prefix derived from the Latin and indicating "one and one-half"; *i.e.*, the proportion of two of one radical or element to three of another.

sesquicarbonate. A compound of carbonic acid and a base in the proportion of three to two, *i.e.*, an acid salt of carbonic acid. **s. of soda.** $NaHCO_3.Na_2CO_3.2H_2O$. Sodium sesquicarbonate. Snowflake crystals. The double salt, used extensively in industry as a neutralizing agent, in the manufacture of soap, glass, paper and cleansers.

sesquichloride. A compound of chlorine and metal in the proportion of three to two; as, Fe_2Cl_3.

sesquioxide. A binary compound of oxygen and a metal in the proportion of three to two; as, Al_2O_3, Fe_2O_3.

sesquisalt. A compound of an acid and base in the proportion of three to two: as, $Fe_2(SO_4)_3$.

sesquisoda. A molecular mixture of $NaHCO_3$ and Na_2CO_3.

sesquiterpenes. A group of terpenes of the general formula, $C_{15}H_{24}$ or $(C_{10}H_{16})_2$; as, cadinene, clovene, santalene.

SESQUITERPENES

$C_{15}H_{24}$	atractylene	gujene
	cadinene	patschoulene
	cannibene	santalene
	caryophyllene	selinene
	cedrene	zingiberene
	clovene	
$C_{15}H_{26}$	elemene	ferrulene

set-off. The transfer of ink from a printed to an unprinted surface by direct contact; it arises from the slow drying of the ink.

setting. The hardening of semi-liquid mixtures on crystallization (as cement or plaster of paris), n condensation (as organi mixtures).

settler. A separator or tank in which insoluble material from a solution is deposited and sinks to the floor.

settling. The precipitation of insoluble materials held in suspension in a liquid, and their gradual accumulation at the bottom of the vessel by gravitation. **hindered-** S. which is prevented by some factor other than specific gravity **rate of-** The velocity of fall of particles in a liquid. If the solid falls so slowly that the liquid flows past it in stream lines, the velocity is expressed by Stokes' law. If the particle is large and causes eddying motion in the liquid, the velocity, v, is expressed by:

$$v = k\frac{\sqrt{D(S-s)}}{s},$$

where D is the diameter of the particle, S and s the specific gravity of solid and liquid, respectively, and k a constant (9.3 for spheres, 9 for irregular particles). Cf. *Stokes' law.*

set-up. The working arrangement of instruments, glass-ware and other implements properly connected and ready for the performance of a chemical experiment or determination.

sewage. The domestic waste from lavatories, kitchens, bathrooms, stables, and industrial plants.

sewerage. A system of pipes for carrying off excreta and waste-materials.

sewer gas. The gases arising from decomposition of sewage.

sexiphenyl. $C_{36}H_{26}$ = 458.2. Hexaphenyl, a hydrocarbon which consists of a chain of six benzene rings, $Ph(C_6H_4)_4Ph$. Colorless crystals, m.475, b.350; insoluble in water.

sexivalent. (1) Having six different valencies. (2) Hexavalent.

sextate. Methyl cyclohexanol acetic ester.

sextol. Cyclohexanol.

seybertite. A complex hydrated native iron, calcium, aluminum silicate.

sfax. A variety of esparto (q.v.) from North Africa, near Sfax.

shale. A fine-grained sedimentary rock, with splintery uneven fractures. Cf. *slate.* **alum-** q.v. **oil-** q.v. **s. naphtha.** A petroleum obtained from shale. **s. oil.** A crude oil obtained from bituminous shales by destructive distillation. Its chief constituent is *kerogen.* Cf. *oil shale, gabianol.* **Esthonian-** Kukersite. **s. spirit.** The lower-boiling fractions obtained on distilling shale oil.

shallu. Durra.

shearing. Side-cutting or a lateral motion; as in grinding. (Differing from a vertical motion, as crushing.)

sheave. A grooved pulley-wheel.

sheep. The herbiverous mammal, *Ovis aries*, providing, meat, wool, leather and endocrine glands. **s. dip.** An antiseptic dipping fluid for sheep. It usually contains arsenic or phenols and cresols. **s. laurel.** Kalmia. **s. sorrel.** The dried herb of *Rumex acetosella;* used medicinally, as the fluid extract, as a refrigerant and diuretic.

sheerness. The combined qualities of transparency, surface gloss and smoothness, as applied to rayon articles.

Sheffield plate. Copper goods plated with a thicker layer of silver than for electroplate. A sheet of silver is laid on a sheet of copper, and both are fused together by heat. The silver-

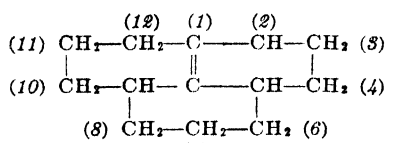
surfaced copper is then rolled out and worked into articles of desired forms. The art was discontinued on the discovery of electroplating in 1837.

shell. (1) A husk of a fruit. (2) The calcareous or siliceous covering of marine invertebrates. (3) A projectile filled with explosives. (4) An area surrounding an atomic nucleus in which electrons are situated. Cf. *Lewis atom, periodic chain.* **s. lime.** A fertilizer obtained by grinding mollusks containing 90 % $CaCO_3$ (or $MgCO_3$). **s. marl.** A fertilizer obtained by grinding natural deposits of shells containing not less than 80 % $CaCO_3$ (or $MgCO_3$).

shellac. The purified resin lac. (q.v.) obtained from various plants by the incisions of an insect, *Laccifer lacca* (*Coccus lacca*). Thin, yellowish-brown leaflets, insoluble in water, soluble in alcohol; used extensively in varnishes, polishing materials, sealing wax, and in pyrotechnics. It contains 30 % aleuritic acid and 35–38 % resin acid mixture. **earth-** Acaroid resin.

shellane. (1) A compressed natural gas, shipped in cylinders as fuel. (2) $C_{13}H_{22}$ = 178.1. The saturated hydrocarbon corresponding with shellene.

shellene. $C_{13}H_{20}$ = 176.1. The hydrocarbon



shellolic acid. $C_{15}H_{20}O_6$ = 296.14. *10*-Hydroxyshellene-*1.12*-dicarboxylic acid. Colorless crystals, m.200, decomp. 203, soluble in hot water or alcohol.

shepherd's purse. The freshly-gathered green herb of *Capsella Bursa-pastoris*. Used medicinally as a stimulant, as the fluid extract.

sherardize. To galvanize articles by covering them with zinc dust and heating in a tightly-closed retort. Cf. *calorizing.*

sherbet. (1) An effervescing drink, sold in powder form, consisting of sugar, sodium bicarbonate, tartaric acid and flavoring materials. (2) A frozen fruit-juice used as a dessert.

Sherman settler. A series of cylindrical tanks which, as they decrease in depth, increase in width. Used for settling out suspended materials from liquids.

shibuol. $C_{14}H_{20}O_9$ = 332.15. A phenol obtained from kaki shibu, the unripe kaki fruit of Japan. Used in water-proofing paper.

shift. (1) A slight change in the wave length of a spectral line caused by: (a) density (cf. *pressure*), (b) mass (cf. *relativity*), (c) motion (cf. *Döppler effect*), (d) absorption (cf. *Compton effect*), (e) reflection (cf. *Raman effect*). (2) A change of workers.

shikimol. Safrole.

shikonin. $C_{16}H_{16}O_5$ = 288.11. A principle from shikon, the dried root of *Lithospermum erythrorhizon*, a Boraginaceae of Japan.

shilajatu. A mineral gum from India.

shipping. The transporting of materials. Many chemicals, especially those of low melting point, spoil in warm weather and must be kept cool, as, $CaCl_2$, menthol, salol, *p*-dichlorobenzene. Others dry out and lose weight; as, crystalline Na_2CO_3, Na_2SO_4, and Na_3PO_4. **s. container.** A vessel for storing or shipping a solid, liquid, or gas. The principal containers are made of:

GLASS—sealed tubes, vials, ampoules, bottles, carboys.

METAL—lead-tubes, tins, metal cans, canisters, drums, barrels, steel cylinders, tank cars, lead carboys.

WOOD—boxes, kegs, barrels.

PAPER—paper bags, cartons, cardboard boxes, cardboard cylinders.

CERAMICS—earthen jugs, stone jars.

TEXTILES—burlap bags, burlap sacks.

PARAFFIN—bottles.

HARD RUBBER—bottles, cylinders.

s. rules. The regulations governing the transport of dangerous chemicals. See *hazard, labels.*

shirlacrol. A solution of phenolic tars and sodium hydroxide, used as a wetting agent in the textile industry.

shirlan. A mildew-preventive for textiles, 30 times as powerful as zinc chloride, but harmless to the cloth and to humans. It was evolved at the Shirley Institute, q.v.

shirlastain. A stain evolved by the Shirley Institute (q.v.) for distinguishing various textile fabrics. *E.g.*, cotton, blue; jute, brown; ramie, lavender; acetate rayon, green; wool, yellow; silk, orange.

Shirley Institute. The headquarters of the British Cotton Industry Research Association, near Manchester.

shock. (1) A violent collision between bodies; or the concussion it occasions. (2) The effect of an electric discharge on the animal body.

shoddy. Wool waste.

shogaol. $C_{17}H_{24}O_3$ = 276.19. 4-Hydroxy-3-methoxy-phenylethyl-heptenyl ketone. The pungent principle of ginger, resembling zingerone in having OH, OMe and CO groups. A colorless liquid, d.1.04, b.$_{15mm}$235; soluble in water or alcohol.

Shore hardness. The height of rebound of a diamond-pointed hammer falling under gravity on an object. It is measured on an empirical scale, with a high-carbon steel taken as 100.

short circuit. An electric current which passes directly between leads or wires which touch at a point between the source of current and its destination.

shorthand. See *structure symbols.*

shortite. $Na_2CO_3.2CaCO_3$. A pyroelectric crystalline mineral from Wyoming.

shotgun pattern. The irregular points on a diagram which, instead of coinciding with a theoretical curve, are unevenly distributed.

shoyu. The aromatic principle of fermented koji. It contains phenolic compounds, and is used as flavoring agent.

shunt. An alterable resistance connected in parallel with a galvanometer or other circuit, and used to control the current passing through it by diverting or "shunting."

Si. The symbol for silicon.

sial. [Contraction of Si and Al]. A hypothetical solid or semi-solid rock substance on which the land masses of the earth are assumed to be supported. Cf. *sima.*

sialagogue. An agent that increases the flow of saliva.

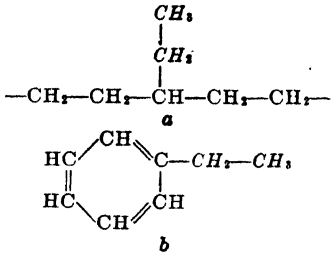
siaresinolic acid. $C_{30}H_{46}O_4$ = 470.4. A resin acid, $C_8H_7.C_{26}H_{39}O_2.COOH$, from Siamese benzoin gum, m.260, soluble in alcohol.

sibucao. Sappan wood.

sibucara. The bark of an unknown tree of Venezuela.

siccative. Drier. A solution of lead-manganese or zinc salts of resin acids. It is added to varnish or paints to quicken their drying.

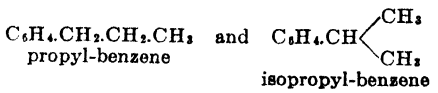
side-chain. A group of two or more similar atoms, generally carbon atoms, that branch off from a ring of atoms or a longer chain of atoms:



a

b

For type *a* the term, "branched chain," is preferable, restricting "side-chain" to type, *b*. Cf. *chain, Ehrlich's theory, protoplasm.* **s. isomery.** The isomery of a set of molecules that differ in structure by reason of a different arrangement of the atoms in the sidechain; as,



$C_6H_4.CH_2.CH_2.CH_3$ propyl-benzene and $C_6H_4.CH(CH_3)_2$ isopropyl-benzene

s. substitution. A reaction in which substitution takes place in the side-chain of the molecule. **s. theory.** See *Ehrlich's theory.*

side-cut. A distillate obtained by fractional distillation.

side reaction. Simultaneous but subsidiary reaction.

siderazote. Fe_6N_2. A volcanic incrustation.

sidereal. Pertaining to the fixed stars. Cf. *solar, lunar.* **s. day.** (86164.1 seconds) q.v. **s. year.** (365 d., 6 hrs. 9 min. 9 sec.) q.v.

siderite. (1) $FeCO_3$. Clay iron stone, chalybite, spathic iron ore, a native iron carbonate. (2) An iron meteorite. A body of metallic iron with Ni, Co, etc., which has fallen to earth from outer space.

siderocyte. A blood cell containing iron.

siderography. (1) The study of the natural surface condition of siderites. (2) The etching of steel and iron, and its microscopic study.

siderolite. Mesoderite. A meteorite consisting of spongy meteoric iron, with embedded grains of silicate minerals, such as chrysolite.

siderology. Siderurgy.

sideroplesite. A form of bruennerite.

siderosis. Damage to lungs due to exposure to dusts containing iron or steel.

siderostat. An instrument to transmit a beam of light along the optical axis of a fixed horizontal telescope.

siderotilate. $FeSO_4.5H_2O$. A native ferrous sulfate.

siderurgy. Siderology. A branch of science that deals with the metallurgy of iron.

sidonal. Piperazine quinate.

Sidgwick, Nevil Vincent. 1873– . An English physical chemist, noted for his electronic theory of valency.

Sidot's blende. An artificially-prepared zinc sulfide, which contains traces of copper; used in fluorescent screens for x-rays or radioactive rays.

Siegbahn, Karl Manne Georg. A Swedish physicist, noted for his work on crystal structure. **S. notation.** See *quantum numbers.*

Siemens, Carl Friedrich von. 1872– . A German industrialist. **S., Karl Wilhelm.** 1823–1883. A German chemist, and inventor of the S. process, q.v. **S. furnace.** A reverbatory furnace, heated by gas. **S.-Halske process.** A method for recovering copper by dissolving copper sulfides in a solution of ferrous sulfate and sulfuric acid, and obtaining the metallic copper by electrolysis. **S.-Martin process.** A method for producing steel in a reverbatory furnace by adding scrap iron to iron ores. **S. ozonizer.** Two concentric glass tubes, the outer covered and the inner lined with tin foil, which act as electrodes for a silent discharge passed through the stream of oxygen flowing between them. **S. process.** A method for making wrought iron directly from iron ores. **S. producer.** A furnace used in the manufacture of producer gas.

sienna. A brownish-yellow clay used as a permanent pigment. It contains hydrated ferric oxide and manganic oxide. **burnt s.** A burnt form of sienna, which is richer and brighter in color than s.

sieve. An apparatus with square apertures, used to separate particles according to size. Cf. *screen* (round holes).

sigma. A letter of the Greek alphabet. σ. The one-thousandth part of a second. **S. reaction.** Σ test. The Wassermann test for syphilis.

Sikes' hydrometer. See *hydrometer.*

sikimin. $C_{10}H_{16}$ = 136.1. A terpene in the leaves of *Illicium religiosum*, the sikimi plant of Japan, a Magnoliaceae. Cf. *staranise.*

silage. A fodder made of finely-cut green plants packed tightly in tanks (silos) and fermented.

silanes. Silicans, q.v., silicohydrides, hydrosilicons. A group of compounds similar to hydrocarbons in which tetravalent silicon replaces the carbon atom; as,

SiH_4—monosilane, silicomethane
Si_2H_6—disilane, silicoethane
Si_3H_8—trisilane, silicopropane
Si_4H_{10}—tetrasilane, silicobutane

Silanes are very reactive, ignite in air, and form derivatives; as, $SiHCl_3$, trichlorosilane or silicochloroform.

silanol. Silicol.

silbamin. Silver fluoride.

Silesia explosive. A high explosive consisting of 75 % $KClO_3$ and 25 % nitrated resin.

silex. A heat-and-shock-resistant glass containing 98 % quartz. **liquid-** Waterglass.

silfos. An alloy, m.625–705, of 80 % Cu, 15 % Ag and 3 % P; used for brazing alloys containing copper.

silica. SiO_2 = 60.1. Silicon dioxide, silicic acid anhydride. It occurs abundantly in nature (12 % of all rocks), and exists in 7 crystalline forms:

Stable		Transition °C
below 870°C..	quartz	573° $\alpha \rightleftharpoons \beta$
below 1470°C..	tridymite	117° 163° $\alpha \rightleftharpoons \beta_1 \rightleftharpoons \beta_2$
above 1470°C..	cristobalite	200–273° $\alpha \rightleftharpoons \beta$
	1200°	
also: quartz ⟷ cristobalite		

The many silica minerals may be grouped into: (1) Phenocrystalline or vitreous minerals (see *quartz*). (2) Cryptocrystalline and amorphous minerals (see *chalcedony*). (3) Amorphous and colloidal minerals (see *opal*). **amorphous-** A colorless powder, d.2.30, m.1650; insoluble in water or alcohol, soluble in hot alkalis or hydrofluoric acid; used for chemical glassware. **colloidal-** See *silicic acid*. **crystalline-** Colorless hexagonal, transparent prisms, $d_{.16°}$2.660 m.-1760, insoluble in water, alcohol, alkalis or acids, soluble in hydrofluoric acid. Used in optical instruments, and for chemical glassware as a platinum substitute. The main crystalline forms (quartz, tridymite and cristobalite) have definite transition points, (870°C. and 1470°C., respectively).

s. brick. A fire-brick containing over 92 % s.; its crystalline phase is cristobalite and tridymite. **s. gel.** A gelatinous form of silica which, if activated, absorbs water; used to dry blast-furnace gases, air, and other gases. **s. minerals.** A group of rock-forming minerals:

quartz, tridymite.... SiO_2

Feldspar group

orthoclase..... $KAlSi_3O_8$
albite..... $NaAlSi_3O_8$—Ab
anorthite..... $CaAl_2Si_2O_8$—An

The composition of other rocks is indicated by the proportion of Ab and An; as,

oligoclase..... Ab_3An_1 to Ab_3An_1
andesine..... Ab_2An_1 to Ab_1An_1
labradorite..... Ab_1An_1 to Ab_1An_2
bytownite..... Ab_1An_2 to Ab_1An_6

Leucite group

leucite..... $KAlSi_2O_6$
analcite..... $NaAlSi_2O_6$

Nephelite group

nephelite..... $NaAlSiO_4$
kaliophylite..... $KAlSiO_4$
eucryptite..... $LiAlSiO_4$

Cancrinite-sodalite group

cancrinite..... $Al_3Na_4HCSi_3O_{15}$
sodalite..... $Al_3Na_4ClSi_3O_{12}$
hauynite..... $Al_3Na_3CaSSi_3O_{16}$
noselite..... $Al_3Na_2SSi_3O_{16}$

Pyroxene group

enstatite..... $MgSiO_3$
hypersthene..... $FeSiO_3$
wollastonite..... $CaSiO_3$
diopside..... $CaMgSi_2O_6$
hedenbergite..... $CaFeSi_2O_6$
acmite..... $NaFeSi_2O_6$
jadeite..... $NaAlSi_2O_6$
spodumene..... $(Li, Na)_2\ AlSi_2O_6$

Amphibole group

anthophyllite..... $(Mg, Fe)SiO_3$
tremolite..... $CaMg_3Si_4O_{12}$
glaucophane..... $NaAlSi_2O_6.FeSiO_3$

Olivine group

forstérite..... Mg_2SiO_4
fayalite..... Fe_2SiO_4
monticellite..... $MgCaSiO_4$
glaucochroite..... $CaMnSiO_4$

Mica group

muscovite..... $Al_3KH_2Si_3O_{12}$
paragonite..... $Al_3NaH_2Si_3O_{12}$
lepidolite..... $AlR_3F_2Si_3O_8(Li,K)$
biotite..... $Al_3Mg_3KHSi_3O_{12}$
phlogopite..... $AlMg_3KH_2Si_3O_{12}$
choritoid..... $Al_2FeH_2SiO_7$

Chlorite group

A number of minerals of the type, $Al_2(MgOH)_4(SiO_4)_3$ and $Al(MgOH)_6H_3(SiO_4)_3$.

Melilite group

melilite..... $(Al,Fe)_2(Ca,Mg)_3Si_2O_{10}$
gehlenite..... $Al_2Ca_2Si_2O_{10}$
akermanite..... $Ca_4Si_3O_{10}$
sarcolite..... $Al_2(Na_2Ca)_3Si_3O_{12}$

Garnet group

grossularite..... $Ca_3Al_2Si_3O_{12}$
pyrope..... $Mg_3Al_2Si_3O_{12}$
almandite..... $Fe_3Al_2Si_3O_{12}$
spessartite..... $Mn_3Al_2Si_3O_{12}$
garnet..... $Ca_3Fe_2Si_3O_{12}$
uvarovite..... $Ca_3Cr_2Si_3O_{12}$
lagoriolite..... $Na_6Al_2Si_3O_{12}$

Scapolite group

melonite..... $Ca_4Al_6Si_6O_{25}$
marialite..... $Na_4Al_3Si_9O_{24}Cl$

Iolite group

iolite..... $H_2(Fe,Mg)_4Al_8Si_{10}O_{36}$

Zoisite group

zoisite..... $HCa_2Al_3Si_3O_{13}$
epidote..... $HCa_2(Al,Fe)_3Si_3O_{13}$
piedmontite..... $HCa_2(Al,Mn)_3Si_3O_{13}$

Topaz group

topaz..... $Al_2SiO_4F_2$

Andalusite group

andalusite..... Al_2SiO_5
sillimanite..... Al_2SiO_5
kyanite..... Al_2SiO_5

Tourmaline group

A group of borosilicates of aluminum and other bases of the average type, $Al_7M_3Si_6B_3O_{31}$. M is lithium or sodium, and sometimes potassium, in the alkali-tourmalines; magnesium, in the magnesium tourmalines; iron, in iron tourmalines.

Zeolite group

heulandite..... $CaAl_2Si_6O_{16}.5H_2O$
stilbite..... $(Na_2,Ca)Al_2Si_6O_6.6H_2O$
laumontite..... $CaAl_2Si_4O_{12}.4H_2O$
chabazite..... $CaAl_2Si_4O_{12}6H_2O$

Miscellaneous group

beryl..... $Al_2Be_3Si_6O_{12}$
serpentine..... $H_4Mg_3Si_2O_9$
talc..... $H_2Mg_3Si_4O_{12}$

silicam. $Si_2N_3H_2$ = 100.2. A white powder obtained by heating silicon imide, $Si(NH)_2$. Insoluble in water, and forms silicon nitride, Si_2N_4, when further heated.

silicane. (1) A silane; that is, a compound of the type Si_xH_y. (2) An organic compound of the type SiR_4, where R is a hydrocarbon radical. (3) SiH_4 = 32.08. Monosilane, silicomethane, silicohydride. A colorless gas, m.--185, b.—112. **bromo-** SiH_3Br = 111.0. A colorless gas, $d_{-80°}$.1.72, m.94, b.1.8. **chloro-** SiH_3Cl = 66.54. A colorless gas, $d_{-112°}$.1.145, m.—118, b.—30.4. **di-** Si_2H_6 = 62.16. Silicoethane, a gas, m.—132. **dibromo-** SiH_2Br_2 = 189.91. A colorless liquid, d.2.17, m.—70.1, b.66. **dichloro-** SiH_2Cl_2 = 100.99. A colorless gas, $d_{-112°}$.1.42, m.—122, b.8.3. **dimethyl-** SiH_2Me_2 = 60.12. Dimethylmonosilane. Colorless gas, $d_{-80°}$.0.68, m.—150, b.—20. **ether-** $(SiH_3)_2O$ = 78.17. Disilaneoxide. A colorless gas, $d_{-80°}$.0.881, m.—143.5, b.15.2. **ethoxytriethyl-** Et_3SiOEt = 160.22. Triethylsilane ethyloxide triethylsilicol ethylether. Colorless liquid, d.0.8403, b.153, insoluble in water. **hydroxy-** Silicol. **methyl-** $MeSiH_3$ = 46.11. Methylmonosilane. Colorless gas, $d_{-87°}$.0.62,

m. −156.5, b. −56.8. **tetra-** Si_4H_{10} = 122.31. Silicobutane. A gas, m. −93.5. **tetrabromo-** Silicon bromide. **tetrachloro-** Silicon chloride. **tetraethyl-** $Si(C_2H_5)_4$ = 144.25. Silicon tetraethyl, siliconononane, $SiEt_4$. A colorless liquid, d.0.7682, b.153. **tetrafluoro-** Silicon fluoride. **tetraiodo-** Silicon iodide. **tetramethyl-** $SiCH_4$ = 144.22. Silicon tetramethyl, $SiMe_4$. Colorless liquid, d.0.645, b.27. **tetraphenyl-** $Si(C_6H_5)_4$ = 336.24. Silicon tetraphenyl, tetraphenylsilicon, $SiPh_4$. Colorless crystals, m.-233. **tri-** Si_3H_8 = 92.24. Silicopropane. A gas, m. −117. **tribromo-** $SiHBr_3$ = 268.82. Silicobromoform. A colorless liquid, d.2.7, m. −80, b.109. **trichloro-** Silicochloroform. **trichloroethyl-** $Si(C_2H_5)Cl_3$ = 163.47. A colorless liquid, d.1.239. **trichlorophenyl-** $Si(C_6H_5)Cl_3$ = 211.47. A colorless liquid, d.1.326, b.197, decomp. in water. **triethyl-** $(C_2H_5)_3SiH$ = 116.18. Triethylsilicon, silicoheptane, $Si-Et_3H$. Colorless liquid, d.0.751, b.107, insoluble in water. **trifluoro-** $SiHF_3$ = 86.07 Silicofluoroform. A colorless gas, m. −110, b. −80.2. **triiodo-** SiI_3H = 409.83. Silicoiodoform. A red liquid, d.3.314, m.8, b.220.

silicate. A salt derived from silica or the silicic acids. They form, by far, the largest group of minerals (see *silica*), and are derived from the two types: M_4SiO_4—*ortho*silicate; M_2SiO_3—*meta*silicate, which may combine to form a number of *poly*silicates. With the exception of the alkali silicates, they are insoluble in water (see *silica minerals*). **s. cement.** See *dental* cement. **s. of soda.** Sodium silicate.

siliceous. Containing quartz or silica. **s. algae.** See *algae*. **s. deposit.** S. sinter. The solid accumulation of silica deposited from hot mineral springs or geysers. Cf. *geyserite, fluorite*. **s. sinter.** S. deposit.

silicic. (1) Containing silica or silicon. (2) Containing silicic acid. **s. acid.** H_4SiO_4 = 96.3. Ortho-silicic acid. Colorless, amorphous powder, d.1.576; slightly soluble in water. **di-** $H_2Si_2O_5$ or $H_6Si_2O_7$. A white insoluble powder. **meta-** H_2SiO_3 = 78.1. A white powder, d.1.813; insoluble in water, soluble in alkalis. **tri-** $H_4Si_3O_8$ = 216.3. A white insoluble powder.

SILICIC ACIDS

$\%H_2O$	$\%SiO_2$	
	↑	$H_2Si_4O_9$ = $4SiO_2.H_2O$, tetra-
		$H_2Si_2O_5$ = $2SiO_2.H_2O$, meta-di-

↓		H_4SiO_4 = $SiO_2.2H_2O$,,ortho-

silicide. A binary compound of tetravalent silicon and a metal; as, M_2Si, where M is Fe, Ni, Co, Cr, Mn, Cu, or Mg.

silicification. The gradual replacement of rocks or fossils by silica (petrifaction).

silicified. Describing an organic material (*e.g.*, wood) that has been converted into silica (petrified).

silicium. Silicon.

silico- A prefix indicating silicon, generally in organic compounds. **s. acetic acid.** $Me-SiOOH$ = 76.1. An insoluble solid. **s. benzoic acid.** $PhSiOOH$ = 138.1. A solid, m.-92; insoluble in water, soluble in alcohol or ether. **s. bromoform.** $SiHBr_3$ = 268.9. A heavy, colorless liquid, d.2.7, b.116; decomp. by water. **s. butane.** See *silanes*. **s. calcium.** A product of the electric furnace used to deoxidize steel. **s. chloroform.** $SiHCl_3$ = 135.36. A colorless liquid, d.1.34, m. −1.3, b.34; decomp. by water. **s. decitungstic acid.** $H_8SiW_{12}O_{36}$ or $SiO_2.10WO_3.4H_2O$. A white powder used as a reagent, as it forms insoluble cesium salts. **s. ethane.** Disilane (see *silanes*). **s. fluorides.** Fluosilicate. **s. fluoric acid.** Fluosilicic acid. **s. formic acid.** See *leucone*. **s. heptane.** Et_3SiH = 116.1. Triethylsilane. A colorless liquid, d.0.751, b.107. **s. hydrides.** Silanes. **s. iodoform.** $SiHI_3$ = 409.9. A colorless heavy liquid, d.3.4, b.220; decomp. by water. **s. methane.** Silane. **s. oxalic acid.** $Si_2O_4H_2$ = 122.2. $HOOSi.SiOOH$. A white, unstable solid. **s. tungstic acid.** S. decitungstic acid.

silicol. Hydroxysilan. A compound of the type R_3SiOH; as, **triethyl-** Et_3SiOH = 132.18. Silicoheptyl alcohol. A colorless liquid, d.-0.8709, b.154, insoluble in water.

silicon. Si = 28.06. Silicium. A non-metallic element of the carbon group, atomic number 14. It occurs in several allotropic modifications: (1) *amorphous* s. A brown powder, d.2.35. (2) *crystalline* s. A grayish-black crystalline powder, d.2.49, m.1500; insoluble in water, soluble in alkalis. (3) *graphitoidal* s. A dense crystalline form, or graphite-like masses deposited from molten silicon. (4) *adamantine* s. Needle-shaped crystals of silicon of extreme hardness. The principal valency of s. is four, and like carbon, it forms many complex compounds that are an essential part of the earth surface (rocks). See *silica minerals*. **ethyl-** The radical ≡SiEt, cf. *silicane*. **methyl-** The radical ≡SiMe. **radio-** The isotope of mass 27. Cf. *radioelements*.

s. alkyls. (1) A group of hydrogen compounds of silicon corresponding with the hydrocarbons; as, SiH_4, Si_2H_6 etc. See *silane*. (2) An organic compound of Si and alkyl radicals; as, $SiMe_4$, $SiEt_4$ etc. See *silicanes*. **s. alloys.** A group of non-corrosive alloys of silicon with metals; as, duriron, ironac, narki, silumin, and tantiron. Cf. *s. copper, s. steel, s. zirconium*. **s. borides.** The hard compounds SiB_3 and SiB_6. **s. bronze.** A noncorrosive alloy of silicon, copper, and tin. **s. bromides:** (1) $SiBr_4$ = 347.9. S. tetrabromide. A colorless fuming liquid, d.2.813, m. −12, b.154; decomp. by water to silicic acid and hydrobromic acid. (2) Si_2Br_6 = 535.7. S. tribromide. A colorless solid, b.240, decomp. by water. **s. carbide.** SiC = 40.1. Colorless rhombohedric plates, d.3.12; dissociates at 2250°C., but has no melting point. Cf. *carborundum, silundum, crystolon*. **s. chlorides:** (1) $SiCl_4$ = 170.0. S. tetrachloride. A colorless fuming liquid, d.1.524, m. −87, b.57.6; decomp. by water to silicic and hydrochloric acid. Used in electrotechnics, and mixed with ammonia vapors, in the production of smoke screens. (2) Si_2Cl_6 = 269.0. S. trichloride. A white solid, d_0°.1.58, m. −1, b.146, decomp. by water. (3) Si_3Cl_8 = 367.8. S. octachloride. A white powder. **s. copper.** An alloy of 20–30 % Si and 70–80 % Cu, used in metallurgy. **s. dioxide.** Silica. **s. disulfide.** SiS_2 = 92.2. White needles, which sublime when heated, decomp. by water. **s. ethane.** See *silanes*. **s. ethyl.** Tetra-

ethyl silicane (see *silicane*). **s. fluorides:** (1) SiF_4 = 104.3. S. tetrafluoride. A colorless, suffocating gas, $d._{(air=1)}$3.57, m. −77 (at 2 atm.), $b._{81\,0mm.}$ −65, decomp. by water to fluosilicic acid, soluble in alcohol or ether. (2) Si_2F_6 = 170.6. S. subfluoride. A white powder. **s. hydrides.** See *silanes*. **s. iodides:** (1) SiI_4 = 535.8. S. tetraiodide. A colorless solid, m.121, b.290; insoluble in water. (2) Si_2I_6 = 817.7. S. subiodide. A colorless solid, m.250 (in vacuo); decomp. by water. **s. iron.** Ferrosilicon. An iron that contains from 2 to 15 % silicon; used in metallurgy. **s. magnesium.** Mg_2Si = 76.7. Magnesium silicide. Gray leaflets of metallic luster, decomp. by water to silanes. **s. methane.** Silane. **s. methyl.** $SiMe_4$ = 88.3. A colorless liquid, b.26. **s. nitride.** Si_3N_4 = 140.2. A gray or white amorphous powder; insoluble in water. **s. octachloride.** See *s. chlorides*. **s. oxide.** Silica. **s. oxychlorides:** The liquids Si_2OCl_6 (b.137); $Si_4O_4Cl_8$ (b.200); $Si_4O_3Cl_{10}$ (b.153); $Si_8O_{10}Cl_{12}$ (b.300); $Si_2O_3Cl_2$ (b.400); and the solid $Si_4O_7Cl_2$ (m.400). **s. steel.** A steel that contains 2–3 % Si. It is hard, brittle, and difficult to work. **s. sulfide.** S. disulfide. **s. tetrabromide.** See *s. bromides*. **s. tetrachloride.** See *s. chlorides*. **s. tetrafluoride.** See *s. fluorides*. **s. tetraiodide.** See *s. iodides*. **s. tetraphenyl.** Tetraphenyl silicon. **s. tungstic acid.** Silico decitungstic acid. **s. zirconium.** An alloy used to purify molten steel.

silicone. $H_3Si_3O_2$ = 119.2. A yellow solid.

siliconic acid. A compound of the type R.SiOOH, analogous to organic acids. Cf. *carbylic acid*.

siliconize. To combine or mix with silicon or silica.

silicono. The monovalent radical, (HO)OSi—, derived from metasilicic acid.

silicotungstate. A salt of silicotungstic acid, especially with the alkaloids.

silicotungstic acid. $4H_2SiO_3.12WO_3.22H_2O$. $SiO_2.12WO_3.26H_2O$. Colorless or slightly yellow crystals, soluble in water or alcohol; used for the qualitative and quantitative analysis of alkaloids.

silicyl. (1) The monovalent radical H_3Si—, derived from silane. (2) The divalent radical, =SiO, derived from silicic acid. **di-** The divalent radical $=Si_2O_5$. **s. oxide.** A compound of the type $(R_3Si)_2O$; as, ***hexaethyl-*** $(Et_3Si)_2O$ = 246.35. A colorless liquid, d.0.859, b.231.

silicylene. The divalent radical, H_2Si=, from silane.

silk. (1) Fibroin, sericin. The fibrous material with which the silkworm envelops itself before passing into the chrysalis state (cocoon). It consists of fibroin (the fiber protein) and sericin (the gummy protein). The former yields on hydrolysis:

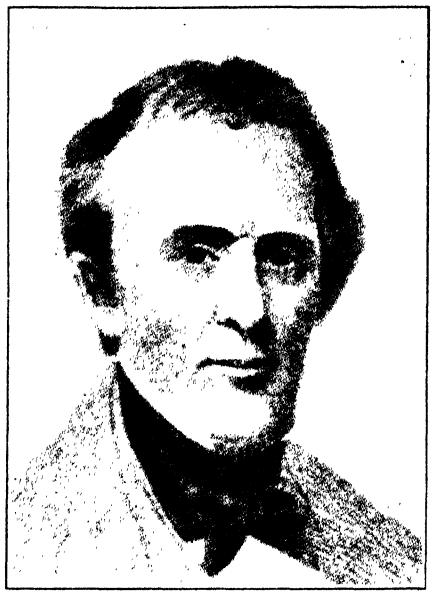
alanine	23.8 %
glycine	19.7 %
tyrosine	9.8 %
aspartic acid	2.9 %
proline	1.9 %
glutamic acid	1.7 %
leucine	1.6 %
phenylalanine	1.2 %
serine	1.0 %

(2) A sieve used for grading flour. No. 5 s. = 0.270, No. 8 s. = 0.190 mm. aperture. **artificial-** Rayon. **vegetable-** (1) The floss from the seeds of *Calotropis gigantea*, an Asclepiadaceae of Asia. (2) Kapok.

silkwarp. Organzine.

silkweed. Milkweed. The dried roots of *Asclepias syriaca*. Used medicinally, as the fluid extract, as a diuretic and tonic.

silky. Having the luster of silk.



Benjamin Silliman (The Elder).

Silliman, Benjamin. (1) 1779–1864. An American chemist and geologist, who founded the American Journal of Science and Arts. (2) 1816–1885. His son. An American inorganic chemist noted for his textbooks.

sillimanite. Al_2SiO_5. (1) A rhombic aluminum silicate, used for porcelain of superior quality, m.1820. Above 1545°C. it forms mullite and siliceous glass. See *cyanite*. (2) Fibrolite. **s. ware.** Laboratory utensils (dishes, crucibles, tubes, etc.) made of s. which have remarkable strength against mechanical and thermal shock.

Sillman bronze. An alloy of 86 % copper, 10 % aluminum and 4 % iron.

silo. (1) A tank or channel for conveying solid material in small pieces (such as coal), on the large scale. (2) A pit or chamber in which fodder is fermented. See *silage*.

siloxicon. Si_2OC_2. A refractory material obtained by heating quartz, carbon and sawdust in the electric oven. Cf. *fibrox*.

silumin. A non-corrosive alloy of silicon and aluminum, sometimes containing 4–5 % copper.

silundum. Silicon carbide.

silvan. Sylvan.

silver. Ag = 107.880. A metal of the gold family and element, atomic number 47. A white lustrous metal of regular crystalline structure, d.10.5, m.961, b.2570, soluble in nitric acid or hot conc. sulfuric acid, insoluble in hydrochloric acid, water, or cold sulfuric acid. Silver forms only one series of compounds and has a valency of one. It is used as metal in jewelry, coins and instruments; and in the manufacture of silver salts for photography and pharmacy. The World output in 1941 was

275,000,000 ounces troy, coming from Mexico (about half) > U. S. A. > Canada > Peru > Australia > Japan. **antimonial-** Dyscrasite. **black-** Stephanite. **blue-** Niello. **coinage-** See *s. alloys*. **colloidal-** Collargol. **fulminating-** S. nitride. **German-** q.v. **horn-** Argentum cornu. **liquid-** Mercury. **moss-** A native s. in moss-like form. **niello-** q.v. **nickel-** German s. **quick-** Mercury. **ruby-** Proustite. **Russian-** Mello.

s. acetate. $AgC_2H_3O_2$ = 166.9. Colorless crystals, d.3.259, decomp. by heat, soluble in water, or alcohol; used medicinally in ophthalmia. **s. acetylide.** Ag_2C_2 = 239.88. s. carbide. An explosive white powder. **s. alloys.** A mixture of silver with some other metal, principally:

coinage silver.
U. S.—Ag 90, Cu 10 %.
British—Ag 50, Cu 40, Ni 5, Zn 5 %.
jewelry silver.
ordinary—Ag 80, Cu 20 %.
hall-marked—Ag 92.5, other metals usually Cu and/or Cd 7.5 %.

The melting points of silver alloys are:

with	90 % Ag 10 %	80 % Ag 20 %	70 % Ag 30 %	60 % Ag 40 %	50 % Ag 50 %
Al	750°C	650°C	570°C	575°C	580°C
Au	982°C	1006°C	1025°C	1039°C	1040°C
Cd	940°C	895°C	850°C	805°C	760°C
Cu	875°C	814°C	788°C	830°C	870°C
Pb	905°C	840°C	775°C	705°C	650°C
Sb	850°C	680°C	545°C	505°C	500°C
Sn	870°C	750°C	630°C	550°C	495°C
Zn	850°C	755°C	705°C	690°C	660°C

s. amalgam. $AgHg_2$ = 509.1. A silvery, uneven, brittle solid. **s. ammonium chloride.** $AgCl.NH_4Cl$ = 196.9. Colorless cubes, soluble in ammonium hydroxide; used medicinally. **s. ammonium nitrate solution.** A test solution made by dissolving one gram of silver nitrate in 20 cc. of water and adding ammonia until the precipitate has just dissolved. It is then filtered, kept in amber bottles, and used for silvering, or the production of a silver mirror on heating with certain organic reducing agents. **s. antimonide.** S. stibide. **s. arsenate.** Ag_3AsO_4 = 462.6. A dark-red powder, d.6.66, insoluble in water and soluble in alcohol or alkalis. **s. arsenide.** Ag_3As = 398.4. A velvet-black precipitate, readily decomp. when dried. **s. arsenite.** Ag_3AsO_3 = 446.60. A yellow powder, insoluble in water; used medicinally as an antiseptic in skin diseases. **s. arsphenamine.** A compound of silver and salvarsan, used medicinally. **s. atoxylate.** $NH_2C_6H_4AsO.AgO.OH$ = 323.8. Argatoxyl, silver-p-aminophenylarsenate; used medicinally as a bactericide. **s. azide.** AgN_3 = 149.91. A curdy, white explosive powder (cf. *s. nitride*). **s. benzamide.** See *benzamide*. **s. benzoate.** $AgC_7H_5O_2$ = 228.8. A colorless powder; soluble in hot water, slightly soluble in alcohol. **s. bichromate.** S. dichromate. **s. borate.** $Ag_2B_4O_7$ = 371.0. An unstable white powder, soluble in ammonium hydroxide or cyanide solutions. **s. bromate.** $AgBrO_3$ = 235.8. Colorless tetragonal crystals, d.5.206, decomp. by heat; soluble in hot water, slightly soluble in alcohol. **s. bromide.** AgBr = 187.80. Native as bromyrite and embolite. A yellow powder or pale yellow regular crystals, d.6.473, m.427, decomp. 700; insoluble in water, alcohol or ether, soluble in cyanide, bromide, or thiosulfate solution. Used in photography as a light-sensitive coating on plates, films, and papers. **s. carbide.** S. acetylide. **s. carbonate.** Ag_2CO_3 = 275.8. A heavy yellow powder, d.6.0, decomp. 200; insoluble in water, soluble in cyanide or hydroxylamine solutions. **s. caseinate.** Argonin. **s. chlorate.** $AgClO_3$ = 191.3. Colorless, regular or tetragonal crystals d.4.21, m.230, decomp. 270; soluble in water or alcohol, insoluble in ether. **s. chloride.** AgCl = 143.34. Lunar cornea. Native as horn-silver, cerargyrite, embolite. Colorless regular crystals or white powder, d.5.553, m.455; insoluble in water or alcohol, soluble in ammonium hydroxide, cyanide or thiosulfate solutions. Used as an antiseptic and nerve sedative; in the manufacture of pure silver, and silver salts; for silver plating; and in photography and photometry. **s. chlorite.** $AgClO_2$ = 175.3. A yellow powder; slightly soluble in water. **s. chromate.** Ag_2CrO_4 = 331.8. Dark-red crystals, d.5.623; insoluble in water, soluble in ammonium hydroxide. **s. cinnamate.** $AgC_9H_7O_2$ = 254.8. Silver cinnamylate. A heavy white powder, slightly soluble in water or alcohol; used medicinally as an antiseptic. **s. cinnamylate.** S. cinnamate. **s. citrate.** $Ag_3C_6H_5O_7$ = 512.4. Itrol. An odorless, heavy, white powder, insoluble in water or alcohol; used medicinally as a non-irritant dusting-powder for wounds. **s. colloidal.** Collargol, argentum colloidale. An allotropic form of metallic silver, with a small percentage of albumin; black scales giving a fairly stable colloidal suspension with water. **s. cyanate.** AgCNO = 149.9. A colorless powder, d.4.0, decomp. by heat; slightly soluble in water, soluble in ether or nitric acid. **s. cyanide.** AgCN = 133.90. A white crystalline powder, d.3.99, decomp. by heat; insoluble in water or alcohol, soluble in cyanide, thiosulfate or ammonium salt solutions. Used medicinally as an antipyretic and sedative. **s. dichromate.** $Ag_2Cr_2O_7$ = 431.76. Purple, triclinic crystals d.4.67, decomp. by heat or alcohol, slightly soluble in water. **s. dithionate.** $Ag_2S_2O_6$ = 375.90. **s. eosolate.** The silver salt of trisulfoacetylguaiacol, $C_6H_5O—CH_2O—C_2H_3O.Ag_2(SO_3)_3$; used medicinally as an antiseptic. **s. ferricyanide.** $Ag_3Fe(CN)_6$ = 535.5. An orange-red crystalline powder; slightly soluble in water, soluble in ammonium hydroxide. **s. ferrocyanide.** $Ag_4Fe(CN)_6.H_2O$ = 661.4. A yellow crystalline powder, insoluble in water or alcohol, soluble in cyanide solutions. **s. fluoride.** AgF,H_2O = 144.90. Tachiol. Silbamin. Yellow or colorless, tetragonal, deliquescent crystals, soluble in water, d.5.852, m.435; used medicinally as a strong antiseptic, and to sterilize water. **s. fluosilicate.** (1) Ag_2SiF_6 = 249.94. A white powder. (2) $Ag_2SiF_6.4H_2O$ = 366.94. Globular granules, slightly soluble in water. **s. fulminate.** $Ag_2C_2N_2O_2$ = 299.8. Colorless, small needles which explode when

heated; slightly soluble in water, alcohol or ether. Used in the manufacture of detonators. **s. gelatose.** Albargin. **s. glance.** S. glanz. Argentite. **s. hypochlorite.** AgClO = 159.34. An unstable bleaching agent. **s. hyponitrite.** $Ag_2N_2O_2$ = 275.78. A yellow powder. **s. hypophosphate.** See *s. phosphates.* **s. iodate.** $AgIO_3$ = 282.80. Colorless monoclinic crystals, d.5.4, decomp. by heat; insoluble in water, slightly soluble in alcohol or ether. Used medicinally as an astringent and antiseptic. **s. iodide.** AgI = 234.8. Native as iodyrite. A yellow hexagonal crystalline powder, d.5.674, m.536, insoluble in water, soluble in cyanide, iodide or thiosulfate solutions; used in photography, and medicinally as an alterative. **s. lactate.** $AgC_3H_5O_3.H_2O$ = 214.8. Actol. Colorless crystalline needles or granular masses, soluble in water; used medicinally as an antiseptic and astringent. **s. laurate.** $AgC_{12}H_{23}O_2$ = 307.06. Colorless powder, m.212.5. **s. leaf.** Stillingia. **s. luster.** The appearance of an untarnished metallic s. surface. **s. methylene blue.** A compound of silver and methylene blue. A blue powder, soluble in water; used medicinally as a germicide and internal antiseptic. **s. myristate.** $AgC_{14}H_{27}O_2$ = 335.09. White powder, m.211, insoluble in water. **s. nitrate.** $AgNO_3$ = 169.9. Colorless hexagonal or rhombic crystals, d.4.352, m.209, decomp. by further heat, soluble in water, alcohol, or ether. Used as a reagent for detecting and determining halogens, aldehydes, chromic acid, arsenous oxide, hydrogen-peroxide, and many other compounds; also used medicinally as an antiseptic, in the manufacture of silver salts, for silver plating, in photography, for permanent laundry-proof markings, and for dyeing hair and fur. *fused-* Lunar caustic, molded silver nitrate. White hard sticks, used as an external antiseptic. **s. nitrate paper.** A filter paper impregnated with a solution of silver nitrate and dried in the dark. Used as a sensitive test paper for arsenic (yellow color), phosphorus (black color), chromates (red color) and uric acid (brown color). **s. nitride.** Ag_3N = 337.4. Fulminating s. A gray, explosive substance; insoluble in water, soluble in ammonium hydroxide. Cf. *s. azide.* **s. nitrite.** $AgNO_2$ = 153.9. A colorless crystalline powder, d.4.453, decomp. 150, slightly soluble in water, ammonia or alcohol. Used as a reagent in standardizing permanganate solutions, in determining nitrites and differentiating primary, secondary, and tertiary alcohols. **s. nucleinate.** Nargol. A compound of nucleic acids and silver. A light powder, used medicinally. **s. ores.** Silver is found in nature associated with copper and gold minerals and occurs generally in binary compounds, as:

native silver	Ag
argentite, acantite	Ag_2S
chilenite	Ag_2Bi
animikite	Ag_3Sb
dyscrasite	Ag_2Sb
huntilite	Ag_2As
naumannite	Ag_2Se
aguilarite	Ag_4SSe
hessite	Ag_2Te
smithite	$AgAsS_2$
proustite	Ag_3AsS_3
miargyrite	$AgSbS_2$
matildite	$AgBiS_2$
cucairite	AgCuSe
stromeyerite	AgCuS
sternbergite	$AgFe_2S_3$
cerargyrite	AgCl
bromyrite	AgBr
iodyrite	AgI
argentiferous lead	AgPbS

See also *embolite, hornsilver, polyargyrite.* **s. oxalate.** $Ag_2C_2O_4$ = 303.8. A white crystalline powder, d.5.029, detonating when heated; insoluble in water, soluble in nitric acid or ammonium hydroxide. **s. oxide.** Ag_2O = 231.8. A heavy, brownish-black powder, d.7.521, decomp. 330, insoluble in water and soluble in nitric acid; used medicinally as an antiseptic and tonic. **s. oxyquinoline sulfonate.** Argentol. **s. palmitate.** $AgC_{16}H_{31}O_2$ = 363.12. A white powder, m.209, insoluble in water. **s. perchlorate.** $AgClO_4$ = 207.3. A white crystalline powder, m.486, soluble in water or alcohol. **s. period.** A group of heavy metals of the fourth sub-period in the periodic system, Ru, Rh, Pd, Ag, Cd, and In. **s. permanganate.** $AgMnO_4$ = 225.8. Dark violet monoclinic crystals, decomp. by heat, slightly soluble in water or alcohol; used as an antiseptic. **s. peroxides.** (1) Ag_2O_2 = 247.76. A black insoluble solid, d.7.44, decomp. 110. (2) Ag_2O_4 = 279.76. An unstable solid. **s. phenolsulfonate.** $C_6H_4(OH)SO_3Ag$ = 280.9. S. sulfophenylate, s. sulfocarbolate. A colorless crystalline powder, soluble in water; used in ophthalmology and as a surgical antiseptic. **s. phosphates:** (1) Ag_3PO_4 = 418.7. S. orthophosphate. A yellow powder, d.7.32, m.849, insoluble in water, soluble in ammonium hydroxide; used in photography. (2) $Ag_4P_2O_7$ = 605.60. S. pyro-phosphate. A white insoluble solid, $d_{7.5°}$.5.31, m.585. (3) Ag_2PO_3 = 294.76. s. hypophosphate. **s. phosphide.** AgP_2 = 169.88. A dark-colored powder. **s. picrate.** $C_6H_2O(NO_2)_3Ag.H_2O$ = 353.9. Picratol, s. trinitrophenylate. Yellow crystals, soluble in water; used medicinally as an antiseptic. **s. plate.** Any metal utensil, vessel or ware plated or covered with metallic silver. (See *Sheffield plate,* cf. *electroplate.*) **s. plating.** The process of electrolytically depositing a film of s. on some other metal. **s. potassium cyanide.** $KAg(CN)_2$ = 199.0. Potassium argentocyanide. A colorless octahedral crystalline powder, soluble in water or alcohol; used medicinally as a strong bactericidal antiseptic, and in silvering and silver plating. **s. quinaseptol.** Argentol. **s. salicylate.** $C_6H_4(OH)COOAg$ = 244.9. White or reddish crystals, soluble in water or alcohol; used as an antiseptic. **s. salt.** Sodium anthraquinone-β-sulfonate, used as an aid in stripping dyed rags by reducing agents. **s. selenide.** Ag_2Se = 187.0. A dark gray powder; insoluble in water. **s. silicofluoride.** Ag_2SiF_6 = 357.9. Isotachiol. A colorless powder slightly soluble in water; used for sterilizing drinking water. **s. silvinate.** S. sylvate. **s. sodium chloride.** $NaAgCl_2$ = 201.8. Colorless crystals, decomp. by water. **s. sodium cyanide.** Sodium argentocyanide. **s. sodium thiosulfate.** $Na_4Ag_2(S_2O_3)_3$ = 643.6. White crystals, soluble in water; used technically. **s. solder.** An alloy of 40, 50, or 60 % Ag with Cu, Zn and Cd (British Standard Specification). **s. stearate.** $AgC_{18}H_{35}O_2$ = 391.15. A white powder, m.205, soluble in

water. s. stibide. Ag_3Sb = 443.6. S. antimonide. Rhombic black crystals, insoluble in water or dilute acids, soluble in boiling nitric acid. **s. sulfate.** Ag_2SO_4 = 311.82. Colorless triclinic or rhombic crystals, d.5.40, m.651, decomp. 925, slightly soluble in water, soluble in alcohol or nitric acid; used as a reagent and in electroplating. **s. sulfides:** (1) Ag_2S = 247.83. Native as argentite and acanthite. Gray or black regular crystals or powder, d.7.08, m.676; insoluble in water, soluble in concentrated nitric acid. Used in the manufacture of pigments for ceramics. (2) Ag_2S_2 = 279.88. A black solid. **s. sulfite.** Ag_2SO_3 = 295.8. Colorless crystals decomp. 100; slightly soluble in water or alcohol. **s. sulfocarbolate.** S. phenolsulfonate. **s. sulfocyanide.** S. thiocyanate. **s. sulfoichthyolate.** Ichthargan. **s. sulfophenylate.** S. phenolsulfonate. **s. sylvate.** $AgC_{20}H_{29}O_2$ = 408.8. S. silvinate. A brown crystalline powder; insoluble in water or alcohol. **s. tartrate.** $Ag_2C_4H_4O_6$ = 363.6. A white crystalline powder, d.3.432, slightly soluble in water. **s. telluride.** Ag_2Te = 343.1. Native as hessite. A black powder, insoluble in water. **s. thiocyanate.** AgCNS = 166.0. A white powder, insoluble in water, soluble in cyanide or ammonia solutions, decomp. by heat. **s. thiosulfate.** $Ag_2S_2O_3$ = 327.90. A white solid, soluble in water, decomp. by heat. **s. tree.** Arbor Dianae. **s. trinitrophenolate.** S. picrate. **s. vanadate.** Ag_3VO_4 and $Ag_4V_2O_7$. A solid, m.385, used as catalyst. **s. vitellin.** Argyrol.

silvering. Coating or covering with metallic silver, either produced chemically (*e.g.*, by reduction of silver salts), or deposited electrolytically.

silverweed. Wild tansy. The herb of *Potentilla anserina*, a Rosaceae, used as an astringent and tonic.

silvestrene. $C_{10}H_{16}$ = 136.1. Sylvestrene. A terpene from European turpentine. A colorless liquid, d.0.863, b.177.

silvinate. Sylvate.

sima. A liquid or semi-liquid rock substance on which the less dense sial (q.v.) floats. The word is a contraction of *silica* and *magnesium magma*.

simaruba. Bitter damson. The dried root bark of *Simaruba amara* or *S. officinalis*, a Simarubaceae of tropical America. It contains quassin and is used medicinally as an astringent.

Simarubaceae. A group of tropical shrubs and trees.

Brucea sumatrana	kosam seeds
Picrasma excelsa	Jamaica quassia
Quassia amara	Surinam quassia
Simaruba officinalis	simaruba bark
Simaruba cedron	cedron seeds
Ailanthus glandulosa	Chinese sumac
Picramnaea antidroma	cascara amarga
Castela Nicholsoni	amargosa bark

Cf. *picramnine*, *picrasmine*.

simmer. To boil gently.

Simon's test. A test for primary and secondary amines. Acetaldehyde and sodium nitroprusside added together, give a red and blue color, respectively.

simple. Not complex (as s. spectrum); not mixed (as. s. ether); not double (as, s. salt).

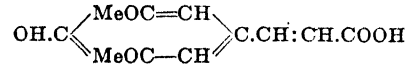
simultaneous reaction. (1) A side-reaction or secondary reaction. (2) A reaction which occurs at the same time and in the same reacting system as the principal reaction; or one of two reactions which occur at the same time and in the same reacting system. See *reaction*.

sinactine. $C_{20}H_{21}NO_4$ = 339.0. *l*-Tetrahydro-*epi*-berberine. A diisoquinoline alkaloid from *Sinomenium acutum*.

sinalbin. $C_{30}H_{44}O_{16}N_2S_2$ = 722.27. A glucoside obtained from the seeds of *Brassica* (*Sinapis*) *alba*, white mustard seed, a Cruciferae. Colorless crystalline powder, hydrolyzed to sinapine, p-oxybenzylmustard oil and glucose.

sinamine. $C_4H_6N_2$ = 82.1. Allylcyanamide. An amine derived from black mustard seed. **thio-** Allylsulfocarbimide.

sinapic acid. $C_{11}H_{12}O_5$ = 224.1. An unsaturated oxyacid derived from sinapine.



sinapine. $C_{16}H_{25}O_6N$ = 327.3. An alkaloid derived from sinalbin, the glucoside of white mustard. It is hydrolysed to sinapic acid and choline.

sinapis alba. White *mustard*. **s. nigra.** Black *mustard*.

sinapolin. $C_{21}H_{24}O_4N_3$ = 382.3. Diallylurea, $C_{14}H_{12}O_2N_2.C_7H_{12}O_2N$. A compound isolated from mustard oil.

sine. The ratio of the length of the side opposite an angle of a right-angled triangle to that of the hypotenuse gives the sine of the angle. Cf. *cosine*.

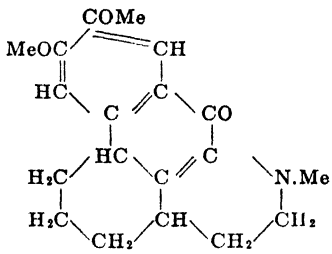
singular solution. A solution that has a maximum or minimum point on its vapor-pressure curve.

sinigrin. Potassium myronate.

sinistrin. $C_6H_{10}O_5$ = 162.1. A levorotatory carbohydrate from squill.

sinkaline. Choline.

sinomenine. $C_{19}H_{23}O_4N$ = 329.3. An isoquinoline alkaloid from the roots and stems of *Sinomenium acutum*, a Menispermaceae. Colorless needles, m.182, soluble in benzene or alkalis.



sinter. (1) The incrustations formed around mineral springs by salt deposits. (2) To vitrify by heating, as in sintering. **calcareous-** Tufa, travertine or onyx. **iron-** An amorphous form of scorodite. **pearl-** A modification of silica. **siliceous-** Geyserite. (3) Fluorite.

sintering. The coalescence of crystalline or amorphous particles into one solid mass through heating, due to the formation of allotropic crystals. Cf. *fritted*.

siomine. $(CH_2)_6N_4I_4$ = 633.6. Hexamethyleneamine tetraiodide. A colorless powder, insoluble in water or alcohol; used medicinally.

sipalin. A mixture of the cyclohexyl and methylcyclohexyl esters of adipic acid, used as plasticizers in nitrocellulose lacquers.

siphon. A ∩ shaped pipe or tube with one leg longer than the other. The short leg takes up

liquid and delivers it, by atmospheric pressure, into a receptacle on a lower level.

sipylite. A native columbate of erbium and other rare earth metals.

sirup. Syrup.

sisal. Sisal hemp. A fiber from the leaves of *Agave sisalana*, a century plant of Mexico and the West Indies; used in making rope, twine and sacking. Cf. *henequen*.

sitostane. $C_{27}H_{46}$ = 370.4. An isomer of cholane, q.v.

sitosterol. $C_{27}H_{45}OH$ = 386.4. An alcohol from wheat, corn, bran and calabar beans; an isomer of cholesterol. Cf. *cholane*. β- $C_{29}H_{48}O$ = 412.4. *22*-Dihydrostigmasterol. **dihydro-** $C_{27}H_{48}O.H_2O$ = 406.37. An alcohol, m.140–141, from corn, wheat, etc. A colorless mass, m.140; insoluble in water.

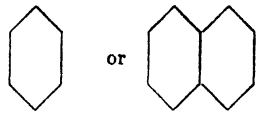
six hundred six. (606). Salvarsan.

sizing. The dressing and preparation of textiles for printing. **tub-** See *tub*. **s. materials.** In textile and paper industries: starch, dextrin, gums, gelatin, rosin, tragacanth, albumin, casein, or other substances used to prevent water or ink absorption due to capillary attraction.

skatole. C_9H_9N = 131.1. Methylindole. Colorless leaflets with a strong fecal odor, m.95, b.265, insoluble in water, soluble in alcohol; formed as a decomposition-product of proteins.

skatoxyl. The monovalent radical, C_9H_8ON, derived from skatole.

skeleton symbol. An abbreviated structural formula, in which the ring compounds are usually represented as:



(see *structure symbols, ring systems*).

skelgas. Pentane.

skiagenol. A vegetable oil containing 20 % iodine; used as a radiopaque oil in radiography.

skiagram. Radiograph.

skiagraph. (1) A photograph made by x-rays. (2) Scotograph.

skiameter. A device for measuring the intensity of x-rays preparatory to a photographic exposure.

skimmianine. $C_{32}H_{29}O_9N_3$ = 599.3. An alkaloid from the Japanese plant, *Skimmia japonica*, a Rutaceae.

skimming. Removing the dross from molten metal, or the foam and floating substances from liquids in general.

skin varnish. A preparation for covering skin wounds; as, collodion.

skiver. A sheepskin, split, and tanned with sumach. Cf. *roan*.

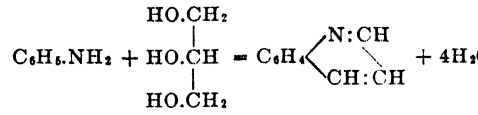
sklero- See *sclero*.

skleron. An aluminum alloy which contains lithium, copper, zinc, and manganese.

sklodowskite. A radioactive mineral, MgO, $2UO_3.2SiO_2.7H_2O$, from the Belgian Congo. Named in honor of Mme. Curie (née Sklodowska).

skotography. Scotography.

Skraup, Zdenko Hans. 1850–1910. A Polish chemist, noted for organic synthesis. **S. synthesis.** Quinoline synthesis. A ring-formation obtained by heating an aromatic amine with a free ortho-position (as aniline) with glylerin and concentrated sulfuric acid in the presence of an aromatic nitro-body (as nitrobenzene); yield, 75 %:



skullcap. Scutellaria.

skunk. The mammal *Mephitis mephitis;* it has an offensively odorous secretion. **s. bush.** Feverbush. The leaves of *Garrya Fremontii*, a Cornaceae of California, used as a tonic; it contains garryine. **s. cabbage.** The dried rhizomes of *Symplocarpus foetidus*, an Araceae; used medicinally, as the fluid extract, as a stimulant and antispasmodic.

skutterudite. $CoAs_3$. A native cobalt arsenide.

slack. (1) Slake. To quench with water. (2) Lumpy and damp, as soft coal or lime when exposed to air and water. (3) Loose. (4) Slow.

slacken. The mixing of ores with slag to prevent fusion of the non-metallic portions.

slag. The vitreous mass which separates from fused metals during the melting of ores. **basic s.** Thomas s. A slag composed of calcium phosphate and free lime, produced in the manufacture of steel by the basic hearth process, and a valuable fertilizer. **Thomas s.** Basic s. **s. wool.** A fibrous packing material made by pouring molten slag into a pan with steam injection.

slake. To slack or loosen.

slaked lime. Calcium hydroxide.

slat. A thin, flat piece of slate, stone or glass.

slate. A dense, fine-textured rock whose separate mineral constituents are indistinguishable to the unaided eye. It has parallel cleavage planes and breaks into thin plates. Cf. *shale*. **polishing-** A gray or yellow shale, used for polishing.

slide. A plane glass plate; as, **lantern-** of size 80 × 100 mm. (3¼ × 4″) for projection, and **microscope-** of size 25 × 75 mm. (1 × 3″) for observation.

slide rule. A ruler with a medial slide, both scales of which are graduated logarithmically and numbered. As the addition of two logarithms equals the product of their two antilogarithms, so in the slide rule the addition of two lengths gives the desired result of multiplication; while the subtraction of one length from the other is equivalent to division. **chemical-** A slide rule that is labelled with common chemical factors. It is used for the rapid calculation of analytical results.

slime. A fine powder held in suspension; as, the ore mud of ore crushers. **s. molds.** Myxomycetes.

slip. (1) A fluid suspension of clay, fluxing material and water, used to coat ceramics before final heating; *e.g.*, ZnO and clay, which gives a glaze.

sludge. A soft mud; as, the refuse from a coal washing plant or the sediments obtained in the purification of city sewage. **activated-** S. produced by bubbling air through sewage, thus promoting growth of aerobic bacteria. Filtered and dried this forms a useful fertiliser. N 4 to 6 %; P_2O_5 2.5 to 4 %. **Imhoff-** S. produced by the action of anaerobic bacteria; it is

a low-grade fertilizer: N 1.5 to 2.5 %; P_2O_5 1 %. **s. acid.** The tarry substance from the bottom of oil refining-tanks; it consists of the impurities from the oil mixed with the strong sulfuric acid used as refining agent. **s. acid phosphate.** A superphosphate manufactured with petroleum sludge acid. It has a characteristic odor.

slug. The mass which acquires an acceleration of 1 foot/sec.^{2} under the free weight of 1 pound. **metric-** That mass which acquires an acceleration of 1 meter/sec.^{2} under a free weight of 1 kilogram.

sluice. A long, inclined flume or trough for washing gold-bearing earth and gravel in a stream of water. **s. box.** A wooden box or trough in which the heavier gold accumulates during the washing of auriferous gravel.

sluicing. The washing of auriferous earth by a stream of water rushing through long boxes provided with riffles, or other gold-retaining devices.

slum. The insoluble oxidation-products deposited from lubricating oil. They are eliminated by extraction of the oil with suitable solvents.

Sm. The symbol for samarium (see also *Sa*).

smalt. A blue glass or pigment of cobalt, potash and silica.

smaltine. Smaltite.

smaltite. $CoAs_2$. Cobalt pyrites. Smaltine. A native cobalt diarsenide. Cf. *bismuthosmaltite, speiss cobalt.*

smaragd. A green variety of beryl, used as a gem.

smart weed. Waterpepper.

smectic. Pertaining to liquid crystals of the soap-like type, having disc-shaped molecules. Cf. *nematic.*

smell. See *odors.*

smelt. (1) To obtain metals from their ores by a process which includes fusion. In general it includes (a) calcination and roasting to remove sulfur and other volatile constituents; (b) reduction or smelting proper in which the metals are fused and separated from gangue; (c) refining, during which the metals are purified. (2) The material obtained in stage (b).

smelter, smeltery. An establishment or plant where ores are converted into metals.

smilacin. (1) $C_{18}H_{30}O_6 = 342.3$. Salseparin, pariglin. A glucoside from sarsaparilla. (2) $C_{28}H_{42}O_3 = 402.3$. A solid, decomp. 160.

Smilax. A genus of climbing plants which includes sarsaparilla and chinaroot (Liliaceae).

Smith, Edgar Fahs. 1854–1929. An American chemist, noted for his writings and educational methods.

smithite. $AgAsS_2$. A silver sulfide.

Smithson, James. 1765–1829. An English chemist and mineralogist, noted for his bequest which led to the foundation of the Smithsonian Institution.

Smithsonian Institution. A government establishment in Washington, D. C., created by Act of Congress in 1846 according to the terms of the will of James Smithson "to increase and diffuse knowledge among men." It consists of the
Smithsonian Library
Bureau of the International Catalogue
United States National Museum
National Gallery of Art
Bureau of American Ethnology
National Zoological Park
Astrophysical Observatory

smithsonite. $ZnCO_3$. Calamine. A native white or yellow carbonate of zinc.

smoke. The material escaping or expelled from a burning substance. It usually consists of a dispersed system of solid carbon in air. **s. stone.** Smoky quartz. **s. screen.** A smoke or fog produced by chemical reactions, which serves to screen vessels or objects from observation. During World War I vapors of silicon tetrachloride and ammonia, also oleum or concentrated sulfuric acid injected into smoke stacks, were used.

smokeless powder. An explosive which consists mainly of nitrocellulose.

smokes. A colloidal system which consists of a solid phase suspended in a gaseous phase. It is also termed, sogasoid, from so(lid) gas(eous).

smoky quartz. A smoky, gray or brown colored variety of quartz. **s. topaz.** Smoky quartz used for jewelry.

Sn. The symbol for tin (stannum).

snake. One of a large class of reptiles. **s. head.** Balmony, turtle bloom. The leaves of *Chelone glabra*, a Scrophulariaceae, used as anthelmintic, tonic and detergent. Cf. *chelonin.* **s. lily.** Iris. **s. poison.** S. venom. **s. root.** Snakeroot. **s. venom.** The proteins secreted by certain s., which cause hemolysis of the blood. **s. weed.** Bistort.

snakeroot. black- Cimifuga. **Canada-** Asarum. **Seneca-** Senega. **Texas-, Virginia-** Serpentaria.

snow. A crystalline, finely-divided form of water. **carbon dioxide-** Frozen carbon dioxide obtained by rapid evaporation of liquid carbon dioxide. It has a temperature of −110°C., and is sometimes mixed with ether; used (as "dry ice") in refrigeration. **nitrous oxide-** The snow formed by the rapid evaporation of liquid nitrous oxide.

soap. A salt of one or more of the higher fatty acids with an alkali or metal. Soaps may exist in two micro-crystalline forms, viz. hexagonal plates and curd fibres, and in three types of solution, viz. isotropic solutions (including lyes and nigre), and neat and middle soaps, the two latter being conic, anisotropic "liquid crystal" forms. **Castile-** A soap made from sodium carbonate and olive oil. **essence of-** An alcoholic soap solution, used in pharmacy. **hard-** An ordinary soap, made with soda. They give a poor lather. **marine-** Salt water-. **metallic-** The salts of heavy metals with oleic, stearic, palmitic, erucic, and lauric acids. Used in the paint, varnish and textile industries as siccatives and dryers (Pb, Co, Mn); for waterproofing leather; decolorizing varnish (Zn, Fe, Ni, Co, Cr); waterproofing explosives and textiles (Al, Mg); and as fungicides and sprays (Cu, Hg). **middle-** A phase sometimes formed in soap boiling at concentrations intermediate between those of neat soap and isotropic solutions. A conic, anisotropic solution, plastic but inelastic, and darker in color (due to impurities) than neat soap. **neat-** The upper layer in the soap pan or kettle. It is an anisotropic (liquid crystal) solution containing about 63 % fatty acid for sodium, and 40 % fatty acid for potassium, soaps. **potash-** A soft soap made with potassium hydroxide. **salt water-** S. containing caproic, caprylic, capric and myristic acids, which are not readily precipitated by Ca^{++} and Mg^{++} ions; made from coconut oil. **soda-** A hard soap made with sodium hydroxide. **soft-** Soap made with potash. They give a good lather. **toilet-** An ordinary soap containing 70 % or more of fatty and resin acids.

transparent- S. made transparent by adding methyl alcohol. **white curd-** S. made from tallow.

s. bark. Quillaia. **s. root.** Saponaria. **s. tree.** Quillaia. **s. wort.** Saponaria.

soapstone. Talc.

Sobrero, Ascanio. 1812–1888. An Italian chemist and discoverer of nitroglycerin (1847). Cf. *Nobel.*

to magnesium with emission of β^-rays (electrons). It can also be produced by neutron bombardment of Na, Mg and Al:

$$_{11}Na^{23} + {}_0n^1 \rightarrow {}_{11}Na^{24}$$
$$_{12}Mg^{24} + {}_0n^1 \rightarrow {}_{11}Na^{24} + {}_1H^1$$
$$_{13}Al^{27} + {}_0n^1 \rightarrow {}_{11}Na^{24} + {}_2He^4$$

Used as a synthetic radioactive element in medical research.

PHYSICAL PROPERTIES OF SODIUM

m.97.6°C; b.880°C.

$d_0°$.0.9721; $d._{97.6(s)}$0.9519; $d._{97.6(l)}$0.9219; $d._{880°(l)}$0.7414.

Surface tension: 293.6 dyne/cm. (against CO_2 at 97.6°C).

Electric conductivity: at 0°C. 19.84 × 10^4 mho; at 75°C. 17.1 × 10^4 mho.

Thermal conductivity: 0.305 cal./cm./cm.²/sec. at −100°C; 0.335 at 0°C; 0.270 at 75°C.

Specific heat: (solid) 0.2930 at 0°C., 0.3266 at 97.6°C.; (liquid) 0.334 at 97.6°C., 0.3369 at 100°C.

Heat of vaporization: 1100 cal./gm. at 880°C.

Heat of fusion: 27.21 cal./gm. at 97.6°C.

Critical temperature: 2000°C. Critical pressure: 343 atm.

sobrerol. Pinol hydrate.

sobrerone. Pinol.

soda. Sodium carbonate. **baking-** Sodium bicarbonate. **caustic-** Sodium hydroxide (solution). **chlorinated-** Sodium hypochlorite. Sal-sodium carbonate. **sesqui-** A molecular mixture of $NaHCO_3$ and Na_2CO_3. **washing-** Sodium carbonate.

s. alum. A double salt of aluminum and sodium sulfates. **s. ash.** A commercial anhydrous sodium carbonate (99 % Na_2CO_3). Used in the manufacture of glass, soap, paper, chemicals, paints, drugs, leather, enamel ware, cleansers, in metallurgy, dyeing, refining oils, the textile industry, and many other chemical processes. **s. feldspar.** Albite. **s. lime.** See *sodium hydroxide with lime.* **s. nitre.** Native sodium nitrate. **s. process.** (1) A method of manufacturing sodium carbonate. (See *Le Blanc, Solvay processes.*) (2) See *soda pulp.* **s. pulp.** Wood fibers obtained by digesting chipped wood with sodium hydroxide under 100 pounds per sq. in. pressure; used in the manufacture of paper. **s. water.** A beverage made by injecting CO_2 into a solution of Na_2CO_3; cf. aerated or mineral *waters.*

sodalite. $Na_4Al_3Si_3O_{12}Cl$. A silicate of aluminum and sodium, which contains salt.

sodamide. Sodium amide.

Soddy, Frederick. 1877– . An English chemist, noted for his researches on radioactive elements and Nobel Prize (1921) in chemistry.

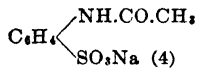
sodic. Containing sodium. (An obsolete term.)

sodio-malonic. Sodium malonic.

sodion. Same as sodium ion. Na^+.

sodium. Na = 22.997. Natrium. An alkali metal element, atomic number 11. A tetragonal crystalline, soft metal, silvery-white when freshly cut but rapidly becoming dull on exposure to air. It is stored under coal oil. It becomes brittle at low temperature, $d_{15°}$.-0.9732, m.97, b.880, decomp. water; insoluble in alcohol, benzene, or ether. Marggraf differentiated soda and potash in 1757, and Davy isolated the metal in 1807. Used as a reagent, a reducing agent, a dehydrating agent, a flux, and in organic synthesis, for the manufacture of NaCN, Na_2O, Na_2O_2, indigo, antipyrine, acetoacetic ester, tetraethyl lead, sodium azide. **radio-** The isotope of mass 24, having a half-life of 15.5 hours, and formed from Na by bombardment with deuterons: $_{11}Na^{23} + {}_1D^2 \rightarrow {}_{11}Na^{24} + {}_1H^1$. It decomposes

s. abietinate. S. sylvate. **s. acetate.** $NaC_2H_3O_2$ = 82.0. CH_3COONa. Colorless monoclinic crystals, d.1.4, m.58, soluble in water, alcohol or ether. Used as a mordant, in the manufacture of acetic acid, acetic ether, pigments, in photography, for filling thermophores; as a reagent for alkaloids, and in quantitative analysis. *hydrated-* $NaC_2H_3O_2.3H_2O$ = 136.07. Monoclinic, colorless crystals d.1.45, m.58. Soluble in water. **s. acetotungstate.** $Na_2(CH_3CO)WO_4$ = 337.0. S. acetwolframate. A white crystalline powder, soluble in water; used as a microscope reagent. **s. acetsulfanilate.** $NaC_8H_8O_4S$ = 223.0. Cosaprin,



A greenish-white, fine crystalline powder, soluble in water and slightly soluble in alcohol. Used medicinally. **s. acetwolframate.** S. acetotungstate. **s. acetylarsanilate.** $NaAsO_2.C_6H_4.NHCOCH_3$ = 264.1. A yellowish crystalline powder, soluble in water; used medicinally. **s. acetyl salicylate.** $C_2H_3O.OC_6H_4COONa$ = 202.06. Hydropirin, pyranol; used medicinally. **s. agaricinate.** A colorless powder, soluble in water; used medicinally. **s. alginate.** The sodium salt of alginic acid; used as antisettling agent for chocolate-milk drinks, as a gelatin substitute in ice cream, and as protective colloid in pharmaceuticals and cosmetics. **s. alizarinsulfonate.** $NaC_{14}H_5O_2(OH)_2SO_3$ = 342.1. Alizarin carmine. An orange-yellow powder, soluble in water or alcohol. Used as a dye, and indicator for strong acids (yellow) and strong alkalis (violet) (except carbonates). **s. alloys.** A mixture of sodium with some other metal (for m., see table).

with	90 % Na 10 %	80 % Na 20 %	70 % Na 30 %	60 % Na 40 %	50 % Na 50 %
Bi	425	520	590	645	690
Cd	125	185	245	285	325
Hg	90	80	70	60	45
K	77	58	41	26	11
Pb	130	200	250	290	330

s. alum. Aluminum s. sulfate. **s. aluminate.** $Na_2Al_2O_4$ = 164.2. A colorless amorphous powder, m.1850, soluble in water, or alcohol, insoluble in alkalis or ether. **s. aluminum chloride.** $2NaCl,AlCl_3$ = 383.7. A colorless deliquescent solid, m.185. **s. amalgam.** A mercury amalgam with 2 % to 10 % of sodium. Gray pieces, the size of a pea, used as a reducing agent and in organic synthesis. **s. amide.** $NaNH_2$ = 39.03. Sodamide. Colorless crystals, m.208, sublimes 400; decomp. by water. Used in organic synthesis similarly to sodium, but should not be kept longer than 12 hours as it forms explosive products when exposed to air. **s. aminosuccinate.** S. asparaginate. **s. ammonium acid phosphate.** Sodium ammonium phosphate. **s. ammonium phosphate.** $NaNH_4HPO_4.4H_2O$ = 209.15. Microcosmic salt, triphosphate, acid sodium ammonium phosphate. Colorless crystals, soluble in water. Used as a reagent in blowpipe analysis, for standardizing uranium solutions, and in the determination of magnesium and manganese. Decomposed by heat, and forms a molten bead which is colored characteristically by impurities. **s. ammonium sulfate.** $NaNH_4SO_4$ = 137.1. Colorless crystals; soluble in water. **s. amylsulfate.** $C_5H_{11}SO_4Na$ = 202.2. A colorless crystalline powder; soluble in water. **s. amylxanthogenate.** $NaC_6H_{11}OS_2$ = 186.1. $Me_2CH.CH_2.CH_2.O.CS_2Na$. Yellowish crystals, soluble in water; used as a bactericide and insecticide. **s. amytal.** Isoamyl ethyl barbiturate. A white powder, soluble in water; used as a basal hypnotic for intravenous injection. **s. anhydromethylenecitrate.** Citarin. **s. aniline sulfonate.** S. sulfanilate. **s. anisate.** $NaC_8H_7O_3$ = 174.1. $C_6H_4(OMe)COONa$. White crystals, soluble in water. Used medicinally as an antipyretic and antirheumatic. **s. anthranilate.** $NaC_7H_6O_2N$ = 159.1. Sodium orthoaminobenzoate, $NH_2.C_6H_4.COONa$. A grayish powder, soluble in water or alcohol; used as an antiseptic. **s. anthrarobinate.** A sodium salt of anthrarobin. A dark-brown powder, soluble in water or alcohol; used medicinally for skin diseases. **s. antimonate.** $2NaSbO_3,7H_2O$ = 508.5. Colorless octahedral crystals; slightly soluble in water or alcohol. *pyro-* See *sodium pyroantimonate.* **s. antimony tartrate.** Plimmer's salt, $Na(SbO)C_4H_4O_6$. Colorless, transparent crystals, soluble in water. **s. argentocyanide.** $NaAg(CN)_2$ = 182.90. S. silver cyanide. A yellow, soluble solid produced in the cyanide process for the extraction of silver. **s. arsanilate.** $Na(AsO_2)C_6H_4NH_2$ = 222.2. Colorless crystals; soluble in water or alcohol **s. arsenates:** *normal-* $Na_3AsO_4.12H_2O$ = 424.2. Colorless crystals, d.1.754, m.85, soluble in water or alcohol; used as a reagent. *s. arsenate, acid-* (1) $Na_2HAsO_4.12H_2O$ = 402.2 (Dodecahydrate). Colorless monoclinic or rhombic crystals, d.1.71, m.28, b.100; soluble in water or alcohol. (2) $Na_2HAsO_4.7H_2O$ = 312.1 (Heptahydrate). Colorless monoclinic prisms, m.57, b.100; soluble in water or alcohol; used as a reagent, and medicinally as a tonic and antiseptic. (3) Na_2HAsO_4 = 186.0 (Anhydrous). A white amorphous powder, soluble in water or alcohol; used in dyeing and printing textiles. **s. arsenide.** Na_3As = 143.96. A dark solid, which evolves arsine in presence of water. **s. arsenite.** $NaAsO_2$ = 129.9 (meta-) or Na_2HAsO_3 = 170.0 (ortho-). A grayish-white powder, d.1.87, soluble in water or alcohol; used in the manufacture of antiseptic soap, in the leather industry and as a parasiticide. **s. asparaginate.** $NaC_4H_6O_4N$ = 155.1. Sodium aminosuccinate, $HOOC.CH_2.CHNH_2.COONa$. Colorless rhombic needles; soluble in water. **s. arsphenamine.** The sodium salt of salvarsan. **s. auribromide.** Gold sodium bromide. **s. aurichloride.** Gold sodium chloride. **s. aurosulfide.** $NaAuS.4H_2O$ = 324.33. Colorless crystals. **s. azide.** NaN_3 = 65.1. An explosive solid, used in detonators. **s. azo-a-naphthol-sulfanilate.** Tropeolin. **s. barbitone.** Barbital sodium. **s. benzene sulfonate.** $NaC_6H_5SO_3$ = 180.1. Sodium sulfobenzene, $Ph.SO_3Na$. A colorless crystalline powder; soluble in water or alcohol. **s. benzoate.** $NaC_7H_5O_2$ = 144.0. A white amorphous powder or colorless crystals, soluble in water or alcohol; used medicinally as an antiseptic and antipyretic. **s. benzosulfinide.** $NaC_7H_4O_3NS.2H_2O$ = 241.2. Soluble gluside, soluble saccharin. The sodium salt of saccharin, sodium benzoylsulfonate, $C_6H_4CO.SO_2.N.NA$. Colorless crystals, soluble in water; used medicinally as an intestinal antiseptic. **s. benzosulfite.** A colorless crystalline powder, used as an antiseptic. **s. benzoylsulfonate.** S. benzosulfinide. **s. biborate.** S. borate. **s. bicarbonate.** $NaHCO_3$ = 84.01. Acid sodium carbonate, baking soda. A white opaque powder or colorless crystals, d.2.206, decomp. 270, soluble in water, insoluble in alcohol. Used as a reagent; in making volumetric solutions; medicinally as an antiacid; pharmaceutically in effervescent mixtures; and in baking powders. **s. bichromate.** S. dichromate. **s. bifluoride.** $NaHF_2$ = 62.0. An acid salt, NaF.HF. Colorless, crystalline powder, soluble in water. Used as a powerful antiseptic, in ant powders, preservatives, and for etching glass. **s. bilactate.** $NaH(C_3H_5O_3)_2$ = 202.1. A colorless liquid; soluble in water. **s. binoxalate.** $NaHC_2O_4$ = 112.0. Acid sodium oxalate. Colorless monoclinic crystals, soluble in water; used in stain and ink removers. **s. biphosphate.** See *s. phosphates.* **s. bipyrophosphate.** See *s. pyrophosphate.* **s. bismuthate.** $NaBiO_3$ = 280.0. A light, fawn colored powder, used in Mn determinations. **s. bismuth thiosulfate.** $Na_3Bi(S_2O_3)_3$ = 614.42. A colorless crystalline solid. **s. bisulfate.** $NaHSO_4.H_2O$ = 138.1. Acid sodium sulfate. Large colorless crystals, d.1.8, m.300, soluble in water. Used as a reagent, as a flux for decomposing minerals, in thermophores, and as an antiseptic for drinking water. **s. bisulfite.** $NaHSO_3$ = 104.07. A white crystalline powder, soluble in water, insoluble in alcohol. Used as a reagent and reducing agent in qualititive and quantitative analysis; as a disinfectant and bleach; as a preservative; as an antiseptic in the fermentation industry; also medicinally. **s. bitartrate.** $NaHC_4H_4O_6.H_2O$ = 190.08. Colorless crystals or powder, soluble in water. Used as a reagent and in effervescent mixtures. **s. borates:** (1a) *S. metaborate.* $NaBO_2$ = 66.0. Colorless hexagonal prisms, m.966; soluble in water, alcohol or ether. (1b) *S. metaborate, tetrahydrate.* $NaBO_2.4H_2O$ = 203.6. Neutral sodium borate. Colorless monoclinic prisms, m.57, soluble in water, alcohol or ether; used as an antiseptic. (2a) *S. tetraborate, calcined.* $Na_2B_4O_7$ = 202.0. A white

spongy mass or powder, soluble in water; used as a reagent. (2b) *S. tetraborate, fused.* $Na_2B_4O_7$ = 202.0. Borax glass, anhydrous borax. A colorless vitreous mass, d.2.367, m.741; slightly soluble in water, soluble in alcohol, insoluble in ether; used as a reagent. (2c) *S. tetraborate, pentahydrate.* $Na_2B_4O_7.5H_2O$ = 292.1. Colorless octahedral crystals, d.1.815, slightly soluble in water or alcohol, insoluble in ether; used as a reagent. (2d) *S. tetraborate, decahydrate.* $Na_2B_4O_7.10H_2O$ = 382.2. Borax, sodii boras, (U.S.P.), sodium biborate, s. pyroborate. Colorless monoclinic crystals or white powder, $d._{17}°1.72$, m. at red heat; slightly soluble in water, insoluble in alcohol. Used as a reagent and flux, in blowpipe analysis, for borax beads, in metallurgy, as a preservative, and as an antiseptic. **s. borosalicylate.** Borsalyl, a reaction product of salicylic acid and sodium borate. A white powder, soluble in water; used medicinally as an antiseptic. **s. bromate.** $NaBrO_3$ = 150.9. Colorless, lustrous crystals, d.3.339, m.384, soluble in water or alcohol, insoluble in ether; used as a reagent and oxidizing agent, in volumetric analysis and in the determination of phenols. **s. bromides.** (1) NaBr = 102.9. Colorless cubic crystals, d.3.014, m.768; soluble in water, ether or alcohol. Used as a reagent, and medicinally as an alternative and diuretic. (2) $NaBr.2H_2O$ = 138.95. Colorless monoclinic crystals, d.2.176; soluble in water, alcohol or ether. **s. butylsulfate.** $NaSO_4C_4H_9$ = 176.1. Colorless crystals; soluble in water. **s. butyrate.** $NaC_4H_7O_2$ = 110.06 or C_3H_7COONa. Colorless deliquescent crystals, soluble in water; used in organic synthesis. **s. cacodylate.** $NaAsO_2(CH_3)_2$ = 160.02 and $NaAsO_2Me_2.3H_2O$ = 214.17. A white amorphous powder, soluble in water. Used medicinally, especially in ampoule medication as a hematinic. **s. caffeine sulfonate.** Symphorol N. **s. camphorate.** $Na_2C_{10}H_{14}O_4$ = 244.2. A white deliquescent powder, soluble in water; used medicinally as an antiseptic. **s. cantharidate.** $Na_2C_{10}H_{14}O_6.2H_2O$ = 312.2. The sodium salt of cantharides camphor, the active principle of *Cantharis vesicatoria.* A white crystalline powder, soluble in water; used medicinally as a tonic. **s. carbide.** Na_2C = 58.0. A gray powder; decomp. by water. **s. carbolate.** S. phenate. **s. carbonate.** Soda, washing soda. Cf. *Solvay process, ammonia soda process.* There are several hydrated forms: (1) *Anhydrous.* Na_2CO_3 = 106.0. A white powder, d.2.476, m.852, decomp. by further heat, soluble in water. Used as a reagent and in freezing mixtures. Cf. *sesquisoda, soda ash.* (2) *Monohydrate.* $Na_2CO_3.H_2O$ = 124.0. A white, crystalline powder, soluble in water, insoluble in ether; used as a reagent and in photography. (3) *Decahydrate.* $Na_2CO_3.10H_2O$ = 286.2. Colorless monoclinic crystals, d.1.458, m.34, b.106, soluble in water, insoluble in alcohol or ether. Used as a reagent, precipitant and neutralizer, for volumetric solutions, medicinally as an antiacid, and in large amounts as soda ash (q.v.). (4) *Peroxide form.* $Na_2CO_3.1\frac{1}{2}H_2O_2$ = 157.01. This was formerly regarded as a peroxide. **s. carminate.** $Na_2C_{11}H_{10}O_6$ = 284.1. A red powder, soluble in water; used as a dye in microscopy. **s. chlorate.** $NaClO_3$ = 106.5. Colorless cubic or tetragonal crystals, d.2.490, m.250, decomp. by further heat; soluble in water, slightly soluble in alcohol or ether. Used as a reagent, in explosives and pyrotechnics, medicinally as antiseptic, in toothpastes, and gargles. **s. chloride.** NaCl = 58.5. Table salt, common salt, rock salt, sea salt. Colorless cubic crystals or crystalline powder, d.2.176, m.800; soluble in water, insoluble in alcohol or ether. Used as a reagent, as a condiment, for freezing mixtures and reducing chlorine; and in industry and technology for many purposes. **s. chlorite.** $NaClO_2$ = 90.5. A colorless crystalline powder, soluble in water; used as an oxidizing agent. **s. *p*-chlorobenzoate.** Mikrobin. **s. chloroplatinate.** S. platini chloride. **s. chloroplatinite.** S. platino chloride. **s. chlorosulfonate.** $NaClSO_3$ = 138.7. A fine crystalline powder, readily hydrolysed to HCl; used as a reagent in sulfonation and chlorination. **s. cholate.** A former name for bile salts, q.v. **s. chromate.** $Na_2CrO_4.10H_2O$ = 342.2. Yellow triclinic crystals, d.2.71, m.20, soluble in water, slightly soluble in alcohol or ether; used as a reagent and mordant, and in organic synthesis. **s. chromite.** Na_2CrO_3 = 146.1. Bright green needles; soluble in water. **s. cinnamate.** $NaC_9H_7O_2$ = 170.1. Hetol. A white crystalline powder, soluble in water; used medicinally. **s. citrate.** $2Na_3C_6H_5O_7.11H_2O$ = 714.3. Sodii citras (U.S.P.). Colorless crystals, m.150, soluble in water slightly soluble in alcohol or ether. Used as a reagent, and medicinally as an antipyretic and refrigerant. **s. coerulinsulfate.** Indigo carmine. **s. cyanaurite.** Aurous s. cyanide. **s. cobaltic nitrite, s. cobaltinitrite.** $Na_3Co(NO_2)_6.\frac{1}{2}H_2O$ = 413.0. A dark purple hygroscopic, crystalline powder, soluble in water. **s. cobaltic nitrite solution.** A clear, brown solution of 4 gm. cobaltous chloride, 10 gm. sodium nitrite, and 2 cc. acetic acid (36 %) in 100 cc. water; used as a reagent for potassium. **s. cobaltinitrite.** S. cobaltic nitrite. **s. copaivate.** $C_{20}H_{29}O_2Na$ = 324.24. A yellowish powder, soluble in water; used as an antiseptic. **s. corallinate.** Sodium rosolate. **s. cyanamide.** Na_2NCN = 86.02. **s. cyanide.** NaCN = 49.01. A white, deliquescent, crystalline powder, soluble in water, slightly soluble in alcohol or ether. Used in electroplating, case-hardening, flotation and extraction of metals (cyanide process), fumigation, synthesis of fine chemicals and rubber accelerators; as a reagent; parasiticide and antiseptic. **s. dichromate.** $Na_2Cr_2O_7.2H_2O$ = 298.0. S. bichromate. Red, triclinic crystals, d.2.52, m.320, decomp. 400, soluble in water, insoluble in alcohol. Used as a reagent, as an oxidizing substance, and medicinally as an antiseptic. **s. diethylbarbiturate.** $NaC_8H_{11}O_3N_2$ = 206.1. Barbital-sodium, the monosodium salt of barbital. White crystals, soluble in water, insoluble in alcohol or ether; used medicinally as a hypnotic. **s. diethyl dithiocarbamate.** $Et_2N.CS.SNa$ = 171.2. A white solid; a sensitive reagent for copper. **s. dihydrogen phosphate.** See *S. phosphates, monobasic.* **s. dimethylaminoazobenzenesulfonate.** Methyl orange. **s. dinitrocresolate.** Antinonnin. **s. dioxide.** S. peroxide. **s. disulfate.** S. pyrosulfate. **s. dithionate.** S. hyposulfate. **s. dithiosalicylate.** Dithion. **s. divanadate.** $Na_2V_4O_{11}.9H_2O$ = 589.0. S. tetravanadate. Orange red crystals, slightly soluble in water; used in the manufacture of dyes and inks. **s.**

ethoxide. S. ethylate. **s. ethylate.** NaC_2H_5O = 68.0. EtONa. S. ethoxide. A white hygroscopic powder, soluble in water or alcohol; used as a reagent, and medicinally as an escharotic. **s. ethylsulfate.** $NaC_2H_5SO_4$ = 148.11. S. sulfovinate. A colorless deliquescent, crystalline powder, soluble in water or alcohol. **s. ferricyanide.** $Na_3Fe(CN)_6.H_2O$ = 298.93. Red prussiate of soda. Ruby-red, hygroscopic crystals, soluble in water, insoluble in alcohol or ether. Used as a reagent, and in the manufacture of pigments and blue-print paper. **s. ferric oxalate.** $2Na_3Fe(C_2O_4)_3.10H_2O$ = 957.82. Monoclinic green crystals, d.1.973, dehydrated at 100° ($4H_2O$) and 200°C ($10H_2O$); soluble in water. **s. ferrite.** $Na_2Fe_2O_4$ = 221.7. An unstable salt of sodium; decomposed by water. **s. ferrocyanide.** $Na_4Fe(CN)_6.12H_2O$ = 520.18. Yellow prussiate of soda. Yellow monoclinic prisms, d.1.458, soluble in water, insoluble in alcohol or ether. Used as a reagent in photography, and in the manufacture of pigments. **s. fluobenzoate.** $C_6H_4FCOONa$ = 162.0. A white crystalline powder, soluble in water; used medicinally as an antiseptic. **s. fluorescein.** Uranin. **s. fluoride.** NaF = 42.0. Colorless cubic crystals, d.2.766, m.982, soluble in water, slightly soluble in alcohol or ether. Used as a reagent for blood; as an antiferment in the brewing industry, yeast manufacture, and distilleries; medicinally, as an antiseptic. **s. fluosilicate.** Na_2SiF_6 = 188.05. S. silicofluoride, salufer. A white crystalline powder, d.2.755, slightly soluble in water, insoluble in alcohol or ether. It is a by-product of superphosphate manufacture; used as reagent, antiseptic and insecticide, also in enameling and laundering. **s. formaldehyde sulfoxylate.** $NaHSO_2.HCHO.2H_2O$. A reducing agent used in the dyeing industry. **s. formate.** $NaCHO_2$ = 68.0 or HCOONa. Colorless rhombic crystals, d.1.919, decomp. by heat, soluble in water, alcohol or glycerol. Used as reagent for arsenic and phosphorus, and as an antiseptic. **s. furacrylate.** $C_4H_3OCH:CHCOONa$ = 160.03. A light brown powder, d.1.919, soluble in water. **s. germanate.** Na_2GeO_3 = 166.0. Colorless crystals, soluble in water; used as a hematinic. **s. glycerinophosphate, s. glycerophosphate.** $Na_2C_3H_7PO_6.xH_2O$. A yellowish viscid liquid, soluble in water. Used extensively in ampoule medication as a tonic and hematinic; also as reagent for phosphatase. **s. gynocardate.** $NaC_{14}H_{23}O_2$ = 246.0. A yellow powder, soluble in water or alcohol; used medicinally as an antiseptic. **s. halides.** The sodium salts of the halogen acids; as NaF, NaCl, NaBr and NaI. **s. hippurate.** $NaC_9H_8O_3N$ = 201.07. A white powder, soluble in hot water; used medicinally. **s. hydrate.** S. hydroxide. **s. hydride.** NaH = 24.01. Colorless crystals, d.0.92; decomp. by water or heat. **s. hydrogen arsenate.** $Na_2HAsO_4.12H_2O$ = 402.21. A solid, d.1.6, fairly soluble in water. **s. hydrogen arsenite.** Na_2HAsO_3 = 169.97. A colorless solid, d.1.87, soluble in water. **s. hydrogen carbonate.** S. bicarbonate. **s. hydrogen oxide.** S. hydroxide. **s. hydrogen peroxide.** (1) Sodyl hydroxide. (2) $2NaOH.H_2O_2$ = 148.04. A white solid. **s. hydrogen phosphate.** See *s. phosphates*. **s. hydrogen phosphite.** See *s. phosphites*. **s. hydrogen sulfate.** S. bisulfate. **s. hydrogen sulfide.** S. hydrosulfide. **s. hydropyroantimonate.** S. metantimonate. **s. hydrosulfate.** S. sulfhydrate. **s. hydrosulfide.** $NaHS.2H_2O$ = 92.10. S. hydrogen sulfide. Deliquescent, colorless crystals, decomp. by heat, soluble in water or alcohol. **s. hydrosulfite.** $Na_2S_2O_4.2H_2O$ = 210.1. Colorless crystals, decomp. at red heat; soluble in water, insoluble in alcohol. **s. hydroxide.** NaOH = 40.01. S. hydrate, soda, caustic soda, sodii hydroxidum (U.S.P.). A white, very hygroscopic powder, or white flakes, plates, pellets, or sticks, d.2.13, m.318; very soluble in water, alcohol, or ether. Used extensively in chemistry, the chemical industry, metallurgy, photography, and sold in various degrees of purity:

(1) reagent from sodium—for special analytical work.
(2) reagent from alcohol—for general analytical work, volumetric solutions, etc.
(3) reagent, purified—for general analytical and chemical work.
(4) U.S.P. or B.P.—for pharmaceutical work.
(5) technical—fused or in flakes for industrial purposes.

s. hydroxide solution. An aqueous solution of s. hydroxide. Commercial grades:

(1) 31 % solution, d.1.34
(2) 27 % solution, d.1.30
(3) 15 % solution, d.1.17
(4) 5 % solution, d.1.06

The solutions employed in the laboratory have the following strengths:

6M solution—240.03 gm. NaOH per 1000 cc.
N or M solution—40.005 grams NaOH per 1000 cc.
N/2 solution—20.0025 grams NaOH per 1000 cc.
N/10 solution—4.0005 grams NaOH per 1000 cc.

s. hydroxide with lime. Soda-lime. A mixture of sodium hydroxide and calcium oxide. A white granular powder, or porous mass; used as a reagent, as a general absorbent for acid gases and carbon dioxide in particular, in absorption tubes and in scrubbers. **s. hydroxylamine sulfonates.** mono- $HO.NH(SO_3Na)$ = 135.40. di- $HO.N.(SO_3Na)_2$ = 237.16. **s. hypobromite.** NaOBr = 119.0. A colorless powder, soluble in water; used as an oxidizer in organic synthesis. **s. hypochlorite.** NaOCl = 74.5. A colorless powder, decomp. by heat, soluble in water, decomposed by ether. Used as a reagent, an oxidizing agent, and a bleaching agent. Cf. *Eau de Javelle, Carrel-Dakin-, Dakin-, Labarraque solutions*. **s. hyponitrite.** $Na_2N_2O_2$ = 106.0. A colorless crystalline powder; soluble in water. **s. hypophosphite.** $NaH_2PO_2.H_2O$ = 106.1. Colorless deliquescent monoclinic prisms or white granular powder, soluble in water, alcohol or ether. Used as a reagent in gas analysis, and medicinally as a tonic. **s. hyposulfate.** (1) $Na_2S_2O_6.2H_2O$ = 242.1. Sodium dithionate. Large, transparent rhombic prisms; soluble in water, insoluble in alcohol. (2) S. thiosulfate. **s. hyposulfite.** (1) $Na_2S_2O_4$ = 174.1. S. hydrosulfite. Colorless crystals, soluble in water; used to recover silver from photographic waste. (2) S. thiosulfate. (3) S. bisulfite. **s. indigotinsulfonate.** Indigo carmine. **s. iodate.** $NaIO_3$ = 197.9. A white powder, d.4.277, decomp. by heat, soluble in water, insoluble in alcohol or ether; used as a reagent. It may contain 5 mols.

of water of crystallization. **s. iodide.** NaI = 149.9. Colorless cubic crystals, d.3.665, m.664, soluble in water, alcohol or ether; used as a reagent, and medicinally as an alterant. *dihydrate.* $NaI.2H_2O$ = 185.9. Colorless crystals, d.2.448; soluble in water, alcohol or ether. **s. iodoeosin.** Erythrosin. **s. iodotheobromate.** Theobromine sodium iodide. **s. ion.** The monovalent cation, Na^+. **s. iridichloride.** Iridium sodium chloride. **s. iron pyrophosphate.** $Na_8Fe_2(P_2O_7)_3$ = 818.4. Used as a catalyst in carbohydrate oxidation. **s. lactate.** $NaC_3H_5O_3$ = 112.06. A thick syrup-like liquid, soluble in water or alcohol; used medicinally. **s. lauryl sulfate.** $NaC_{12}H_{25}SO_4$ = 288.3. Irium. A white powder, used as detergent in toothpastes. **s. lorinate.** Griserin. A yellowish powder, soluble in water; used medicinally. **s. lygosinate.** The sodium salt of diorthocumareketone (see *lygosin*). **s. magnesium tartrate.** $Na_2Mg(C_4H_4O_6)_2.10H_2O$ = 546.53. A white powder, soluble in water. **s. malate.** $Na_2C_4H_4O_5$ = 178.1. Colorless crystals, soluble in water. **s. malonic ester.** $NaC_7H_{11}O_4$ = 182.1. Sodio-malonic ester, EtO(NaO)C:CH.COOEt. White needles. Formed, but not usually isolated, in the malonic ester synthesis. **s. manganate.** $Na_2MnO_4.10H_2O$ = 345.1. Green monoclinic crystals, decomp. by heat; soluble in water, decomp. by alcohol. **s. metabisulfite.** $Na_2S_2O_5$ = 190.14. White crystals, soluble in water; used in photography. **s. metaborate.** See *s. borates.* **s. metantimonate.** $Na_2H_2Sb_2O_5$ = 400.0. S. hydropyroantimonate. A white granular powder; slightly soluble in hot water. **s. metaphosphate.** $NaPO_3$ = 101.98. Exists in two crystalline forms, one sol. in water (s. trimetaphosphate), other insol. On melting either form and quickly cooling, a water-sol. glass. (Graham's salt), is obtained. **s. metasilicate.** See *s. silicates.* **s. metastannate.** $Na_2Sn_5O_{11}.4H_2O$ = 887.6. A crystalline powder, insoluble in alcohol. **s. metavanadate.** $NaVO_3$ = 122.2. A pale-green crystalline powder, soluble in hot water; used as a reagent, and medicinally. **s. methyl arsenate.** See *methyl.* **s. methyl arsenite.** $Na_2CH_2AsO_3$ = 184.0. Disodium methylarsonate, mono-methyldisodiumarsenate, arrhenal, arsynal, neoarsycodyl, stenosine. Colorless crystals, m.135, soluble in water, slightly soluble in alcohol, insoluble in ether; used medicinally instead of cacodylates. **s. methylate.** $NaCH_3O$ = 54.0. MeONa. A white powder, decomp. by water; soluble in alcohol. **s. methylsulfate.** $NaCH_3SO_4$ = 134.09. Colorless hygroscopic crystals; soluble in water or alcohol. **s. molybdate.** $Na_2MoO_4.2H_2O$ = 242.0. Colorless leaflets with mother-of-pearl luster, soluble in water; used as a reagent. **s. molybdophosphate.** S. phosphomolybdate. **s. monosulfide.** S. sulfide. **s. monoxide.** S. oxide, Na_2O. **s. morrhuate.** The sodium salt of a fraction of the fatty acids of codliver oil having a high iodine content; used to treat varicose veins. **s. naphthionate.** S. naphthylamine sulfonate. **s. naphtholsulfonate.** $NaC_{10}H_7SO_4$ = 246.1. S.-β-naphthol-α-sulfonate. White tablets; soluble in water or alcohol. **s. naphthoquinone sulfonate.** A white powder, used as reagent for nitrogen in amino acids. **s. naphthylaminesulfonate.** $NaC_{10}H_6.NH_2.SO_4$ = 261.1. S. naphthionate. Colorless monoclinic prisms, soluble in water; used as a reagent for nitrous acid. **s. nitranilate.** $Na_2C_6O_8N_2$ = 274.02. S. dinitrodioxyquinonate, $C_6(NO_2)_2O_2(ONa)_2$. A brown powder; soluble in water. **s. nitrate.** $NaNO_3$ = 85.01. Saliter. Soda nitre, cubic nitre, caliche, Chile saltpetre. Colorless rhombohedral crystals, d.2.265, m.312, soluble in water, slightly soluble in alcohol. Used as a reagent and oxidizer in organic synthesis, in the manufacture of acids, fertilizers, explosives and glass, as a flux in metallurgy, and medicinally. **s. nitrite.** $NaNO_2$ = 69.01. Colorless crystals or white, slightly yellow sticks, d.2.167, m.271; soluble in water, slightly soluble in alcohol, ether, or benzene. Used as a reagent, in the manufacture of azodyes and synthetics; and medicinally as a diuretic and diaphoretic; also for sea-sickness. Cf. *mystin.* **s. 5-nitro-6-chlorotoluene-3-sulfonate.** A white powder, a reagent for potassium. **s. nitroferricyanide.** $Na_2Fe(CN)_5NO.2H_2O$ = 297.8. S. nitroprusside. Dark red, transparent crystals, d.1.680, soluble in water. Used as a reagent for alkali sulfides, acetone, formaldehyde, aminoacids, and alkaloids. **s. nitronaphthalenesulfonate.** $NaC_{10}H_6(NO_2)SO_3$ = 275.0. A brownish-yellow powder, soluble in water; used in organic synthesis. **s. nitroprussiate.** S. nitroferricyanide. **s. nitroprusside.** S. nitroferricyanide. **s. nitrosohydroxylamine sulfonate.** $ON.N(ONa)SO_3Na$ = 186.09. **s. nucleate.** S. nucleinate. **s. nucleinate.** S. nucleate. The sodium salt of nucleic acids of yeast. A grayish-white powder, soluble in water and insoluble in alcohol; used medicinally as a tonic and for syphilis. **s. oenanthate.** $NaC_7H_{13}O_2$ = 152.1. The sodium salt of n-heptylic acid, $Me(CH_2)_5COONa$. A white crystalline powder, soluble in alcohol or water. **s. oleate.** $NaC_{18}H_{33}O_2$ = 304.3. Yellow, unctuous granules; soluble in water or alcohol. **s. orthoaminobenzoate.** S. anthranilate. **s. orthovanadate.** See *s. vanadate.* **s. oxalate.** $Na_2C_2O_4$ = 134.0. A white crystalline powder, soluble in water. Used as a reagent, and in the manufacture of stain and ink removers. *acid-* $NaOOC.COOH.H_2O$ = 130.02. Colorless monoclinic crystals, soluble in water. **s. oxide.** Na_2O = 62.0. S. monoxide. A grayish or white mass, d.2.7, subliming and m. at red heat, and decomp. by water (to form sodium hydroxide), alcohol or ether. Used as a reagent and strong base, similarly to sodium hydroxide. **s. para-periodate.** $Na_3H_2IO_6$ = 293.9. A crystalline solid, used as an oxidising agent in quantitative analysis. **s. pentasulfide.** See *s. sulfides.* **s. pentobarbital.** White powder, used for seasickness. **s. pentoxydichloride.** $Cl.SO_2O.SO_2Cl$ = 215.4. A straw-colored liquid, b.150, slightly soluble in cold water, but reacting violently with warm water. **s. perborate.** $NaBO_3.4H_2O$ = 154.1. Peroxydol. A white crystalline powder; soluble in water. Used as a reagent, oxidizing agent, antiseptic, deodorant and bleaching agent for textiles, rayon and vat colors; also in dentifrices and detergents. **s. percarbonates:** (1) *normal* $Na_2C_2O_6$ = 166.00. (2) *mono-* Na_2CO_4 = 122.00. **s. perchlorate.** $NaClO_4$ = 122.5. Colorless rhombohedral crystals, m.482, decomp. by further heat, soluble in water, alcohol or ether; used as a reagent, and in explosives. **s. periodate.** $NaIO_4.3H_2O$ = 267.9. Efflores-

cent hemihedral crystals, d.$_{18}$3.219, dehydrated at 300, soluble in water. **s. permanganate.** $Na_2MnO_4.3H_2O$ = 218.98. Purple or reddish-black crystals, decomp. by heat; soluble in water or alcohol. Used as a reagent and oxidizing agent, and medicinally as an antidote to poisoning from snake bites, morphine or curare. **s. peroxide.** Na_2O_2 = 78.0. S. dioxide, s. superoxide. A white or yellowish powder, d.2.805, decomp. by heat, soluble in water with production of heat, sodium hydroxide and hydrogen peroxide. Used as a powerful oxidizer for destroying organic matter in analysis; as a flux for minerals; in bleaching animal or vegetable tissues, *e.g.*, flour; in the preparation of calcium peroxide, sodium perborate and ferrate. It should be used with caution, as it is liable to ignite organic matter or alcohol. **s. persulfate.** $Na_2S_2O_8$ = 238.0. A white crystalline powder, soluble in water. Used as a reagent for indican, adrenalin and other organic substances, as a strong antiseptic and bleaching agent; and medicinally as an aperient. **s. phenate.** NaC_6H_5O = 116.0. S. carbolate, PhONa. A colorless hygroscopic powder, soluble in water; used medicinally as an antiseptic. **s. phenolphthaleinate.** $Na_2C_{20}H_{12}O_4$ = 362.1. A red syrupy mass; soluble in water. **s. phenolsulfonate.** $NaC_6H_5O_4S$ = 196.1. S. p-phenolsulfonate, s. sulfocarbolate, $C_6H_4(OH)SO_3Na$. Colorless crystals, soluble in water and slightly soluble in alcohol; used medicinally as an antiseptic and disinfectant. **s. phenylethyl barbiturate.** Luminal-sodium, phenobarbital sodium, the monosodium salt of luminal. A white, hygroscopic powder, m.147, soluble in water; used medicinally as a hypnotic. **s. *o*-phenylphenate.** $C_{12}H_9ONa$ = 192.1. $Ph.C_6H_4ONa$. A white powder, used as preservative of glues. Cf. *phenylphenol*. **s. phosphates:**

(1) $Na_3PO_4.12H_2O$ = 380.2, tribasic
(2) Na_2HPO_4 = 142.0, dibasic, anhydrous
(3) $Na_2HPO_4.12H_2O$ = 358.2, dibasic, hydrous
(4) $NaH_2PO_4.H_2O$ = 138.1, monobasic
(5) $NaPO_3$ = 101.98, metaphosphate
(6) $Na_4P_2O_7.10H_2O$ = 446.24, pyrophosphate

(1) *tribasic-* S. orthophosphate. Colorless hexagonal crystals, d.1.644, m.77; soluble in water. (2) *dibasic*, anhydrous- Sörensen's sodium phosphate, disodium orthophosphate. A white hygroscopic powder, soluble in water; used as a reagent, and in buffer solutions. (3) *dibasic*, hydrous- Disodium orthophosphate. Monohydrogen sodium phosphate. Colorless, transparent rhombic crystals, d.1.52, m.35, soluble in water, insoluble in alcohol or ether; used as a reagent. (4) *monobasic-* Monosodium orthophosphate, dihydrogen sodium phosphate, sodium biphosphate. Large colorless, transparent, rhombic crystals, d.2.04, soluble in water, insoluble in alcohol; used medicinally. (5) *metaphosphate-* Insoluble form, colorless crystals; soluble form, colorless crystals, d.2.476, m.627; soluble glass obtained by quenching from melt. Cf. *s. metaphosphate*. (6) *pyrophosphate-* Colorless monoclinic crystals, d.1.836, m.988, soluble in water, insouble in alcohol or ether; used as a reagent and in the manufacture of pharmaceuticals. (7) *tetraphosphate-* $Na_6P_4O_{13}$. **s. phosphide.** Na_3P = 100.04. A red solid which evolves phosphine with water; decomp. by heat. **s. phosphites.** There are three phosphites: Na_3PO_3, Na_2HPO_3 and NaH_2PO_3. The most common is $Na_2HPO_3.5H_2O$ = 216.2. Colorless rhombohedral crystals, m.53, soluble in water, insoluble in alcohol or ether. **s. phosphomolybdate.** $Na_3PO_4.10MoO_4$ = 1764.0. S. molybdophosphate. A yellow crystalline powder, soluble in water. Used as a reagent for alkaloids and vegetable fats, and in microscopy. **s. phosphotungstate.** $Na_4P_2O_7.12WO_3.18H_2O$ = 3374.0. S. phosphowolframate. A white granular powder, soluble in water. Used as a reagent for alkaloids, potassium, ferrous salts and uric acid. **s. phosphovanadate.** $Na_4P_2O_7.6V_2O_5.21H_2O$ = 1736.4. A yellow crystalline powder, soluble in water; used as a microscope reagent. **s. phosphowolframate.** S. phosphotungstate. **s. phthalate.** $C_6H_4(COONa)_2$ = 210.03. A white powder, slightly soluble in water. **s. platinichloride.** $Na_2PtCl_6.6H_2O$ = 562.1. S. platinic chloride. A red solid, m.100, soluble in water or alcohol. **s. platinochloride.** Na_2PtCl_4 = 383.04. S. platinous chloride. A dark brown crystalline solid. **s. platinocyanide.** Platinous sodium cyanide. **s. plumbate.** $Na_2PbO_3.3H_2O$ = 351.9. A yellow amorphous powder, decomp. by water. **s. potassium carbonate.** $NaKCO_3.6H_2O$ = 230.2. Colorless monoclinic crystals, d.1.6334, soluble in water. **s. potassium tartrate.** Potassium s. tartrate. **s. propionate.** $NaC_3H_5O_2$ = 96.04. Et.COONa. A white granular powder; soluble in water or alcohol. **s. pyroantimonate.** $H_2Na_2Sb_2O_7.6H_2O$ = 508.5. A colorless powder; slightly soluble in water, alcohol or ether. **s. pyroborate.** See *s. borates*. **s. pyrophosphate.** See *s. phosphates*. **s. pyrosulfate.** $Na_2S_2O_7$ = 284.2. S. disulfate. Colorless crystals; soluble in water. **s. pyrosulfite.** $Na_2S_2O_5$ = 190.1. A colorless crystalline powder; soluble in water. **s. rhodanate.** S. thiocyanate. **s. rhodanide.** S. thiocyanate. **s. rosolate.** $NaC_{20}H_{15}O_3$ = 326.1. S. corallinate, the sodium salt of trihydroxy-diphenyl-tolylcarbinol. A dark-red powder with greenish luster, soluble in water; used as a stain in microscopy. **s. saccharate.** $NaC_{12}H_{21}O_{11}$ = 364.2. A white powder, soluble in water; used medicinally in ampoule medication. **s. salicylate.** $NaC_7H_5O_3$ = 160.1. White scales or crystalline powder, soluble in water, slightly soluble in alcohol or ether. Used as a reagent for free acid in gastric juice; and medicinally, as an antirheumatic and antipyretic. **s. salicylsulfonate.** S. sulfosalicylate. **s. santonate.** $NaC_{15}H_{19}O_4$ = 286.2. A colorless hygroscopic powder, soluble in water or alcohol; used medicinally as an anthelminthic. **s. santoninate.** $NaC_{15}H_{19}O_4.3\frac{1}{2}H_2O$ = 353.1. Colorless crystals; soluble in water or alcohol. Used medicinally as an anthelminthic. **s. selenate.** $Na_2SeO_4.10H_2O$ = 369.3. White crystals, soluble in water; used as a reagent. **s. selenite.** Na_2SeO_3 = 173.1. A colorless powder, soluble in water, insoluble in alcohol. Used as a reagent in bacteriology, and in the manufacture of red glass. **s. sesquicarbonate.** See *sesquicarbonate of soda*. **s. silicate.** *solid-* Na_2SiO_3 = 122.3. S. metasilicate. Colorless monoclinic crystals, or a white to grayish powder, m.1056, soluble in water and insoluble in alcohol; used similarly to the liquid. *liquid-* $Na_2Si_4O_9.xH_2O$ = 303.2 + 18x. Water glass, soluble glass. An amorphous powder or thick, heavy liquid aqueous solution, soluble in water,

insoluble in alcohol. Used as an adhesive in the paper industry; as binder in acid proof cements, cold water paints, abrasives; as a protective coating on waterproofing cements, concrete, wood, or paper utensils; as a preservative for eggs; in the chemical industry, for the manufacture of soap, boiler compounds, paper sizings, road binders; in the textile industry for in bleaching and cleaning fabrics, milk bottles, and greasy glass. *tetra-* See *s. tetrasilicate.* **s. silicofluoride.** Na_2SiF_6 = 188.3. S. fluosilicate, salufer. A white granular powder, d.2.73, slightly soluble in water, insoluble in alcohol or ether. Used as a reagent, antiseptic and germicide. **s. silver cyanide.** S. argentocyanide. **s. silvinate.** S. sylvate. **s. sozoiodolate** $C_6H_2I_2(ONa)SO_3H$ = 447.7. Sozoiodolesodium. A colorless crystalline powder, soluble in water, alcohol or glycerol; used medicinally as an antiseptic. **s. stannate.** $Na_2SnO_3.3H_2O$ = 266.7. White hexagonal crystals, soluble in water, insoluble in alcohol or ether; used as a mordant in dyeing. **s. stannite.** $HSnOONa$ = 174.71. A compound known only in solution, and analogous to s. formate. **s. stearate.** $NaC_{18}H_{35}O_2$ = 306.3. A white, unctuous powder; soluble in water; used in pharmaceutical preparations. **s. succinate.** (1) $Na_2C_4H_4O_4$ = 162.2. A colorless powder; soluble in water. (2) $Na_2C_4H_4O_4.6H_2O$ = 270.3. Colorless monoclinic prisms, soluble in water; used medicinally. **s. sulfalizarate.** Alizarin red. **s. sulfanilate.** $NaC_6H_4(NH_2)SO_3.2H_2O$ = 231.1. S. anilinesulfonate, s.-p-aminebenzene sulfonate. Colorless lustrous flakes, soluble in water; used medicinally. **s. sulfantimonate.** $Na_3SbS_4.9H_2O$ = 479.4. Schlippe's salt, s. thioantimonate. Large colorless tetrahedral crystals, soluble in water decomp. by heat; used as a reagent for alkaloids. **s. sulfates:**

(1) Na_2SO_4 = 142.1, normal, anhydrous.
(2) $Na_2SO_4.H_2O$ = 160.1, normal, monohydrate.
(3) $Na_2SO_4.7H_2O$ = 268.2, normal, heptahydrate.
(4) $Na_2SO_4.10H_2O$ = 322.2, normal, decahydrate.
(5) $NaHSO_4$. See *s. bisulfate.*

(1) *anhydrous-* Salt cake, niter cake, native as thenardite. A colorless powder, d.2.673, m.884, soluble in water, insoluble in alcohol. (2) *monohydrate-* Native as mirabilite. A white powder, soluble in water. (3) *heptahydrate-* Colorless rhombic or tetragonal crystals, soluble in water and insoluble in alcohol. (4) *decahydrate-* Glauber's salt, ordinary sodium sulfate. Colorless monoclinic crystals, d.1.462, m.38, soluble in water, insoluble in alcohol; used as a reagent, as a precipitant, and medicinally as a cathartic and diuretic. **s. sulfhydrate.** $NaHS$ = 56.0. S. hydrosulfide, s. hydrosulfate. Colorless crystals, soluble in water; used as a reagent. **s. sulfides:** (1) Na_2S = 78.1. Anhydrous s. monosulfide. An amorphous, slightly pink powder, d.2.471; soluble in water, slightly soluble in alcohol, decomp. by heat. (2) $Na_2S.9H_2O$ = 240.3. Colorless hygroscopic crystals, soluble in water. Used as a reagent instead of hydrogen sulfide. The following polysulfides are also known:

(3) Na_2S_2 = 110.1, s. disulfide
(4) Na_2S_3 = 142.2, s. trisulfide
(5) Na_2S_4 = 174.2, s. tetrasulfide
(6) $Na_2S_5(+8H_2O)$ = 206.4, s. pentasulfide.

s. sulfites: (1) Na_2SO_3 = 126.1 (*anhydrous*). Colorless hexagonal prisms, d.2.633, m.150 decomp. by further heat, soluble in water, insoluble in alcohol; used as a reagent and reducing agent. (2) $Na_2SO_3.7H_2O$ = 252.2 (*heptahydrate*). Colorless prismatic crystals, m.100 (decomp.), soluble in water, insoluble in alcohol. Used as a reagent, preservative, and medicinally, as an antiseptic and antizymotic. **s. sulfocaffeinate.** Symphorol N. **s. sulfocarbolate.** S. phenolsulfonate. **s. sulfocarbonate.** Na_2CS_3 = 154.2. S. trithiocarbonate. A granular brown powder; soluble in water; used as an insecticide, antiseptic and reagent for nickel and cobalt. **s. sulfocyanate.** **s. thiocyanate.** **s. sulfocyanide.** S. thiocyanate. **s. sulfo-oleate.** Thigenol. **s. sulfosalicylate.** $NaC_7H_5O_3SO_3$ = 240.0. S. salicylsulfonate. A white crystalline powder, soluble in water, insoluble in alcohol; used medicinally as an antiseptic. **s. sulfovinate.** S. ethylsulfate. **s. sulfoxylate formaldehyde.** $NaHSO_2.CH_2O.2H_2O$ = 154.11. White rhombic prisms, m.64, very soluble in water; used as a reagent. **s. superoxide.** S. peroxide. **s. sylvate.** $NaC_{20}H_{29}O_2$ = 324.3. S. abietinate, s. silvinate. A white powder, soluble in water or alcohol; used medicinally. **s. tannate.** $NaC_{14}H_9O_9$ = 344.1. A dark brown powder; soluble in water. **s. tartrate.** $Na_2C_4H_4O_6.2H_2O$ = 230.1. White, trimetric crystals, d.1.794, soluble in water, insoluble in alcohol; used as a reagent, and medicinally as a cathartic and refrigerant. **s. taurocholate.** (1) $NaC_{26}H_{44}NSO_7$ = 537.5. A yellowish-gray powder, soluble in water or alcohol, from the bile of carniverous animals; used as a diagnostic reagent. (2) The B.P. Codex term for bile salts, q.v. **s. tellurate.** $Na_2TeO_4.5H_2O$ = 327.6. A white powder; soluble in water. **s. tellurite.** Na_2TeO_3 = 221.5. A white powder, slightly soluble in water; used in bacteriology. **s. tetraborate.** See *s. borates.* **s. tetraiodophenolphthalein.** Antinosin. **s. tetrasilicate.** $Na_2Si_4O_9$ = 302.2. An amorphous colorless solid, soluble in water. **s. tetrathionate.** $Na_2S_4O_6$ = 270.28. A white soluble solid. **s. tetravanadate.** S. divanadate. **s. thioantimonate.** S. sulfantimonate. **s. thioarsenate.** $2Na_3AsS_4.15H_2O$ = 814.74. A soluble solid. **s. thiocarbonate.** Na_2CS_3 = 154.21. A heavy brown oil. It is the sulfur analogue of s. carbonate. **s. thiocyanate.** $NaSCN$ = 81.1. S. sulfocyanate. S. sulfocyanide, s. rhodanate, s. rhodanide. White deliquescent rhombic crystals, m.287, soluble in water; used as a reagent, especially for ferric ions. **s. thiophenesulfonate.** $NaC_4H_3O_3S_2.H_2O$ = 209.1. A white powder, soluble in water; used as an antiseptic. **s. thiosulfate.** $Na_2S_2O_3.5H_2O$ = 248.20. S. hyposulfite, s. subsulfite, antichlor. Colorless monoclinic crystals, d.1.729, m.32–48, decomp. 220; soluble in water, insoluble in alcohol or ether. Used as a reagent, for volumetric solutions, as a group precipitant instead of hydrogen sulfide, as "antichlor" in paper making and bleaching, as mordant, in metallurgy, in photography as a fixing salt, and in mining as a solvent for lead and silver; medicinally as a detoxicant for metallic poisons. **s. thiotetraphosphate.** $Na_6P_4O_{10}S$ = 454.3. A detergent. **s. thymol benzoate.** Porphyrin. **s. titanates:** $(Na_2O)_2.TiO_2$; $Na_2O.TiO_2$, and $Na_2O.(TiO_2)_2$. **s.**

trichloracetate. $NaC_2O_2Cl_3$ = 185.4. CCl_3COONa. Colorless crystals; soluble in water. **s. trichlorophenate.** $C_6H_2Cl_3ONa$ = 219.4, Dowicide B. A white crystralline powder, soluble in water; used as a mold fungicide, and medicinally as an antiseptic. **s. trithiocarbonate.** S. sulfocarbonate. **s. triticonucleinate.** The sodium salt of nucleic acids from wheat. A grayish-white powder, soluble in water. **s. truxillate.** $Na_2C_{18}H_{14}O_4.10H_2O$ = 520.2. A white powder; soluble in water. **s. tungstate.** $Na_2WO_4.2H_2O$ = 330.0. S. wolframate. Colorless rhombic prisms, m.100, soluble in water. Used as a reagent for alkaloids, bile pigments and tannins, and for waterproofing and fireproofing textiles. **s. uranate.** Na_2UO_4 = 348.20. Uranium yellow. An orange-yellow, rhombic, crystalline powder; soluble in water or acids. Used as a reagent, and in the manufacture of green glass, enamels and porcelain pigments. **s. urate.** $Na_2C_5H_2O_3N_4.H_2O$ = 230.1. A white, granular powder; slightly soluble in water. *acid-* $NaHC_5H_2N_4O_3$ = 190.05. A white granular powder, slightly soluble in water. **s. valerate.** $NaC_5H_9O_2$ = 124.1. Colorless crystals, soluble in water or alcohol; used medicinally as a sedative. **s. vanadate.** Na_3VO_4 = 184.2. S. *ortho*vanadate. A colorless crystalline powder, soluble in water. Used as a reagent and in the manufacture of inks and dyes. *meta-* See *s. metavanadate.* **s. wolframate.** S. tungstate. **s. xanthogenate.** $NaS(OC_2H_5)C{:}S$ = 144.1. A yellow powder, soluble in water or alcohol; used medicinally as an antiseptic and germicide. **s. zincate.** Na_2ZnO_2 = 143.4. A white amorphous powder, soluble in alkalis; decomp. by water into $Zn(OH)_2$ and NaOH.

sodos. A mixture of sodium dihydrogen phosphate and sodium bicarbonate; used medicinally.

sodyl. The monovalent NaO—radical. **s. hydroxide.** NaOOH = 56.01. A white powder, which explodes if heated.

soft-sized paper. Bibulous or blotting paper.

softener. (1) A substance which when added to another substance increases the plasticity of the latter. They are either true s. or lubricants; as, stearic acid or pine tar for rubber, respectively. (2) An agent used in water-softening, q.v. (3) A substance added to paper or glue to make it more pliable and prevent warping; as, diethylene glycol. (4) A substance imbibed by cellophane or cotton cellulose making it less brittle; as, glycerol and glycols. **anti-** A substance which stiffens; as, benzidine in rubber.

softening. (1) Making plastic. (2) Removing salts. **water-** See soft *water, permutite.*

s. temperature. The transition point at which substances without a sharp melting-point change from viscous flow into plastic flow, as determined by the plastometer.

softifume. A mixture of NaCN, $NaClO_3$ and sand, which is pressed into bricks and used in fumigation by dropping it into HCl to liberate HCN.

sogasoid. A dispersed system which consists of a solid phase in a gaseous phase, or solid colloidal particles suspended in air or a gas (as, smoke).

soil. The surface layer of the earth, which consists of the weathered mineral and rock fragments of diverse origin, mixed with decaying and decomposed vegetable and animal matter. Cf. *humus, subsoil.* See tables.

SOILS

	Lime	*Sand*	*Clay*	
lime poor	0–15	80–100	0	flying sand
			10	loose sand
			20	clay sand
		30–50	30	sandy loam
			40	mild loam
			55	strong loam
		0–30	65	mild clay
			75	common clay
			90	strong clay
lime rich	15–20	25–50	20–50	loamy soil
		0–25	50–75	clayey soil
	15–60	40–80	.....	sandy soil
	50–75	little	.....	calcareous soil
	75–95	little	.....	lime soil.

gravel—particles over		2	mm. diam.
coarse sand—	" 0.2	–2.0	mm. diam.
fine sand—	" 0.02	–0.20	mm. diam.
silt—	" 0.002	–0.02	mm. diam.
clay—	" below 0.002		mm. diam.

s. amendment. A material added to soil to improve its physical or chemical character and productivity other than by the plant nutrients. E.g., lime added to correct acidity or to promote flocculation of colloidal clay; sand added to prevent hardening of clay. **s. bacteria.** An important group of protophyta that enrich the soil by the ammonification and nitrification of nitrogen compounds. *E.g., Bacillus mycoides, B. proteus vulgaris, B. mesentericus, B. subtilis, B. janthinus, B. coli communis, B. megatherium, B. fluorescens.* Cf. *azobacter, acetobacter, nitrobacter, nitromonas, nitrosomonas, nitrogen cycle.* **s. science.** Pedology. The study of the surface layer of the earth.

soja. Soy bean.

sol. (1) A colloidal solution. (2) The liquid phase of a colloidal solution. **aero-** A colloidal system in which the surrounding phase is a gas; *e.g.*, smoke, fog. **collo-** Collosol. **electro-** Electrosol. **hydro-** A colloidal suspension in which the liquid phase is water. (See *gel*). **sulfo-** See *sulfosol.*

Solanaceae. Nightshade family, a group of herbs or shrubs with rank-scented, often poisonous foliage, and a colorless juice containing alkaloids. Cf. *solanum.*

Roots:	
Atropa belladonna.....	deadly nightshade, atropine
Brunfelsia hopeana....	manaca
Mandragora officinalis	mandragorine
Scopola carniolica.....	scopola
Leaves:	
Datura stramonium...	thornapple, stramonium
Hyoscyamus niger.....	henbane, hyoscine, hyoscyamine
Nicotiana tabacum....	tobacco, nicotine
Duboisia myoporoides.	duboisine
Duboisia hopwoodii...	pituri
Branches:	
Fabiana imbricata.....	pichi
Solanum dulcamara...	bittersweet, solanin
Fruits:	
Capsicum frutescens...	cayenne pepper
Lycopersicum esculentum.....	tomato

s. alkaloids. The alkaloids obtained from various species of Solanaceae.

atropine	$C_{17}N_{23}O_3N$
hyoscyamine	$C_{17}H_{23}O_3N$
hyoscine	$C_{17}H_{21}O_4N$
atroscine	$C_{17}H_{21}O_4N$
atropamine	$C_{17}H_{21}O_2N$
belladonine	$C_{17}H_{21}O_2N$
mandragorine	$C_{16}H_{19}O_2N$
meteloidine	$C_{13}H_{21}O_4N$

Cf. *grandiflorine, hypaphorine, lycine, natrine, noratropine, solandrine, solanine.*

solandrine. An alkaloid derived from *Solandra lavis.* It resembles hyoscine.

solanellic acid. $C_{23}H_{34}O_{12}$ = 502.2. A hexabasic acid formed on oxidation of bile acids.

solanidine $C_{27}H_{43}O_3N$ = 397.4. A decomposition-product of solanine. Colorless crystals, m.208, soluble in alcohol or ether.

solanin. $C_{45}H_{73}O_{15}N$ = 867.7. A glycoside from *Solanum nigrum,* potato and other species. Colorless, microcrystalline powder, m.280, slightly soluble in water; used medicinally as a nerve sedative.

solanine. $C_{52}H_{91}O_{18}N$ = 1017.7. An alkaloid in Solanaceae; decomp. 254.

solanorubin. Licopene.

Solanum. A genus of herbs and shrubs of the family Solanaceae. It includes the nightshades, potatoes, and other species. **S. carolinense.** Solanum, horse nettle, poison potato, sand brier, bull nettle. The air-dry ripe fruits of S.c., a Solanaceae of the Southern States; used medicinally, as the fluid extract, as a sedative. **S. dulcamara.** Bittersweet. **S. grandiflora.** S. yielding grandiflorine, q.v. **S. insidiosum.** Jurubeba. The root of S.i., a Solanaceae of Brazil; used medicinally as a stomachic and diuretic. **S. melongena.** The egg-plant of the tropics. **S. nigrum.** The common garden nightshade. **S. tomatillo.** S. yielding natrine, q.v. **S. tuberosum.** The common potato.

solar. Pertaining to the sun. **s. constant.** The amount of energy from the sun falling at normal incidence per 1 sq. cm. per minute, on a body at the earth's mean distance from the sun. It equals 1.932 small calories. **s. evaporation.** The concentration of a solution, as sea water, by the sun's heat. Cf. *evaporator.* **s. pond.** The flat areas surrounded by low dykes in which sea water is evaporated; as in California and Eritrea. **s. radiation.** See *radiation.* **s. rays.** The visible and invisible radiations of the sun. **s. spectrum.** The spectrum produced when sunlight is refracted by a prism or grating. It is characterised by the dark Fraunhofer lines. (See *spectrum.*) **s. year.** The ordinary year, q.v.

solargentum. A compound of silver and gelatin; black, lustrous granules, used medicinally.

solarization. (1) Exposure to the sun; as of a photographic plate or the accelerated ageing of rubber and celluloid articles. Cf. *irradiation.* (2) A decrease or complete disappearance of starch following long exposure to light, of plant leaves which previously formed abundant starch.

solate. A liquefied gel.

solation. The liquefaction of a gel; the reverse of gelation.

solbrol. Nipagin.

solder. Braze. A fusing metal or alloy used to unite adjacent surfaces of less fusible metals or alloys. **brass-** Copper s. **copper-** An alloy of 2 parts lead and 5 parts tin, using zinc chloride or resin as flux. **fine-** Soft s. **fusible-** An alloy of lead, tin, and bismuth, which melts in water and is also used in fire-spray extinguishers. See *Mellot's metal.* **gold-** An alloy of 4 parts copper, 6 parts silver and 10 parts gold. **hard-** A high melting-point alloy, used as s.; it fuses at red heat. *E.g.,* Cu + Zn + Ag. **lead-** An alloy of equal parts of lead and tin, used for soldering lead. **plumber's-** An alloy usually containing approx. Pb 65, Sn 30 %, with some Sb. **silver-** An alloy of silver, zinc and copper. **soft-** Any low melting s. which fuses below red heat, as Sn + Pb, *lead s. fusible s.* **zinc-** An alloy of 3 parts lead and 5 parts tin.

soldering. Brazing. The act of uniting metallic pieces by heat, with or without an alloy (solder) and flux (borax). **autogenous-** The union of metal surfaces by interfusion, without the addition of a more fusible alloy. **fusing-** The union of metal surfaces by filling all intervening space with a completely fused solder. **sweating-** S. in which the solder is heated near its melting point and then adheres to the metal surface without being completely fused.

Solenhofen stone. A fine-grained porous limestone, which contains clay.

solenoid. Selenoid.

solfatara. A volcanic vent from which deposits of sulfur are obtained.

solferino. Fuchsin.

solid. (1) A substance of definite shape, and relatively great density, lower internal heat content, greater cohesion of its molecules. It may be homogeneous (as crystals and solid solutions); or heterogeneous (as amorphous and colloidal substances). It differs from the liquid or gaseous state by reason of its slower molecular motions. **s. solution.** (1) Sosoloid. A completely homogeneous solidified mixture of substances; as, glass. (2) A solution of a solid, liquid, or gas in a solid, which is itself a solid.

solidago. Golden rod. The dried herb of *Solidago odora,* a Compositae. Used medicinally as a diaphoretic, stimulant, carminative and diuretic. The flower causes a form of hay fever.

solidify. To change into the solid state. Cf. *heat of solidification.*

solidifying point. Freezing point.

solidus. In a temperature-concentration diagram where there are both solid and liquid solutions, though the concentration of the two components are not the same, two curves are required for each system; the *s.* relates to the solid phase and the *liquidus* to the liquid phase. Cf. *diagram.*

soliquoid. A dispersed system which consists of a solid phase in a liquid phase. Solid colloidal particles suspended in a liquid; hence, a suspension.

solodization. Dealkalization, or the removal of alkali from soils by degradation.

solomon's seal. Polygonatum. The dried herb of *Polygonatum officinale,* a Liliaceae; used medicinally as an astringent and antirheumatic.

solubility. The extent to which a substance (solute) mixes with a liquid (the solvent) to produce a homogeneous system (solution). The degree of solubility is the concentration of a saturated solution at a given temperature.

Solubility generally increases with an increase in temperature. **apparent-** The total amount of substance dissolved in a liquid, comprising the non-ionized and ionized portions. **molar-** The relative number of molecules dissolved; m = s/M, where m is *molar solubility*, s the number of grams per liter and M the molecular weight. **real-** The amount of non-ionized portion of a solute dissolved in a liquid.

s. curve. A graph obtained by plotting the amount of dissolved substance in a saturated solution against the temperature. **s. exponent.** p or pS. The logarithm of the reciprocal of the solubility product; thus, $p_s = \log 1/S$. Cf. *pH*. **s. product.** The product of the concentration of ions of a substance in its saturated solution: Let MX be a salt that ionises to M^+ and X^-:

$$MX \rightleftharpoons M^+ + X^-, \quad \text{then,} \quad S = \frac{[M^+] \times [X^-]}{[MX]}$$

If the product of the ion concentration, $[M^+] \times [X^-]$, is smaller than the solubility product, the solution is unsaturated and MX will not precipitate. If its exceeds the solubility product, MX will precipitate, and in order to cause this it is not necessary to add both ions, as either added M^+ or X^- will shift the equilibrium to the saturation point and cause the precipitation of MX. For example, NaCl ionises to Na^+ and Cl^-, and can be precipitated in concentrated solutions by the addition of Cl^- as HCl gas.

soluble. Capable of mixing with a liquid (dissolving) to form a homogeneous mixture (solution). The degree of solubility may conventionally be expressed:

very soluble....	less than 1 part solvent
freely soluble...	from 1 to 10 parts solvent
soluble.....	from 10 to 30 parts solvent
sparingly soluble	from 30 to 100 parts solvent
slightly soluble..	from 100 to 1000 parts solvent
very slightly soluble	from 1000 to 10,000 parts solvent
insoluble.....	more than 10,000 parts solvent

needed to dissolve 1 part substance (solute).

Cf. *solubility, solution.* **s. barbital.** Barbital sodium. **s. cotton.** Nitrocellulose. **s. glass.** Sodium silicate. **s. gluside.** Sodium benzosulfinide. **s. mercury.** $NH_2Hg_2NO_3$ = 479.6. Hahnemann's mercury. A black precipitate obtained by adding ammonia to mercurous nitrate; used medicinally. **s. starch.** See *starch*. **s. tartar.** Ammonium potassium tartrate. **s. tartrate.** Potassium tartrate.

soluend. An early term for solute.

solurol. $C_{30}H_{46}O_{16}N_4.2P_2O_5$ = 1002.5. Thyminic acid, nucleotin phosphoric acid. A yellow amorphous powder, soluble in water; used medicinally (cf. *nucleic acid*).

solute. A substance that mixes with or dissolves in a solvent to produce a solution.

solution. The mixing of a solid, liquid or gaseous substance (solute) with a liquid (the solvent), forming a homogeneous mixture from which the dissolved substance can be recovered by crystallisation or other physical processes. It is generally not accompanied by chemical change, and is thus strictly a physical phenomenon that may or may not involve ionisation. Thus, NaCl = $Na^+ + Cl^-$ occurs in *solution;* whearas, $2Na + 2H_2O = 2NaOH + H_2$ is a chemical *reaction*. **alcoholic-** A solution in which alcohol is the main solvent. **anisotonic-** Any non-isotonic solution; as, a hypotonic or hypertonic solution. **aqueous-** A solution in which water is the main solvent. **buffer-** A solution which consists of acid or basic salts that can neutralize either acids or bases without any appreciable change in hydrogen ion concentration. **centinormal-** A solution containing $\frac{1}{100}$ equivalent moles per liter. **chemical-** A s. in which solute and solvent reaction to form a compound which dissolves in the remainder of the solvent; the latter can not therefore be recovered by distillation. Cf. *physical-*. **colloidal-** A macroscopically-homogeneous, but microscopically-heterogeneous system consisting of minute particles (colloid, dispersed phase) suspended in a liquid (continuous phase, medium). Cf. *colloid*. **concentrated-** A s. in which the solute is relatively great in quantity. **decinormal-** A solution which contains $\frac{1}{10}$ equivalent moles per liter. **dilute-** A s. in which the solute is relatively small in quantity. **gram-molecular-** Molar solution. **heat of-** See *heat*. **hypertonic-** A solution which has an osmotic pressure greater than that of blood serum. **hypotonic-** A solution having an osmotic pressure less than that of blood serum. **ionic-** A s. in which the ions of the solute are surrounded by oriented molecules of the solvent. **isotonic-** A solution having an osmotic pressure equal to that of blood serum. **molal-** A s. containing a gram-molecule (mol) of substance per 1000 gm. solution. **molar-** A solution containing a gram-molecule of substance per liter. It may differ from normal solution. **molecular-** A true s. in which the molecules of solute are surrounded by the molecules of solvent; Cf. *colloidal-, ionic-*. **normal-** A solution containing one equivalent gram-molecule per liter. It may differ from molar solution. **normal salt-** A solution containing one mol NaCl per liter. It differs from physiological or standard salt solution, q.v. **physical-** A s. in which solute and solvent mix but do not react chemically; the solute can be recovered on evaporation, the solvent by distillation. Cf. *chemical-*. **physiological-** An isotonic solution; as, a solution containing 0.6–0.7 % NaCl. **saturated-** A solution that normally contains the maximum amount of substance able to be dissolved. **solid-** See *solid-solution, sosoloid*. **standard-** A solution that contains a definite amount of substance dissolved; as, a molar or normal solution. **standardized-** A solution that has been adjusted to a definite, or known concentration, and has definite chemical, physical or therapeutic effects. **supersaturated-** A solution that contains a greater quantity of solid than can normally be dissolved at a given temperature, but from which the solid has not separated. It is obtained by slowly cooling a saturated solution, and is an unstable system from which the excess readily crystallizes or precipitates. **test-** T.S. A reagent solution. **volumetric-** V.S. A standard solution, usually containing 1, $\frac{1}{2}$, or $\frac{1}{10}$ mol of a substance dissolved in one liter of water; used in volumetric analysis.

s. pressure. The tendency of atoms or molecules to mix with a liquid, or to dissolve in it. It is measured by the osmotic pressure, and represents the "adhesive" power of the molecusle of the solvent towards the molecules of the

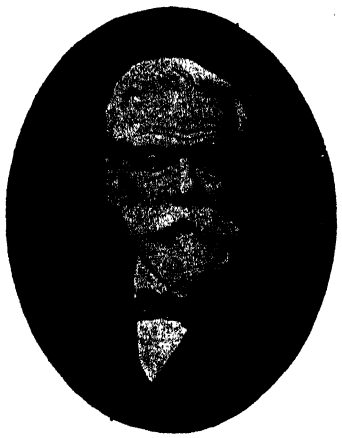
solute. A substance that is capable of forming ions produces the analogous solution tension (q.v.). **s. tension.** The tendency of atoms or molecules to ionize in a liquid, or to dissolve with ionization. It is generally measured by the electromotive force, and represents the power of atoms to hold or lose electrons. See *Nernst's theory.* **s. theory.** See *Nernst's theory, Arrhenius' theory.*

solvate. A molecular or ionic complex formed by one or more molecules or ions of the solvent with one or more molecules or ions of the solute; as, the hydrates $Na(H_2O)_x^+$ and $Cl(H_2O)_x^-$, where the ions are surrounded by a zone of oriented water molecules. **crystalline-** A crystal containing solvent as part of its lattice; as, water, alcohol, chloroform, benzene, acetic acid. **s. theory.** The abnormalities of solutions are due to the formation of addition compounds or complexes between the ions or molecules of the dissolved substance, and of the solvent. Cf. *zone, hydration, aquation.*

solvation. A combination between solute and solvent; if the latter is water, hydrates or hydrated ions are formed, *e.g.*, $M(H_2O)x$.

solvatochromism. The formation, by molecular addition, of a colored complex (solvate) between colorless molecules of organic compounds and those of other inorganic or organic compounds.

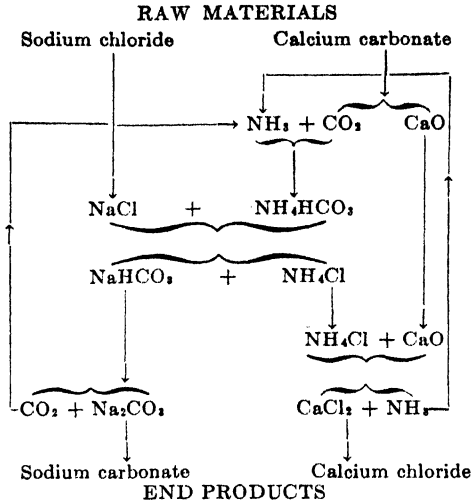
solvatone. A mixture of 80 % acetone, 10 % toluene and 10 % *i*-propylalcohol; used as a lacquer solvent.



Ernst Solvay.

(From Brownlee, Fuller and Hancock "Elementary Chemistry." Courtesy of Allyn & Bacon.)

Solvay, Ernst. 1838–1922. A Belgian chemist and industrialist, noted for his development of soda-manufacture. **S. process.** Ammonium soda process. A method of making sodium carbonate by treating sodium chloride with ammonia and carbon dioxide. The sodium bicarbonate produced is heated and some carbon dioxide recovered, while the ammonia is recovered by lime or magnesia. With sodium chloride and the resulting calcium carbonate as raw materials and with a certain quantity of ammonia as circulating medium, the net output is sodium carbonate and calcium chloride, according to the following flow-sheet:



solvent. (1) That component of a homogeneous mixture which is in excess. (2) A liquid which dissolves another substance (solute), generally a solid, without any change in chemical composition; as, sugar or salt in water. (3) A liquid which reacts chemically with a solid and brings it into solution; as, acids which dissolve metals. See tables. **acid-** One which acts as an acid by losing a proton to the solute. **associating-** A s. whose molecules form complexes; as, water, liquid ammonia. Cf. *bond, association.* **aqueous-** Water. **basic-** One which acts as a base by gaining a proton from the solute. **chemical-** A substance which reacts with another to form a solution; as carbonates or sulfides which dissolve in acids. **hydrocarbon-** Gasoline, benzene, kerosene, etc. **ionizing-** See *polar-*. **lacquer-** Those organic liquids which are used to dissolve resins and nitrocellulose. They are classified as: *low boiling*—b. below 100 (acetone, alcohol, benzene); *medium boiling*—b. near 125 (toluene, butyl acetate, amyl acetate); *high boiling*—b. 150–200 (xylene, ethyl acetate, benzyl alcohol); and as *plasticizers* and *softeners*—b. near 300 (camphor, phthalates, phenyl phosphates). **molten-** Flux. **nonassociating-** A s. which does not form complexes between its molecules or ions and the solute; as, benzene. **nonaqueous-** A solvent other than water. **nonionizing-** Nonpolar. **nonpolar-** A solvent which does not conduct an electric current; as hydrocarbons, chloroform, carbon disulfide, etc. **normal-** Nonassociating-. **physical-** A s. which does not react chemically with the solute. **polar-** A s. which produces electrically-conducting solutions, (as, water, liquid ammonia, sulfur dioxide, hydrocyanic acid, hydrofluoric acid, organic acids and alcohol) and causes dissociation of the solute into ions. **universal-** Aqua regia.

s. action. Any process of making substances water-soluble; as insoluble phosphates transformed by soil bacteria to the soluble phosphoric acid.

ONE-TYPE SOLVENTS

(*a*) Alcohols, R.OH.
methanol, wood alcohol
ethanol, grain alcohol
propanol, propyl alcohol

butanol, butyl alcohol
glycol, ethane-1.2-diol
propan-1.3-diol
glycerol, glycerine
(*b*) Ethers, R.O.R.
dimethylether
ethylmethylether
ethylether, ether
propylmethylether
methylal, dimethoxymethane
glycoldimethylether
(*c*) Ketones, R.CO.R.
acetone, dimethylketone
ethylmethylketone, 2-butanone
diethylketone, 3-pentanone
propylmethylketone, 2-pentanone
acetylacetone, 2.4-pentandione
acetonylacetone, 2.5-hexandione
(*d*) Esters, R.COO.R.
methylacetate
methylpropionate
methylbutyrate
ethylacetate
propylacetate
ethyleneacetate, glycoldiacetate

TWO-TYPE SOLVENTS

(*ab*) Alcohol-ethers, HO.R.O.R.
cellosolve, methoxyethanol
ethoxyethanol
diethoxyglycerol
(*ac*) Alcohol-ketones, HO.R.CO.R.
acetol, acetylcarbinol
acetylpropyl alcohol
diacetone alcohol
(*ad*) Alcohol-esters, HO.R.COO.R.
methylglycolate
ethylglycolate
cellosolve acetate
(*bc*) Ether-ketones, R.O.R.CO.R.
methoxyacetone
ethoxyacetone
diethoxyacetone
(*bd*) Ether-esters, R.O.R.COO.R.
methylmethoxy acetate
methylethoxy acetate
ethylethoxy lactate
(*cd*) Ketone-esters, R.CO.R.COO.R.
methyl pyruvate
ethyl pyruvate
methylketo butyrate

solvolysis. The effect of the acid or basic character of a solvent on the ionization of a salt dissolved in it.

solvolytic. Pertaining to solvation. **s. dissociation.** Ionization in a non-aqueous solution; as, liquid ammonia. Cf. *solvate* theory.

sombrerite. A "hard" mineral phosphate (35 % P_2O_5); a source of phosphorus.

Sommerfeld, Arnold. A German physicist, noted for his development of the quantum theory of atomic structure. **S. notation.** See *quantum numbers*.

somnal. $C_7H_{12}NO_3Cl_3$ = 264.49. An ethyl derivative of chloral urethane. A clear colorless liquid, used medicinally as a hypnotic and diuretic.

somnifacient. A hypnotic, or agent that causes sleep.

somnifene. Allonal.

somnirol. $C_{32}H_{44}O_7$ = 540.34. A monohydric alcohol of *Withania* species, Solanaceae.

somnitol. $C_{33}H_{46}O_7$ = 554.43. A dihydric alcohol from *Withania* species, Solanaceae.

somnol. $C_9H_{11}O_6Cl_3$ = 518.2. Somnos. Chlorethanal alcoholate. Colorless crystals, used medicinally as a hypnotic.

somnos. Somnol.

soneryl. Neonal.

sonic. Phonic. Cf. *sound*.

Sonnenschein, Franz Leopold. 1819–1879. A German pharmacist noted for analytical and forensic methods. **S.'s reagent.** A solution of phosphomolybdic acid. It forms a yellow precipitate with the sulfates of alkaloids.

sonometer. Phonometer. An instrument for measuring sound vibrations.

sonora gum. The exudations of the creosote bush, *Covillea tridentata*, a native of the South Western States and Mexico.

soot. An impure black carbon containing oily and empyreumatic compounds produced during the incomplete combustion of resinous materials or wood. It contains hydrocarbons, and if derived from coal, it has a fertilizing value on account of the presence of ammonium sulfate. Cf. *lamp-black*.

sophol. A compound of silver and methylene-nucleinic acid; a yellowish powder, used medicinally.

sophora. Coral bean. The poisonous seeds of *Sophora* species, a Leguminosae of India. **S. tomentosa.** A leguminous shrub or tree of the Dutch East Indies and Japan. A famous remedy for cholera and diarrhea; it contains an alkaloid, sophorine.

sophorin. $C_{27}H_{30}O_{16}$ = 610.23. A glucoside from *Sophora* species. Cf. *cyanin*.

sophorine. An alkaloid from *Sophora* species. A colorless liquid resembling cytisine and matrine. Cf. *kuhseng*.

soporific. An agent that produces deep sleep; a hypnotic.

sorbic acid. $C_6H_8O_2$ = 112.1. Hexadienic acid, pentadiene carboxylic acid, *2.4*-hexadienoic acid*. A monobasic acid, Me.CH:CH.CH:CH.COOH, derived from the unripe berries of mountain ash (*Sorbus*). Colorless needles, m.134, b.228 (decomp.), slightly soluble in water, soluble in alcohol or ether. **hydro-** Hexenic acid*. **methylenedioxyphenyl-** Piperic acid. **para-** A lactone-like body that changes when heated with H^+ or OH^- to sorbic acid.

sorbin. Sorbinose.

sorbinose. $C_6H_{12}O_6$ = 180.1. Sorbin, *1.3.4.5.6*-pentahydroxy-*2*-hexanone*, sorbose. An optically-active carbohydrate derived from the fruits of mountain ash (*Sorbus*). Colorless rhombic crystals, d.1.654, m.154; slightly soluble in water, alcohol or ether.

sorbite. (1) Sorbitol. (2) A constituent of steel; considered to be a mixture of ferrite and cementite. It is a transition-form between pearlite and troostite.

sorbitol. $C_6H_{14}O_6.\frac{1}{2}H_2O$ = 191.1. Sorbite, *1.2.-3.4.5.6*-hexanehexol*. An alcohol isomer of mannitol from *Sorbus aucuparia*. Colorless crystals, m.111, soluble in water or alcohol.

sorbol. $C_{34}H_{70}O$ = 494.5. An alcohol, m.78, from the wax of the berries of *Sorbus aucuparia*.

sorbose. Sorbinose.

sorbus. Rowan tree, mountain ash. The tree *Pyrus* (*Sorbus* or *Mespilus*) *aucuparia*, a Rosaceae. Its ripe berries furnish an acidulous and astringent gargle; its unripe berries yield sorbic acid. A decoction of the bark is used for diarrhea, and contains sorbitol and sorbinose.

Sorel, cement. $MgO.MgCl_2.11H_2O$. A hard, quick-setting mixture of MgO and a conc. solution of $MgCl_2$. **S. dental cement.** A mixture of ZnO, $ZnCl_2$ and fine sand. **S. floor cement.** A mixture of MgO, $MgCl_2$ and Portland cement, used for hard, smooth, dustless floors in office buildings. The addition of 10 % finely-powdered copper makes it waterproof.

Sörensen, S. P. L. 1868–1939. A Danish chemist noted for the preparation of pure salts, aminoacids and enzymes. **S. indicators.** A group of indicators, used to determine the hydrogen-ion concentration. See *indicators*. **S. phosphate.** Dibasic sodium phosphate. **S. symbols.** See P_H. **S. value.** Hydrogen-ion concentration.

Soret's effect, S.'s principle. Ludwig phenomenon. When differences of temperature are maintained in a salt-solution, the dissolved material will concentrate in the coolest portions of the liquid.

sorghum. A cane-like grass, *Andropogon sorghum*, from which a sugar and syrup is obtained.

soricin. A registered trade-mark for certain preparations containing purified sodium ricinoleate which are employed as sclerosing agents and detoxicants as well as to prevent absorption of toxins.

sorption. A reaction occurring on a surface; such as, hydrolysis, electrification and especially *absorption* (q.v.) or solution, *adsorption* (q.v.) (strictly confined to a surface, as between liquid and solid), *persorption* (permeation into a very porous solid). Cf. *monomolecular film, orientation, desorption.* **ab-** See *absorption.* **ad-** See *adsorption.* **re-** See *resorption.* Cf. *zone.*

sorrel. The leaves of *Rumex acetosa*, a Polygonaceae, used as refrigerant and diuretic. **s. salt.** Potassium bioxalate.

sosoloid. Solid solution. A dispersed system consisting of a solid phase dispersed in another solid phase. See *colloidal systems.*

Soubeiran, Eugène. 1797–1858. A French apothecary, noted as discoverer of chloroform and as a writer.

sound. (1) Those air-oscillations or vibrations which affect the ear and are rendered audible. Cf. *musical notes.* (2) The vibrations in air or other medium which may or may not be audible; as, *infraphonic* (longer frequency than audible s.); *phonic* (audible); *ultraphonic* (shorter frequency than audible s.). (3) Free from defect; as s. steel, which is free from blowholes. **s. intensity.** The actual energy content of s. waves as measured by electrical instruments. **s. loudness.** The magnitude of s. as measured by the human ear; it is related to intensity as follows:

Loudness	*Intensity*
10 decibels =	10
20 decibels =	100
30 decibels =	1,000
40 decibels =	10,000
50 decibels =	100,000
60 decibels =	1,000,000
70 decibels =	10,000,000

Cf. *phon, loudness.* **s. velocity.** The speed with which s. vibrations travel in materials:

in air	331.9 m. per sec.
in water	1460 m. per sec.
in wood	4200 m. per sec.
in iron	5000 m. per sec.

s. waves. Phonic waves. Mechanical radiations consisting of air vibrations. Cf. *sound* (2), *noise, decibel.* The *highest audible* s. has a wave-length of 17 mm.; the *lowest audible* s. 16 m.

sourwood. The leaves of *Oxydendrum arboreum*, a small tree of North America; used medicinally as the fluid extract.

southern wood. *Abrotanum.*

sovprene. A polymerized chloroprene, q.v.

Soxhlet, Franz. 1848–1913. A German chemist, noted for his methods of food analysis. **S. apparatus.** A flask and condenser for the continuous extraction of fats or other alcohol-soluble or ether-soluble materials (see illustration).

Soxhlet apparatus.

soy. S. bean. **s. bean.** Soja, soya. The bean of *Soja hispida*, a Leguminosae of China. It is an important native food and the source of many preparations; as, flour, sizing materials, bean cake, sauce, cheese, etc. It contains protein, starch, alkaloids and urease. **s. bean oil.** A colorless oily liquid expressed from s. $D._{15}°0.925$, free fatty acids (as oleic acid) 0.46 %, sapon. val. 191.1, iodine val. 129.2; used in cooking.

soya. Soy bean.

sozal. $Al_2[C_6H_4(OH)SO_3]_6 = 1093.4$. Aluminum-p-phenolsulfonate, aluminum sulfocarbolate. A brown crystalline powder, soluble in water or alcohol; used medicinally as an iodoform substitute and antiseptic.

sozalbumin. A non-toxic defensive protein. Antonym, toxalbumin.

sozins. Defensive proteins which occur normally in the body. Antonym, toxosozins.

soziodol. Sozoiodol.

sozoiodol. $C_6H_4O_4I_2S = 425.94$. Sozoiodolic acid, soziodol, diiodo-p-phenolsulfonic acid, $C_6H_2I_2OH.SO_3H$. A white lustrous, crystalline powder, decomp. 200, soluble in water. Used medicinally as an antiseptic and iodoform substitute.

sozoiodolate. A salt of sozoiodol. Those of Pb, Hg, K, Na, and Zn are used medicinally as antiseptics.

sozoiodolic acid. Sozoiodol.

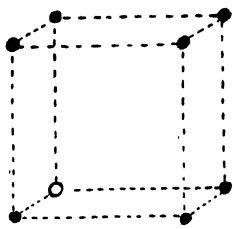
sozolic acid. Aseptol.

Sp. An abbreviation for spirit.

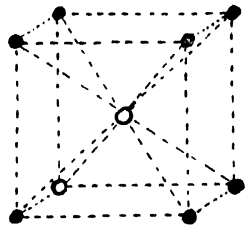
Sp. Gr. An abbreviation for specific gravity.

space. The three-dimensional concept of length, width, and height: L^3, where L is any unit of length. **Crookes'-.** Dark s. **dark-** A non-luminous region near the cathode of a vacuum tube, through which a high-frequency current is passing. **interatomic-** The region between the outermost orbits of two atoms. **intra-atomic-** The area within the outermost orbit of an electron and the nucleus of an atom. It consists of the kernel (q.v.) and the orbits of the valence electrons.

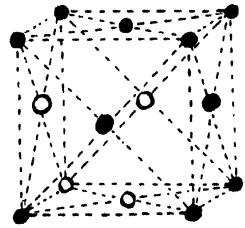
s. group. One of the characteristic space lattices or arrangements of atoms in a crystal. **s. lattice.** The pattern formed by the spatial distribution of atoms or radicals in a crystal, q.v. See figure.



Cubic



Body-centered



Face-centered

Space lattice.

spalling. (1) The failure of a refractory material to withstand stresses induced by temperature fluctuations without rupture. (2) Of metals: The cracking or flaking off of particles from a surface (*e.g.*, wheels and rails). (3) In general: The splintering, cracking or breaking up of materials due to heat (*e.g.*, ceramics).

span. A unit of length in the English system. It equals 9 inches, half a cubit, or 22.86005 cm.

Spanish broom. Spartium. **S. flies.** Cantharides. **S. hops.** Origanum. **S. moss.** Vegetable *horsehair*.

spans. Trade name of a group of sorbitan esters having emulsifying properties.

spar. Any transparent or translucent, readily cleavable, crystalline mineral having a vitreous luster; as, calcspar, feldspar, fluorspar, heavy spar.

sparassol. $C_{10}H_{12}O_4$ = 196.09. Methyl evernate, $C_6H_2(COOMe)Me(OMe)OH$, *-1.2.4.6.* An ester and ether from the oil of *Sparassis ramona*, a lichen. Colorless powder, m.68. Cf. *lichenol.*

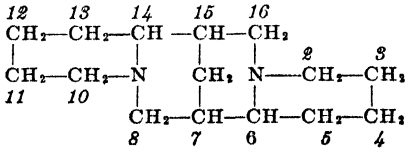
spark. A flash of light produced chemically or physically; as, on burning iron wire in oxygen, or passing an electric discharge through air. It differs from an arc since it depends on the ionization of the medium through which it passes. **s. spectrum.** An emission spectrum characteristic of the electrode metal, obtained by refracting the flashes passing between metallic electrodes carrying a high-tension discharge. It is used in analysis and is characterized by the enhanced lines due to ionized atoms. It differs from the arc spectrum (produced by neutral atoms), and resembles in general the arc spectrum of the element of next smallest atomic number. Cf. *isostere.*

sparking. Producing electric sparks. Cf. *arcing.* **s. potential.** The electric potential necessary to produce a spark in vapor or gas at ordinary temperature. It depends on the distance apart, shape, and size of the electrodes.

sparklet. A powder (similar to baking powder) for the generation of small quantities of carbon dioxide in the laboratory.

spartalite. Native zinc oxide.

sparteine. $C_{15}H_{26}N_2$ = 234.2. Lupinidine. An alkaloid obtained from *Spartium scoparium* or broom. Cf. *scoparius.*



A colorless oily liquid, d.1.02, b.328, soluble in water, alcohol, ether, or chloroform. Used medicinally as a heart stimulant. Cf. *cytisine, anagyrine.* **s. bisulfate.** Sparteine sulfate. **s. hydriodide.** $C_{15}H_{26}N_2(HI)_2$ = 490.09. Colorless needles; soluble in water or alcohol. **s. hydrochloride.** $C_{15}H_{26}N_2(HCl)_2$ = 307.17. Colorless crystals; soluble in water or alcohol. **s. sulfate.** $C_{15}H_{26}N_2.H_2SO_4.5H_2O$ = 422.40. Sparteine bisulfate. Colorless, deliquescent crystals, m.136, soluble in water, alcohol or ether; used medicinally as a cardiac tonic and diuretic.

spartium. (1) Scoparius. (2) The fiber from *S. junceum*, Spanish broom, a Leguminosae. Cf. *esparto.* **s. alkaloids.** A group of alkaloids derived from scoparius:

sparteine	$C_{15}H_{26}N_2$
spartyrine	$C_{15}H_{24}N_2$
oxysparteine	$C_{15}H_{24}ON_2$
dioxysparteine	$C_{15}H_{24}O_2N_2$
trioxysparteine	$C_{15}H_{24}O_3N_2$

spasmotin. $C_{20}H_{21}O_9$ = 405.2. Sphacelotoxin. A poisonous principle from ergot. A yellow amorphous powder, soluble in alcohol or ether.

spathic. Describing a lamellar or foliated structure. **s. iron ore.** Siderite.

spatial. Pertaining to space.

spatula. A blunt knife used for mixing semi-solid masses, or to transfer small quantities of powders in weighing.

spearmint. Mentha viridis. The dried leaves of *Mentha spicata*, a Labiatae. Used as the fluid extract, as a carminative and flavoring agent. **s. oil.** Oleum menthae viridis. The volatile oil distilled from the fresh overground portions of the flowering plant *Mentha spicata.* Colorless oil, d.0.917–0.934, soluble in alcohol; it contains carvone, linalol, pinene, etc.

spear pyrites. Marcasite.

species. (1) A subdivision of a genus of plants or animals. (2) The Latin term for a tea. (3) A type; as, atomic s. **aromatic-** A mixture of thyme, peppermint, lavender and cloves. **laxative-** St. Germain tea. A mixture of senna, elder flowers, fennel, anise, and potassium bitartrate. **pectoral-** Breast tea. A mixture of althaea, coltsfoot, licorice, anise, mullein and orris.

specific. Pertaining to a single kind of matter, microorganism, plant, animal; or to any particular thing. **s. charge.** The ratio e/m_0 = 1.760×10^7 e.m.u./g. = 5.276×10^{17} e.s.u./g. **s. conductivity.** See *conductivity.* **s. conductance.** L. The reciprocal of the resistance, R, of a centimeter cube of a substance; L = 1/R. **s. energy.** See *energy.* **s. gravity.** The ratio of the density of a substance to the density of another substance chosen as standard; *i.e.*,

$$\text{Sp. Gr.} = \frac{\text{weight of substance}}{\text{weight of equal volume of standard}},$$

(weighed under the same conditions). In the case of solids and liquids the standard is usually water, and in metric units it is equal to the density (grams per cubic centimeter). In the case of gases the standards are oxygen, hydrogen or air, and they can be calculated from the molecular weight for ideal gases (see *equation of state*):

$D_{(O_2=1)}$ = Molecular weight = M
$D_{(H_2=1)}$ = Molecular weight divided by 2
$D_{(air=1)}$ = Molecular weight divided by 28.95

See *hydrometers*. **s. heat.** The number of calories required to raise the temperature of one gram of material by one degree centigrade. **s. inductive capacity.** Di-electric constant. **s. magnetization.** The susceptibility to a magnetic field, $\chi = I/Hd$; I is the quantity of magnetization, H the intensity of the magnetic field, d the density of the material. **s. reaction rate.** The constant, k, or rate of reaction at unit concentration (1 mol per liter). **s. refraction.** Refractivity. The degree of deviation of light caused by an element or compound. It is the ratio (1) $\frac{n-1}{d}$; or (2) $\frac{n^2-1}{n^2-2}\cdot\frac{1}{d}$; n is the refractive index, and d the density of the substance. **s. resistance.** Resistivity. The number of ohms of resistance offered at a particular temperature by one cubic centimeter of material. Conductivity (q.v.) is the reciprocal of resistance. S.r. is expressed by the factor of proportion, $\rho = Ra/l$, where R is the resistance in ohms, a the area of a cross section and l the length of the body; ρ is expressed in ohm-cm.; 1 ohm-cm. = 0.3937 ohm-inch. **s. rotation.** The angle of rotation, α, produced by one cubic centimeter of material at standard temperature with sodium light: $[\alpha]^t_D = \frac{rv}{nl}$ where $[\alpha]^t_D$ is the s. rotation at t°C. for the sodium line D; r, the observed rotation in angular degrees, v the number of cc.; n the number of grams dissolved; and l, the length of the tube in cm. See *polariscope*, *rotation*. **s. rotatory power.** The rotation (in angular degrees) produced by a solution containing one gram of substance for each cc. of liquid and examined in a column 10 cm. long, usually with the yellow sodium flame (D-line of spectrum) and at room temperature (20°C.); hence $[\alpha] = \frac{100a}{lc}$, where $[\alpha]$ is the s.r., a the observed angle, l the length of the column in decimeters, and c the concentration (g. per 100 cc.). **s. surface.** The ratio of the area A, per unit volume, V, of a colloidal system: sp. s. = A/V. **s. volume.** The volume occupied by one gram of material. It is the reciprocal of density. sp. vol. = 1/d. **s. weight.** Specific gravity.

specifics. A small group of remedies that are exceptionally definite and uniform in their action towards certain diseases; as, quinine for malaria or mercury for syphilis, germanin for sleeping sickness, magnesium sulfate for tetanus, emetine for amebic dysentery, amyl nitrite for angina pectoris.

specpure. Spectroscopically pure; *e.g.*, applied to a substance giving a pure spectrum, characteristic of itself only.

spectra. Plural of spectrum, q.v. Classification:

A. The SOURCE of the light—

solar s.	flame s.	vacuum spark s.
stellar s.	flash s.	vacuum flash s.
arc s.	explosion s.	x-ray s.
spark s.	vacuum arc s.	

B. The KIND of spectrum produced—

emission s. or absorption s. { continuous s. (*a hot solid body*); discontinuous s. { line s. (*atoms*); band s. (*molecules*) }

C. The MODE of production—

prism-refracted s.	grating diffracted s.
grating-refracted s. primary, secondary, etc.	primary, secondary, etc.
	crystal diffracted s.

spectral. Pertaining to a spectrum. **s. analysis.** See *spectrum analysis*. **s. classification.** S. types. Harvard Star classification. A systematic arrangement of the stellar spectra in a continuous sequence of types, which ranges from bright line spectra to diffused band spectra. Of all the stars examined 99 % fall into the classes B, A, F, G, K, M, and N, which are characterized by the following predominant lines:
B—hydrogen and helium lines
A—hydrogen lines
F—hydrogen lines and faint metallic lines
G—many metallic lines, but no compounds
K—strong metallic lines, very weak bands
M—banded spectra of metallic oxides
This, however, does not indicate completely the chemical nature, but rather the physical conditions of a celestial object. Cf. *transuranium*, *hypon*. The stars of each class show many similarities of temperature, brightness and size, which lead to conclusions as to their equality of mass and internal conditions. See table of star s. classes. **s. tube.** An evacuated glass tube with two electrodes. By filling the glass tube with a gas before evacuation, the remaining,

Spectral tube.

rarefied traces of gas produce light with a characteristic spectrum when an electric current is passed through. **s. types.** (1) S. classification. (2) See spectra.

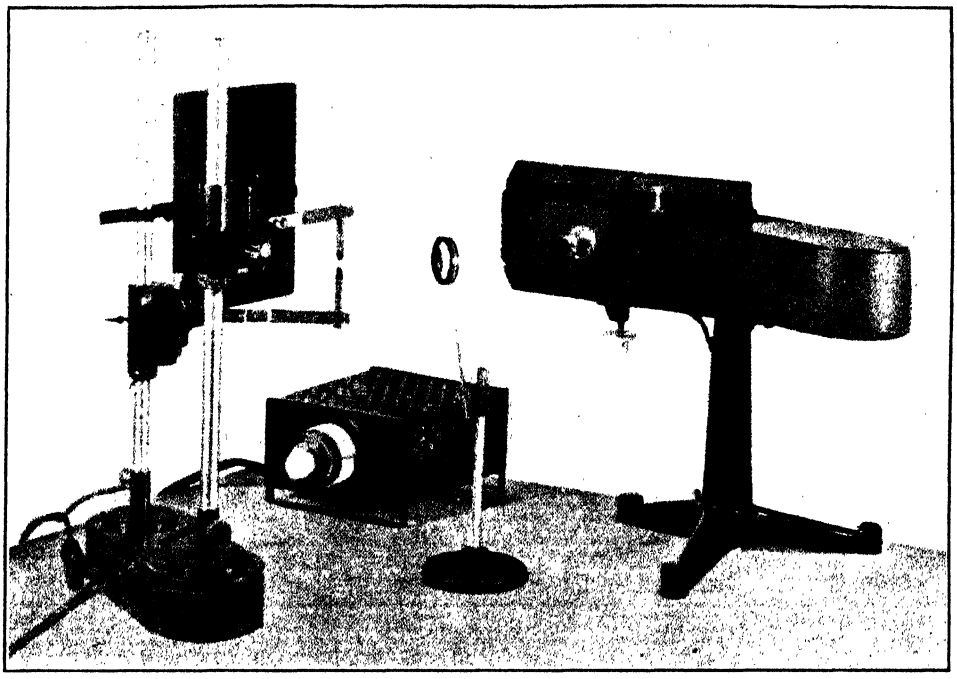
spectrochemical analysis. Spectroscopic analysis.

spectrochemistry. A branch of science that utilizes light waves as a means of chemical analysis (see *spectrum analysis*).

spectrogram. The photographic plate, film or print on which a spectrum is recorded, together with a standard comparison spectrum.

spectrograph. An instrument to produce a spectrogram, consisting of (1) the slit, (2) the lenses (collimeter or camera lens), (3) the dispersing system (prisms or gratings), (4) the recording system (photographic, thermal or ionic). See illustration. **quartz-** A s. used for wave-lengths of 8000–2000 A.U. **x-ray-** A device for obtaining crystallograms.

spectroheliograph. A device for photographing the sun's surface by means of a spectroscope employing a specific line of the spectrum; the slit of a camera is focused on the desired portion



Spectrograph.

1. Arc and spark stand: 2. Rheostat: 3. Condensing lens; 4. Littrow spectrograph. (*Bausch and Lomb.*)

of the solar spectrum, and a picture of the distribution of certain element vapors is obtained.

spectrometer. A spectroscope with scales for measuring the angle of refraction and the wavelengths of lines or bands. **constant deviation-** A s. in which the collimator and telescope are fixed permanently at right angles, and the prism is rotated.

spectrometry. The measurement of the wavelengths of the lines or bands in a spectrum and their identification with the elements which produce them.

spectrophotometer. (1) A device for measuring photometrically the quantity of light of any particular wave-length range absorbed by a colored solution. (2) A device for measuring the intensity of the photographic image of a spectral line.

spectroscope. (1) An instrument for analyzing light by separating it into its component rays. It consists essentially either of a prism that refracts the light, or a grating by which the light is diffracted, together with a device for making the rays parallel (collimator) and an eyepiece for enlarging the spectrum (view telescope). (2) A device by which radiations are separated into component parts; as, mass s., x-ray s. S. are classified in terms of:

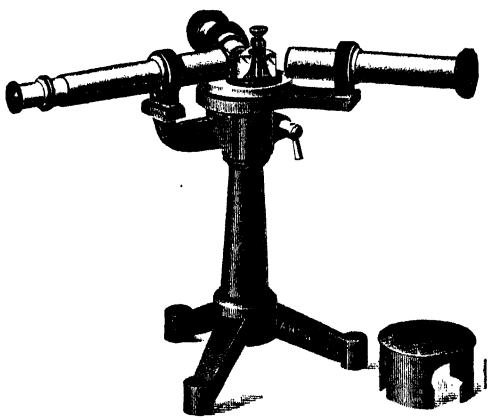
(1) Slit:
- present ..... general work
- absent ..... astronomical work

(2) Lens system (collimator):
- quartz ..... for ultra-violet
- crown glass ..... for low dispersion
- flint glass ..... for high dispersion
- fluorite, sylvine and rock salt ..... for infra-red

(3) Dispersing system:
- prisms (made of material as under 2)
- plane grating
- concave grating

(4) Observing and recording system:
- eyepiece ..... visual (spectroscope)
- photographic plate ..... spectrograph
- thermopile, photoelectric cell ..... energy measurements

abridged- An absorptiometer (q.v.) used with a series of restricted spectral ranges. **comparison-** A s. for comparing two spectra, side by side. **direct vision-** A s. of low-dispersive power in which the collimator, train of prisms and eyepiece are along the axis of a single tube.



Prism spectroscope.

SPECTRAL CLASSIFICATION OF STARS

Showing the relations of spectral class (a), temperature (b), luminosity (c, d, and e), radius (f), mass (g) and density (h)

F	7500	van Maanen's star	12.6	14.5	.....	0.007	(0.14)	400000

(a) *Spectral Class* (d—dwarfs, g—giants, c—super-giants).
(b) *Surface Temperature*, decreases gradually from 21,000°C. in class B to 3000°C. in class M.
(c) *Apparent* or *Visual Magnitude* as seen from the earth. Brightest stars are Sirius, Canopus, α Centauri, Vega, Arcturus. (A standard candle at 1 m. distance has −14.2, at 1 km. distance 0.8.)
(d) *Absolute Magnitude*, corrected for distance: −7.4 (Canopus) the brightest, and 14.5 (van Maanen's star) the faintest star on this list.
(e) *Luminosity*, the reciprocal of absolute magnitude. Compared to the Sun = 1, it ranges in giants from 80,000 to 10, in the main sequence from B = 3100 to M = 0.001.
(f) *Radius* as compared to Sun = 1, ranges in giants from 480 to 12, in main sequence from 11 to 0.1, and in the white dwarfs from 0.03 to 0.007.
(g) *Mass*, remains for all stars within the narrow range of $\frac{1}{10}$ to 30 times the mass of the sun.
(h) *Density*, in giants from 0.000,000,3 to 0.002,4 (highly-rarified gases); in main sequence from B = 0.01 to M = 9.0; and in dwarfs from 50 to 400,000 times the density of water (closely-packed atoms stripped of electrons).

(Adapted from Russel, Dugan and Stewart, "Astrophysics," Ginn and Co., 1927.)

It is used in analytical work. **grating-** A s. of high dispersive power in which a series of spectra is formed by either: (a) a reflection grating, a finely-ruled piece of plane or concave (self-focusing) speculum metal; or (b) a transmission grating, which is a celluloid cast of the original grating. **mass-** A device for separating canal rays or positively-charged corpuscles by subjecting them to electric and magnetic fields. Cf. *isotopes, mass spectra.* **measuring-** A s. adapted to the measurement of the wave-lengths of the component rays; a *spectrometer.* **micro-** See *microspectroscope.* **photographic-** A s. in which the viewing telescope is replaced by a camera; a *spectrograph.* **prism-** A s. of low or high dispersive power containing a single prism or a train of prisms, either of glass, quartz, rock salt or other transparent material. **reversion-** A s. which enables the same spectrum to be reproduced twice, but in reverse directions, thus doubling any displacement of absorption bands; used for the determination of CO in blood. **x-ray.** See *x-ray spectrometer.*

spectroscopic. Associated with the spectroscope. **s. analysis.** Spectrum analysis, spectrochemical analysis. The qualitative and quantitative

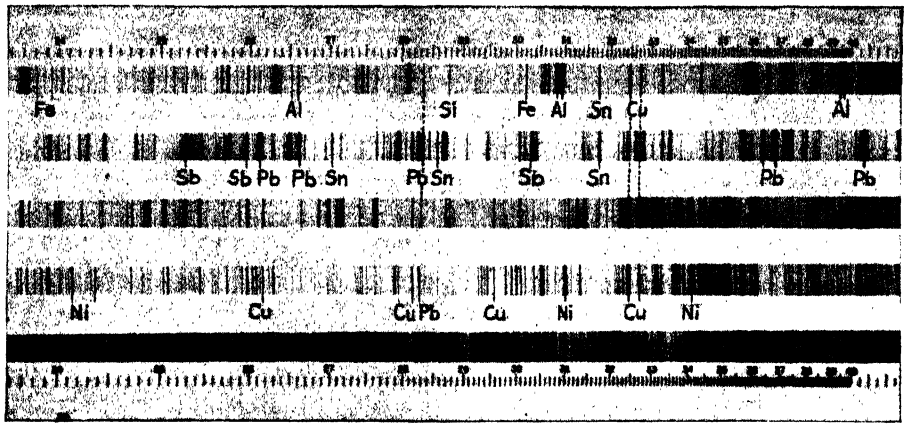
analysis of substances by means of the spectroscope. Minute quantities of elements may be detected by their characteristic lines in the spectrum. The principal methods are:

1. Examination of a flame (bunsen burner) colored with a small quantity of the substance:
   sodium, yellow line 589
   potassium, red lines 766, 769, purple line 404
   lithium, red line 671
   cesium, blue lines 455, 459
   rubidium, purple lines, 420, 421
   calcium, orange band 620–618
   strontium, red bands, 686–674–662 and 606
   barium, green line 553, bands 534–524, etc.
   radium, red band 670–653
   thallium, green line 535
   indium, blue line, 451, purple line 410
   copper, green and blue lines and bands
2. Examination of an electric spark passing through a small cup containing a solution of the substance; for: magnesium, iron, manganese, zinc, cobalt, nickel, chromium.
3. Examination of the spectrum when the light has previously passed through a solution of the substance (absorption spectrum). This method is used extensively in the investigation of organic substances, including blood and coloring materials.

spectroscopically. Pertaining to spectroscopy. **s. pure.** Specpure. The degree of purity of a substance which enables it to be identified spectroscopically, the essential lines being apparent without interference from those due to the impurities present.

spectroscopy. That branch of science which investigates the properties of light by means of the spectroscope.

spectrum. (1) A variously-colored band of light showing in succession the rainbow colors or isolated lines or bands of colors; produced by refraction through a prism, or by diffraction by a grating. It may be of the emission type (flame, arc, spark), or the absorption type. Cf. *spectra.* (2) A similar band of radiant energy, invisible to the eye and extending beyond the violet (ultra-violet) or red (infra-red) portions of the visible spectrum. See *radiations.* **absorption-** The visible or invisible **s.** produced by a composite ray of light after it has passed through a colored solution or through a layer of vapor or gas, which absorbs one or more constituent ray. **arc-** A s. produced with an electric arc as source of light. The element or compound is placed between the carbon poles of an arc. **Aston-** See *mass-.* **band-** A s. consisting of a series of lines so close together that they appear as a continuous band. They are due to *molecular* vibrations. Cf. *line s.* **bright line-** See *line-, flash-.* **chemic-** That portion of the s. which contains the most chemically-active wave-lengths, as actinic or ultra-violet rays. **comparison-** A s. which contains a number of sharp lines, whose wave-lengths serve as standard; it is usually photographed on the same plate above and below the spectrum to be examined or measured. The arc or spark spectrum of titanium or iron is often used. **continuous-** A s. in which no Fraunhofer lines are visible; that is, in which there is an uninterrupted change from one color to another. **dark line-** Reversal s. A s. which contains Fraunhofer lines, or some portions less bright than others, cf. *absorption-.* **diffraction-** A s. produced by means of a grating. **discontinuous-** A combined line and band s. **electrochemical-** See *electrochemical-.* **electromagnetic-** See *radiations.* **emission-** A s. which consists of a series of bright lines produced from an incandescent source. **explosion-** A s. produced by exploding a metallic wire or a solution on an asbestos fiber by means of an electric current. It shows lines from excitation states above the spark s. **flame-** A s. produced with a bunsen flame as the source of excitation. **flash-** (1) Explosion-. (2) A s. showing bright Fraunhofer lines on a dark background; it is seen during a solar eclipse and originates in the hot gases surrounding the sun, which ordinarily absorb and give rise to the dark Fraunhofer lines. **furnace-** A s. obtained with an electric furnace (3000°C.) as source of excitation. It is intermediate between the flame and arc s. **high frequency-** An x-ray s. produced by high-frequency currents. **hyperfine-** A s. consisting of extremely thin lines close together, and due to nuclear vibrations. Cf. *band s.* **infrared-** The dark region beyond the red end of the s.; it consists chiefly of thermal rays. **line-** A s. that shows colored or bright lines on a dark back-ground; due to atomic vibrations. Cf. *hyperfine s.* **invisible-** See *ultra-violet s., infra-red s.* **magnetic-** See *magnetic s.* **mass-** Aston-. The series of images produced on the photographic plate when canal rays are subjected to electric and magnetic fields, which separate the ions according to their mass. Cf. *isotopic weight.* **molecular-** See *band s., molecular ray.* **Moseley-** See *x-ray spectrum.* **nebular-** S. obtained by photographing gaseous, planetary or spiral nebulae with telescope and spectrograph. **normal-** Diffraction s. A s. produced by a grating; it shows the rays of different wave-lengths in proper relationship to one another, and is not as distorted as is the s. produced by a prism, which crowds the blue and violet lines together. **photographic-** S. that affect photographic emulsions. Cf. *ionic, thermal.* **photopic-** A s. bright enough to arouse color sensations in the human eye. Cf. *scotopic s.* **planetary-** A polarized solar s., produced by light reflected from planets. **primary-** The most prominent s. produced by a grating. **Raman-** See *scattering, Raman spectrum.* **reversal-** See *dark line-.* **Roentgen-.** X-ray-. **scotopic-** The s. seen by the dark-adapted human eye. Cf. *photopic s.* **secondary-** The second most prominent s. produced by a grating. **solar-** A s. produced by the light of the sun; it shows the characteristic Fraunhofer lines. **spark-** A s. produced by the excitation of a vapor by electric sparks. By using electrodes of different metals a characteristic spectrum with many enhanced lines for each metal is obtained. **stellar-** A s. produced by the light of stars. Cf. *spectral classification.* **sun-spot-** A s. obtained by passing the light from sun spots through a quarter-wave plate or Nicol prism; it shows the Zeeman effect, q.v. **ultra-violet-** The dark portion beyond the violet end of the s.; it consists chiefly of chemically-active rays. Cf. *irradiation.* **x-ray-** Moseley s. A series of lines characteristic of the metal used as anticathode in an x-ray tube. The



Spectra of metals and alloys.

1. Aluminum casting. 2. Babbitt metal. 3. Electrolytic copper. 4. Monel metal. 5. Iron spark

x-rays are diffracted by a crystal acting as a grating, and the rays are photographed. The frequencies are proportional to the atomic number of the element used as anticathode; they originate in the transitions of electrons from one energy level to another. Cf. *K, L, M radiations, Bohr atoms, orbit.*

s. analysis. (1) The measurement of the intensity and frequency of s. lines. (2) Spectroscopic analysis. (3) The analysis of the structure of a spectrum, *e.g.*, the resolution of it into series or multiplets. **s. classes.** See (1) *spectra*, (2) *spectral classification.* **s. lamp.** See *lamp.* **s. lines.** See *s. series.* **s. series.** A mathematical relationship existing between the lines or group of lines in the spectrum of an element.

$$\nu = \frac{1}{\lambda} = L + \frac{BN}{\left(m + \alpha + \frac{\beta}{m^2}\right)^2}$$

ν = the wave number in vacuo (waves per cm.);
L = the wave number of the limit of the series;
N = the Rydberg universal series constant, (109678.7 for H_2);
m = a variable integer corresponding with a definite line,
α, β, B = constants.

Cf. *Rydberg, Bohr's theory, orbits.* **s. types.** The appearance of a s., as in spectral classification. Laboratory s. are generally either:

A. Continuous; as, from an incandescent lamp, carbon arc or hot glowing body
B. Discontinuous:
   1. *bright line* s.; as incandescent gas, flame of sodium, arc of iron or spark spectra.
   2. *dark line* s.; as solar spectrum or continuous spectrum absorbed by a hot gaseous envelope.
   3. *bright band* s.: as comet spectrum.
   4. *dark band* s.: as, the absorption spectrum of hemoglobin or dye solutions.

specular. Mirror-like. **s. coal.** Pitch coal. A shining variety of coal. **s. hematite.** Specularite. **s. iron.** Specularite. **s. metal.** Speculum metal.

specularite. Fe_2O_3. Specular hematite, specular iron, gray hematite. A native iron oxide; disk-like crystals with bright metallic luster.

speculation. A guess or a conclusion drawn from incomplete knowledge of facts. Cf. *deduction, hypothesis.*

speculum metal. An alloy of 66 % copper and 33 % tin, with a trace of arsenic; used in making mirrors.

speise. A native arsenide; usually fusible and brittle.

speiss cobalt. $(FeNiCO)As_2$. An impure smaltite.

spelter. Commercial zinc used for galvanizing. **hard-** S. recovered from the dross from the galvanizing bath and containing 10 % iron.

Spengler's method. A method of staining a microscopical object by three successive treatments:

1. Carbolfuchsin; apply as usual.
2. Spengler No. 1—a solution of 1 part Esbach's reagent and 1 part alcohol; stain, dry and decolorize.
3. Spengler No. 2—a saturated solution of picric acid; stain and dry.

sperm. A male reproductive cell. **s. oil.** The oil of the s. whale. **s. whale.** The mammal, *Physeter macrocephalus*, a source of spermaceti and ambergris.

spermaceti. Cetaceum. The solid fat from the head of the sperm whale, *Physeter macrocephalus;* chiefly cetyl palmitate. A white unctuous mass of faint odor, d.0.94, m.45; used pharmaceutically, and for standard candles, q.v.

spermin. $C_8H_{14}N_2$ = 102.1. A leukomaine and constituent of spermatic fluid, sputum and other animal substances. Colorless crystals, soluble in water; used as a nerve tonic and stimulant.

sperrschicht cell. A photoelectric cell which is sensitive over the whole range of the visual spectrum.

sperrylite. $PtAs_2$. A native platinum arsenide.

spessartite. $3MgO.Al_2O_3.3SiO_2$. A reddish variety of aluminum garnet (q.v.) found in Germany.

sp. gr. Abbreviation for specific gravity.

sphacelic acid. An acid from ergot.

sphacelotoxin. Spasmotin.

sphaerite. A hydrous phosphate of aluminum.

sphalerite. ZnS. Pseudo-galena. Zinc blende, blende, rosinjack, jack, mock ore. An isometric native zinc sulfide. Cf. *wurtzite.*

sphene. $CaTiSiO_5$. Titanite. A native yellow or brown calcium silicotitanite, found in rocks; it has a waxy lustre.

sphenoid. A hemihedral form of a crystal or a half crystal.

sphere. A globe or ball.

spherical. Ball-shaped or globular.

spherocobaltite. $CoCO_3$. A native cobaltous carbonate.

spheroidal. Sphere-shaped.

spheroidization. The formation of rounded grains in alloys, generally during annealing.

spherometer. An instrument for determining the curvature of a surface.

spherulite. A spherical group of minute radiating crystals.

sphingoin. $C_{17}H_{35}O_2N$ = 285.3. A leukomaine in the brain.

sphingomyelin. $C_{46}H_{96}N_2O_6P$ = 1035.00. A phospholipin from brain, yielding on hydrolysis phosphoric acid, choline, sphingosine and cerebronic acid.

sphingosine. $C_{17}H_{35}O_2N$ = 285.32. An unsaturated, aliphatic amino-alcohol split-product of the cerebrosides.

sphygmograph. A device for recording the pulse.

sphygmomanometer. A device for recording heart beats.

spice. A condiment or substance used to give flavor and distinctive taste to food; the majority contain essential oils. Their ash content is an indication of their purity and the following are average standards for powdered spices:

	Average total ash %	*Maximum ash permissible (U. S. A.)*
allspice	4.5	(6 %)
anise	6.8	(9 %)
bay leaves	4.6	
basil	15.12	
calamus	4.6	
capers	2.1	
caraway	6.7	(8 %)
cardamon	6.7	(8 %)
cassia	4.3	(5 %)
cassia buds	4.7	
celery seeds	8.4	(10 %)
charlock	6.1	
cinnamon	4.0	(5 %)
cloves	6.1	(7 %)
coriander	5.4	(7 %)
cumin	7.6	(8.5 %)
dill	9.9	
fennel	8.1	(9 %)
fenugreek	3.0	
garlic	6.4	
ginger	4.9	(7 %)
juniper berries	2.7	
mace	2.3	(3 %)
marjoram	10.6	(16 %)
mustard	4.8	(5 %)
mustard flour	5.5	(6 %)
nutmeg	2.5	(5 %)
onion	4.3	
paprika	6.8	(8 %)
parsley	11.7	
pepper, black	5.0	(7 %)
pepper, red	6.3	(8 %)
pepper, white	1.3	(3.5 %)
safflower	6.7	
saffron	5.4	
sage	7.4	(10 %)
savory	9.9	
star anise	2.6	
tarragon	10.4	
thyme	9.8	(14 %)
turmeric	6.4	
vanilla bean	4.8	

(20 % variations of these percentages are not abnormal.)

spicular. Needle-shaped.

spider poison. Arachnolysin.

spiegel. (1) Spiegeleisen. (2) The German for mirror.

spiegeleisen. Spiegel. A white cast iron containing 5 to 20 % manganese, obtained in the blast furnace, and used to make manganese steels.

Spiegler Jolle's reagent. A solution of 2 gm. mercuric chloride, 4 gm. succinic acid, and 4 gm. sodium chloride in 100 cc. water; a reagent for albumin in urine.

spigelia. Pinkroot, Indian pink. The dried rhizomes and roots of *Spigelia marilandica*, a Loganiaceae, which contain spigeline. Used, as the fluid extract, as a teniafuge.

spigeline. An alkaloid from Spigelia species.

spike. (1) Plantain. (2) Pepper. **s. nard.** See *spikenard.*

spikenard. The aromatic root of a herb, *Nardostachys Jatamansi*, of the Valerianaceae. **American-** Aralia.

spilanthol. $C_{14}H_{25}NO$ = 213.20. A liquid, $b._{1mm}$ 165, from *Spilanthus acmella* (called *isiSilli* by the Zulus), a Compositae of South Africa; used for toothache.

spin. Angular momentum; rotation around an axis; *e.g.*, of a nucleus or electron.

spinacene. Squalene.

spinacine. A protein derived from spinach leaves, *Spinacia oleracea*, a Chenopodiaceae, soluble in acid or alkaline water.

spinasterol. $C_{28}H_{46}O$ = 398.0. A phytosterol from spinach, occurring as α-, β- and γ-isomers. Cf. *cholane.*

spindle. A hydrometer.

spindle tree. Euonymus.

spinel. $MgAl_2O_4$. Rubicelle, ruby alamandine, ruby balas. A native magnesium aluminate; variously-colored isometric crystals, some of which are used as gems.

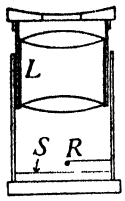
spinels. A group of rock-forming aluminates or ferrates of the type $M''M'''_2O_4$, in which M'' may be magnesium, zinc, manganese, or ferrous iron, and M''' is aluminum, chromium, ferric iron or manganic manganese. They have a high hardness and refractive index.

spinel	$MgAl_2O_4$
hercynite	$FeAl_2O_4$
gaehnite	$ZnAl_2O_4$
magnetite	$FeFe_2O_4$
magnesioferrite	$MgFe_2O_4$
franklinite	$(Fe,Zn,Mn)Fe_2O_4$
chromite	$FeCr_2O_4$

spinneret. (1) A platinum thimble with a flat base containing very minute holes through, which is forced rayon spinning solutions to form filaments. (2) The spinning organ of spiders.

spinning. (1) To revolve around its axis. (2) to form a thread. **s. electron.** The fourth motion of an electron in an atom. Cf. *Pauli's exclusion principle.* **s. power.** The property of a fluid which enables it to be drawn out into threads; as, the white of an egg.

spinthariscope. Scintillascope. An instrument for detecting radioactive rays. It consists of a magnifying glass before a fluorescent screen, and a needle containing a trace of radioactive material on its tip. Each α-particle striking the screen causes a flash and the radiations appear as fluorescent dots, appearing and disappearing irregularly near the tip of the needle.



Spinthariscope. L = eyepiece, R = radioactive matter, S = fluorescent screen.

spinulosin. $C_8H_8O_5$ = 184.1. 3.6.Dihydroxy-4-methoxy-2.5-toluquinone. Purple-bronze plates, m201, having anti-bacterial properties; formed in laboratory cultures of the mold *Penicillium spinulosum* (cf. *penicillin*).

spiracin. Methylcarboxyl salicylic acid. A white crystalline powder, insoluble in water; used as a substitute for salicylic acid.

spiraeic acid. Salicylic acid.

spirane structure. The atomic arrangement,  ; X is an atom held in common by two rings, as in spiro-compounds or borosalicylates.

spirans. A spiro-compound.

Spirillaceae. The third family of the schizomycetes or bactoria; they have curved or wave-shaped cells.

Genus 1; spirosoma—without organs of locomotion.

Group 2; microspira—rigid cells, with few polar flagella.

Group 3; spirillum—rigid cells, with many flagella.

Group 4; spirochetae—flexible and mobile cells.

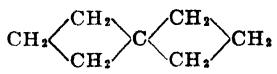
spirit. (1) Any distilled liquid. (2) A solution of a volatile substance in alcohol. (3) Ethanol. **cologne-** Ethanol. **Colonial-** Methanol. **Columbian-** Methanol. **Libavius-** Stannic chloride. **methylated-** Q.v. **motor-** Petrol (England) or gasolin (U. S.). **potato-** A whisky distilled from fermented potatoes. **proof-** See *proof spirit.* **pyroacetic-** Acetone. **pyroligneous-** Methanol. **pyroxylic-** Methanol. **rectified-** 90 % Ethyl alcohol. **silent-** The alcoholic spirit obtained by distillation of a spiritous liquor, before the addition of denaturants or other impurities. **wood-** Methanol.

s. acid. Concentrated acetic acid obtained by distillation of a 12 % vinegar. **s. of alum.** Sulfuric acid. **s. of copper.** Acetic acid obtained from copper acetate. **s. of ethyl nitrite.** Spiritus aethylis nitritis; s. of sweet nitre. An alcoholic solution of 3.5–4.5 % (U.S.P.) or 1.52–2.66 % (B.P.) ethyl nitrite, used in medicine. **s. of hartshorn.** Ammonium hydroxide. **s. of niter.** S. of ethyl nitrite. **s. of salt.** Hydrochloric acid. **s. of tin.** Stannic chloride. **s. of vitriol.** Concentrated sulfuric acid. **s. of wine.** Ethyl alcohol. **s. of wood.** Methanol.

irit(u)ous. Having the character of spirit.

spirit-colors. A group of aniline dyes that are insoluble in water and soluble in alcohol; used in dyeing silk and as stains.

spiro-compounds. Spirans, spirocyclans. A group of organic compounds that comprise two rings joined by one carbon atom common to both rings; as, spiroheptane.



Cf. *ring structures* (E).

spirocyclans. Baeyer's name for spiro-compounds.

spirodecane. $C_{10}H_{18}$ = 138.2. A group of bicyclic hydrocarbons; as,

5, 6-. (7) 
spiroform. $C_{15}H_{12}O_4$ = 256.10. Vesipyrin, acetylsalol, acetylsalicylphenylester, acetylphenyl-o-oxybenzoic acid, $C_6H_4(OOCMe)COOPh$. A white tasteless powder, insoluble in water; used medicinally as an antirheumatic.

spirogyra. A filamentous alga; green felt-like mass or scum in fresh water ponds or tanks; used in biochemical experiments.

spirosal. $C_9H_{10}O_4$ = 182.1. Monoglycosalicylate, **glysal,** $C_6H_4(OH)COOCH_2CH_2OH$. An odorless, colorless liquid, b.170, slightly soluble in water, soluble in alcohol or ether; used medicinally in lotions.

spitting. Small explosions and scattering of materials occurring when certain substances are dried and heated or brought together; as, with sulfuric acid and water, or when molten materials cool and their surface crust is perforated by escaping gases. Cf. *decrepitation.*

splash head. A device fitted to a distillation apparatus between the flask and condenser, to prevent the boiling liquid from splashing over into the latter. It consists usually of an open glass tube in a bulb, bent away from the direction of the flask, along which the vapor passes.

split-product. A decomposition product; *e.g.*, of a hydrolyzed glucoside.

splitting. The breaking of a molecule into two or more individual atoms.

spodumene. $(Li,Na)_2Al_2Si_4O_{12}$. Triphane. A lithium aluminum silicate, occurring in large crystalline masses. The pink variety, (kuntzite) and green variety (hiddenite) are used as gems. Some spodumene crystals are 47 feet long.

spoilage. Any disadvantageous change due to physical or chemical action; as melting of chemicals in warm weather (cf. *shipping*), crystallizing or separating in cold weather, drying out or taking up water (cf. *storage*), or decomposition (cf. *hazard*).

spoilbank. Bing.

sponge. (1) A marine animal, *Euspongia officinalis,* belonging to the Porifera. (2) The flexible fibrous skeleton of the animal cut and dried. It forms yellow porous masses of various shapes. (3) A metal in porous form, as **platinum sponge. iron-** Ferric oxide. **platinum-** Platinized asbestos. **vegetable-** Tufa.

spongin. A sclero-protein from bath sponge which yields diiodotyrosine and bromine.

spontaneous. Sudden or voluntary, and without apparent external cause or incitement. **s. combustion.** Self-ignition of inflammable material caused by the accumulation of heat by slow oxidation.

sporangia. Cells containing spores.

spores. The resting state of micro-organisms. Single cells capable of growth and reproduction.

spot analysis. (1) A microchemical test, carried out on a porcelain plate, for the identification of metals, alkaloids, etc. (2) A reaction on impregnated filter-paper.

spout. (1) A slightly-projecting depression on the rim of a beaker or other vessel through which liquids in the vessel are poured. (2) The cylindrical projection of a teapot. (3) A trough to conduct molten metals.

spray. A stream of air and finely-divided liquid produced with an atomizer, nebulizer or other device. **s. drying.** A form of rapid evaporation, in which a solution is heated in the atomized state so that the dissolved substance falls out of the spray. Cf. *Nyrop process.* **s. residue.** The amount of insecticide remaining on fruits, such as apples, pears, peaches and grapes. The maximum amounts permitted per pound of food are: 0.01 grain, arsenious oxide; 0.018 grain, lead; 0.01 grain, fluorides.

sprays. (1) Pharmaceutical preparations used as antiseptics for throat, nose or other cavities. The principal sprays consist of liquid petrolatum in which the active substances are dissolved, as:

aromatic spray	nebula aromatica
eucalyptol spray	nebula eucalyptolis
menthol spray	nebula mentholis
thymol spray	nebula thymolis

(2) Technical preparations used as insecticides fungicides or disinfectants for protecting plants or trees.

Sprengel pump. A mercury pump for obtaining a high vacuum (0.001 mm.).

spring. A source of a natural water. **hot-** Water emerging from the soil at a temperature higher than 50°C.

spring balance. A device for determining the amount of a force by means of the extension it produces in a spring. (See *Hooke's Law.*)

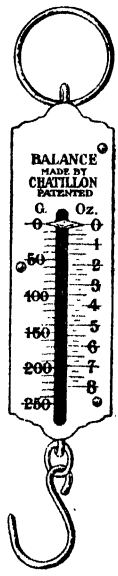
sprinkler. (1) A perforated iron or stoneware plate near the top of a gas-scrubbing tower. It produces a rain of gas-absorbing liquid. (2) A bushing filled with a low melting alloy (*e.g.*, D'Arcet metal) which, when heated, will release water from a pipe system.

sprudel effect. The phenomenon observed on gas-jet electrodes, from which the emerging gas bubbles are rising in a continuous stream or sprudel.

sprue. A projection left on a casting, to be broken off for testing purposes.

spur feterita. Sorghum.

spurred rye. Ergot.



Spring balance.

sputter. To produce a metal in the finely-divided state by passing a high-potential discharge between two electrodes of the metal in a dielectric liquid or gaseous medium.

sputum. Saliva mixed with mucus and other secretions of the mouth or nose. Sputum is usually examined microscopically, but now it is also examined chemically. Its composition varies greatly according to the food eaten, and the time elapsing since a meal:

Organic constituents:	4.1–6.9 %
fatty acids	0.02–0.97 %
soaps	traces–0.40 %
cholesterol	traces–0.16 %
lecithin	traces–0.15 %
nuclein	traces–0.48 %
proteins	0.90–0.52 %
Inorganic constituents	0.3–0.9 %
Water	93.0–95.0 %

sq. Abbreviation for square. **sq. ch.** Square chain. **sq. cm.** Square centimeter, or cm^2. **sq. in.** Square inch. **sq. ft.** Square foot, ft^2. **sq. m.** Square meter, or m^2. **sq. mi.** Square mile. **sq. yd.** Square yard. **sq. rd.** Square rod.

squalene. $C_{30}H_{50}$ = 410.40. Spinacene. An unsaturated hydrocarbon found in the oils of the Elasmobranch fishes (shark family) and, as its homologs, in many marine oils. A colorless oil, $d._{15°}$0.8610, $b._{25mm}$.284. Cf. *carotene, lycopin.*

square. A four-sided figure, whose sides are equal and whose angles are right angles. **s. centimeter.** cm^2. A unit of area and the one-ten-thousandth part of a square meter; 1 cm^2. = 0.155 sq. in. **s. foot.** ft^2. or sq. ft. A unit of area in the English system, 1 ft^2. = 1 sq. ft. = 0.0929 m^2 = 929 cm^2. **s. inch.** in^2. or sq. in. A unit of area in the English system; 1 in^2. = 1 sq. in. = 6.452 cm^2. **s. meter.** m^2. A unit of area in the metric system; 1 m^2. = 10,000 cm^2. = 10.7638 sq. ft. = 1.196 sq. yd. = 24.7104 sq. links = 0.039537 sq. rods = 0.00247104 sq. chains. **s. root.** The square root of a quantity is that quantity which, when multiplied by itself, gives the original quantity. **s. yard.** yd^2., or sq. yd. A unit of area in the English system: 1 sq. yd. = 0.836 m^2.

squaw root. Caulophyllum. **s. vine.** Partridge berries. The dried herb of a small trailing, evergreen plant, *Mitchellá repens.* Used medicinally, as the fluid extract, as a diuretic, astringent, and emmenagogue. **s. weed.** Senecio.

squill. Scilla. The fleshy inner scales of the bulb of *Urginea maritima*, a Liliaceae. It contains several glucosides and bitter principles (scillin, scillitoxin, sinistrin); used medicinally as an emetic and expectorant.

Sr. The symbol for strontium.

St. Abbreviation for stoke.

S.T. Surface tension.

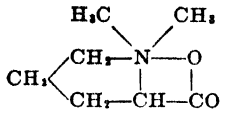
S.T.P. Standard temperature and pressure.

stabile. Stable.

stabilizer. (1) A retarding agent, or a substance that counteracts the effect of a vigorous accelerator and preserves a chemical equilibrium. (2) A substance added to a solution to render it more stable; as, acetphenetidin to cupferron solution, acetanilide to hydrogen peroxide.

stable. A balanced condition not readily destroyed; as, photo-s., thermo-s. **s. scopolamine.** Scopomannite.

stachydrine. $C_7H_{13}O_2N$ = 143.1. A cyclic amino acid and heterocyclic compound occurring in many plant juices (as *Stachys* species) and in mussels (as *Arca noae*). Cf. *trigonelline.*

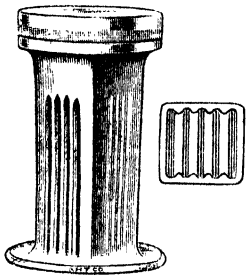


stachyose. $C_{24}H_{42}O_{21}$ = 666.4. A non-reducing tetrasaccharide from the roots of *Stachys tuberifera*, a Labiatae. It hydrolyzes to fructose, glucose and two molecules of galactose; $[\alpha]_D^{20}$ + 148°.

stagonometer. Stalagmometer.

Stahl, Georg Ernst. 1660–1734. A German physician and chemist, noted for his development of the phlogiston theory (1697).

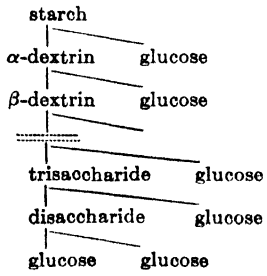
stain. A substance that is used for coloring materials such as wood, tissues, textiles. *Stains* are *dyes* in solutions; *paints* are *pigments* in suspensions. **acid proof-** See *table top impregnation*. **contrast-** q.v. **counter-** q.v. **microscope-** A dye used for staining preparations for microscopic examination.



Staining jar.

staining. The coloring of materials by colored solutions. In microscopy it is used for differentiating structural elements. **s. jar.** A small, square glass vessel used in staining microscopic slides (see illustration).

staircase reaction. A chemical change that proceeds step-wise; as, the hydrolysis of starch to glucose:



stalactite. A hanging column of calcite formed by the drip of carbonated mineral solutions from the roof of a cavern.

stalagmite. A standing column of calcite formed by the drip of carbonated mineral solutions on to the floor of a cavern.

stalagmometer. A device for obtaining drops of a liquid at definite intervals; *e.g.*, Traube's s., used to calculate surface tension by determining the number of liquid drops passing an orifice in a given time. It can also be used to determine molecular weight (cf. *Morgan equation*) and the association of liquids.

stalagmometric. Measuring the progress of chemical reactions (as esterifications) from the change in surface tension.

stalagmones. Characteristic substances occurring in urine and lowering its surface tension. They are associated with certain diseases (as, tuberculosis, carcinoma, nephritis) and severe infections, and occur normally in pregnancy.

stalloy. An alloy of iron with 3–4 % silicon.

stamen. The male organ of a plant, in which the pollen is prepared. Cf. *pistil*.

Stammer, Carl. 1828–1890. A German chemist noted for his development of the sugar industry.

stamp. (1) To break up or crush ore and rock by machinery. (2) A heavy mechanical pestle for crushing ore. **s. battery.** A group of pestles working mechanically in an iron mortar. Stamps are as heavy as 2000 pounds, and drop 6–8 inches 100 times per minute. **s. mill.** An establishment for crushing ores by stamp batteries.

stand oil. An oil heated at 250–300°C without addition of oxygen or driers, and allowed to settle to remove coagulated "mucilage."

standard. (1) An established form of quality or quantity. (2) A substance used for establishing the strength of volumetric solutions; as, purified oxalic acid used as a standard in alkalimetry and acidimetry. **s. candle.** A spermaceti candle that burns 120 grains per hour. (See *standard lamp.*) **s. cell.** An electrolytic cell having a definite voltage; as, the Clark and Weston cells. **s. conditions.** In gas analysis an atmospheric pressure of 760 mm., and a temperature of 0°C., at latitude 45°. It is sometimes abbreviated, S.T.P. (= standard temperature and pressure). Cf. *N.T.P.* **s. deviation.** The expression $\sqrt{PQ/N}$, where P and Q are the percentages of positive and negative reactions, respectively, and N is the number of tests made. **s. lamps.** A source of light for photometric determinations of a known light intensity; as,

pentane lamp.....	10.00 international candles
Hefner lamp.....	0.9 international candle
Carcel lamp.....	9.6 international candles
standard candle....	1.0 international candle

s. meter. The length between two lines ruled on a bar of platinum-iridium, which is kept at the International Bureau of Weights and Measures, Sèvres, near Paris. **s. pressure.** A pressure equal to a column of 760 mm. mercury at sea-level in lat. 45°. **s. solution.** A solution of definite concentration, usually normal, half normal or tenth normal. **s. substance.** A substance used to standardise volumetric solutions. It should have the following properties: (1) easily obtained in a state of sufficient purity; (2) unaltered in air and at moderate temperatures, and neither hygroscopic nor efflorescent; (3) readily soluble in water or alcohol; (4) a high molecular weight, thus lessening effects of errors in weighing. (5) produce no interfering product on titration; (6) free from color before and after titration, thus avoiding interference with the indicator. **s. temperature.** A temperature of 0°C. or 273°A. **s. thermometer.** A thermometer, as prescribed by the United States Pharmacopoeia. **s. volume.** The normal volume occupied by one mole of a gaseous substance, *i.e.*, 22.4 liters. **s. wavelength.** The wave-length of the red cadmium line, observed in air at 15°C. and 760 mm. pressure. It is equal to 6438.4696 Ångstrom Units. The cadmium blue and green lines are also used.

standardization. The manipulations necessary to bring a preparation to an established or known quality; as, the preparation and adjustment of a standard solution in volumetric

analysis. **physiological-** The testing of drugs or biological products (which cannot be chemically analyzed) by their pharmacological action on a normal animal. Thus:

digitalis	frog heart
strophanthus	frog heart
ergot	rooster (cocks comb)
aconite	guinea pig (toxicity)
cannabis	dog (intoxication)
adrenalin	dog (blood pressure)

standardized. Describing a utensil, device or preparation that has been tested, measured and compared with a standard. See *Bureau of Standards* (B.S.), *National Physical Laboratory* (N.P.L.), *volumetric glass ware.* **s. buret.** A certified buret checked at 20°C. according to the methods of the Bureau of Standards or the National Physical Laboratory. The limits of error are: (B.S.)

Capacity	30 cc.	50 cc.	100 cc.
Limit of error	0.03 cc.	0.05 cc.	0.1 cc.

s. cylinder. A certified graduated cylinder checked according to the methods of the B.S., or N.P.L. The limits of error are: (B.S.)

Capacity	10 cc.	25 cc.	50 cc.
Limit of error	0.05 cc.	0.12 cc.	0.25 cc.

Capacity	100 cc.	250 cc.	500 cc.
Limit of error	0.2 cc.	1.25 cc.	2.5 cc.

s. flask. A certified graduated flask checked according to the methods of the B.S. or N.P.L. The limits of error are: (B.S.)

Capacity	50 cc.	100 cc.	200 cc.
Limit of error	0.50 cc.	0.08 cc.	0.10 cc.

Capacity	500 cc.	1000 cc.
Limit of error	0.15 cc.	0.30 cc.

s. pipet. A certified pipet tested according to the methods of the B.S. or N.P.L. The limits of error are: (B.S.)

Capacity	2 cc.	5 cc.	10 cc.
Limits of error for measuring pipet	0.01 cc.	0.02 cc.	0.03 cc.
transfer pipet	0.006 cc.	0.01 cc.	0.02 cc.

Capacity	25 cc.	50 cc.
Limits of error for transfer pipet	0.03 cc.	0.05 cc.

s. solution. See *solutions.*

standards. The agencies establishing or defining s. in various countries are:

A.S.A.	American Standards Association
B.S.I.	British Standards Institution
D.V.M.	German Association for Testing Materials
A.F.N.O.R.	French Association for Standardising Materials
S.A.A.	Standards Association of Australia
S.O.S.	Swedish Standards Society
S.V.M.T.	Swiss Society for Testing Materials
C.E.S.A.	Canadian Engineering Standards Association
I.S.A.	International Standards Association (Basle)

stannanes. A group of organic compounds containing tetravalent tin; as,

tetramethyl-	$SnMe_4$
tetraethyl-	$SnEt_4$
tetraphenyl-	$SnPh_4$
dichlorodiphenyl-	$SnCl_2Ph_2$
bistannane	$H_3Sn.SnH_3$
tristannane	$H_3Sn.SnH_2.SnH_3$

Cf. *phenylstannane.*

stannate. A salt of stannic acid of the type, M_2SnO_3. **sulfato-** A compound of the type $R_2H_2Sn(SO_4)_3$. Cf. *stannosulfate.* **sulfo-** A salt of the type, M_2SnS_2. **thio-** A salt of the type, M_2SnS_3.

stannated. Treated with tin salts: as, s. hydrochloric acid used in the Gutzeit test.

stannekite. $C_{20}H_{22}O_3$. A native, resinous hydrocarbon, in coal deposits in Bohemia.

stannic. A compound of tetravalent tin. **s. acids.** A series of acids which vary in composition from H_2SnO_3 to H_4SnO_4. *normal-* or alpha- H_2SnO_3 = 168.7. A white amorphous powder; insoluble in water or alcohol, soluble in alkalis. *meta-* or beta- $H_{10}Sn_5O_{15}$ = 843.6, $H_2Sn_3O_{11}$ or H_2SnO_3. A colorless amorphous powder; insoluble in alcohol or water, soluble in alkalis. **s. bromide.** $SnBr_4$ = 438.4. A colorless, fuming, caustic liquid, d.3.349, m.31, b.203, soluble in water, decomp. by alcohol; used as a mordant and in tinning. **s. chloride.** $SnCl_4$ = 260.5. Tin bichloride or tin tetrachloride. A colorless, fuming, caustic liquid, d.2.2738, m.−33, b.114; soluble in water, decomp. by alcohol; used as a mordant in dyeing and reviving colors, as a reagent, and for tinning. **s. chromate.** $Sn(CrO_4)_2$ = 350.7. A brownish-yellow crystalline powder, soluble in water; used in ceramics as pigment. **s. ethide.** Tin tetraethyl. **s. ethyl hydroxide.** Tin ethyl hydroxide. **s. fluoride.** SnF_4 = 194.7. A white, crystalline deliquescent solid, $d_{20°}$.4.78, sublimes if heated, b.705. **s. hydroxide.** $Sn(OH)_4$ = 186.5. A white amorphous powder; insoluble in water or alcohol. **s. ion.** The tetravalent cation Sn^{++++}. **s. iodide.** SnI_4 = 626.4. Tin tetraiodide. A red crystalline powder, d.4.696, m.144, b.341, decomposed by water, soluble in alcohol, ether or chloroform. **s. methide.** Tin tetramethyl. **s. oxide.** SnO_2 = 150.7. Tin dioxide, tin ash, flowers of tin, stannic anhydride. A white amorphous powder, d.6.95, m.1197, insoluble in water or alcohol, and soluble in alkalis. Used as a polishing material for steel, glass and finger nails, and in the manufacture of milk-colored and opaque glass. **s. phenide.** Tin tetraphenyl. **s. sulfate.** $Sn(SO_4)_2.2H_2O$ = 346.9. Colorless rhombic crystals; soluble in water. **s. sulfide.** SnS_2 = 183.80. Tin bisulfide, mosaic gold, tin bronze. A yellow, hexagonal, crystalline powder, d.4.58, decomp. at red-heat, insoluble in water, soluble in alkalis; used for bronzing and gilding.

stannising. A process for coating metal objects of complicated shape with tin, by suspending them for a few minutes in a mixture of vapours of hydrogen and stannous chloride at 500–600°C.

stannine. Stannite.

stannite. $SnS_2.Cu_2S.FeS$. Stannine, tin pyrites. A native sulfide of tin, copper and iron.

stannites. Theoretically a salt of stannous acid of the type, M_2SnO_2 derived from stannous hydroxide. There is no evidence for this, and the actual composition is $MHSnO_3$ or HSnOOM (cf. HCOOM).

stannonate. A salt of the type RSnOOM.

stannonic acid. A group of organic compounds of the types, $RHSnO_2$, or R.SnOOH. **s. ester.** A group of organic compounds of the types, $RR'.SnO_2$, or, RSnOOR'.

stannonium. An organic compound of tetravalent tin of the type $RSnH_3$. Cf.-*onium*, *stannane*, *stannyl*.

stannosulfate. A salt of the type $M_2Sn(SO_4)_2$. Cf. *sulfatostannate*.

stannous. A compound containing divalent tin, Sn=. **s. bromide.** $SnBr_2$ = 278.5. Tin protobromide. Yellow crystals, d.5.117, m.215, b.619, soluble in water, decomp. by alcohol. **s. chloride.** $SnCl_2$ = 189.6. Tin salt, tin protochloride. A white crystalline mass, m.247, b.620, soluble in water, alcohol, or alkalis. It absorbs oxygen from the air, forms an insoluble oxychloride, and is used as a reagent and reducing agent, and as a mordant in the manufacture of lakes. *hydrous*-$SnCl_2.2H_2O$ = 225.7. Colorless triclinic crystals, d.2.7, m.37.7, decomp. by further heat, soluble in water or alcohol; used as a reagent and in organic synthesis. **s. chromate.** $SnCrO_4$ = 234.6. A brown powder; slightly soluble in water; used in ceramics as a pigment. **s. citrate.** $SnC_6H_6O_7$ = 308.5. Tin citrate. A white powder; slightly soluble in water. **s. ethide.** Tin diethyl. **s. fluosilicate.** $SnSiF_6$ = 260.76. S. silicofluoride. Colorless prismatic crystals, very soluble in water. **s. hydroxide.** $Sn(OH)_2$ = 152.7. An amorphous white powder; insoluble in water and soluble in fused alkalis with formation of stannites. **s. iodide.** SnI_2 = 372.5. Red needles, m.316; slightly soluble in water, soluble in dilute acids or alkalis. **s. ion.** The divalent cation, Sn^{++}. **s. oxalate.** SnC_2O_4 = 206.7. A white crystalline powder, insoluble in water, soluble in acids; used in dyeing. **s. oxide.** SnO = 134.7. Tin monoxide, t. protoxide. A brownish-black powder, d.6.3, burns on heating, insoluble in water, alcohol or alkalis; used as a reducing agent. **s. sulfate.** $SnSO_4$ = 214.8. A white crystalline powder, soluble in water, alcohol or acids; used as a mordant in dyeing. **s. sulfide.** SnS = 150.8. A brown crystalline powder, d.5.08, m.882, b.1230, insoluble in water or alcohol, soluble in hydrochloric acid; decomp. at red heat. **s. tannate.** $SnC_7H_2O_5.H_2O$ = 302.7. A dark brown crystalline powder; insoluble in water. **s. tartrate.** $SnC_4H_4O_5$ = 250.7. A white crystalline powder, soluble in water; used as a mordant in dyeing and printing textiles.

stannum. The Latin term for tin.

stannyl. The monovalent radical, H_3Sn—.

staphisagria. Stavesacre seed. The ripe seeds of *Delphinium staphisagria*, a Ranunculaceae. It contains a number of alkaloids, and is used externally as an insecticide. **s. alkaloids.** The alkaloids of staphisagria:

staphisagrine	$C_{22}H_{33}O_5N$
delphinine	$C_{22}H_{35}O_6N$
delphinoidine	$C_{22}H_{35}O_5N$
delphisine	$C_{27}H_{46}O_4N_2$
staphisagroine	$C_{20}H_{24}O_4N$

staphisagrine. $C_{22}H_{33}O_5N$ = 391.3. Staphisaine. An alkaloid from staphisagria.

staphisagroine. $C_{20}H_{24}O_4N$ = 342.20. An alkaloid from staphisagria.

staphisaine. Staphisagrine.

Staphylococcus [pl.-cocci]. A genus of *Coccaceae* (Schizomycetes) forming grape-like clusters, many of which are pathogenic and produce pus; see *bacteria*.

staphylotoxin. A poisonous substance produced by staphylococcus cultures.

staple fiber. See fiber.

star. (1) A group of needle-shaped crystals, which radiate from a common center. (2) A sun-like body outside the solar system. See *spectral classification*. (3) A burner-attachment for holding small vessels. **blazing-** Aletris. **s. anise.** See *anise*. **s. grass.** Aletris.

starch. $(C_6H_{10}O_5)_x$ = $(162.1)_x$. Amylum. A group of carbohydrates or polysaccharides occurring in many plant cells. The ordinary starch or potato starch is a white, soft, amorphous powder, d.1.5; insoluble in water, alcohol, or ether. It hydrolyzes in "staircase" (q.v.) fashion to several forms of dextrin and glucose. Its structure is not yet completely known; but the starch granules consist of at least two fractions: (1) An envelope (80 %) of *amylopectin*, *α-amylose* or *α-starch*, which is less soluble, contains a phosphoric acid ester, yields a paste and gives a violet color with iodine; and (2) an inner substance, *amylose*, *β-amylose*, or *β-starch*, which is more soluble, free from phosphorus, does not yield a paste, and turns blue with iodine.

	α-amylose, per cent	β-amylose, per cent
corn-	15	85
potato-	3	97
rice-	12	88
tapioca-	16.5	83.5
wheat-	23.5	76.5

allant- Inulin. **animal-** Glycogen. **cassava-** Tapioca. **corn-** Amylum. The starch granules obtained from the fruit of *Zea mays*, Indian corn. Used as paste, for starching fabrics, as a dusting powder; as a food and antidote for iodine; and chemically, as a reagent and indicator for iodine. **lichen-** Lichenin. **rice-** Rice flour. The starch granules from the seeds of *Oryza sativa*, rice. Used as nutrient, for starching fabrics and for pastes. **nitro-** See *nitrostarch*. **soluble-** See *s. soluble*. **wheat-** The starch granules from the seeds of *Triticum vulgare*, wheat; used as a reagent, for pastes and in starching fabrics. (See illustration.)

s. glycerite. A protective colloid prepared by heating starch with glycerol and diluting with water. **s. gum.** Dextrin. **s. iodide. s. iodized.** Starch iodide. A bluish-black powder containing 2 % iodine, insoluble in water; used medicinally as an antiseptic. It is produced by the reaction of starch and a solution of iodine, and is used as a test for either. **s. nitrate.** Nitrostarch. **s. soluble.** $C_{36}H_{62}O_{31}.H_2O$. Amylodextrin. A hexasaccharide and white powder obtained by heating starch with glycerin. It gives a yellow color with iodine solution, is soluble in water and is used as an indicator, emulsifying agent, and in the textile industry. **s. sugar.** A dextrose obtained by heating starch with dilute sulfuric acid. It

Starches.

From: Hawk and Bergeim, Practical Physiological Chemistry.

consists of 1 part dextrose and 2 parts glucose, and is used as a syrup.

Stark effect. The action of an intense electric field causes a separation of the lines of a positive ray spectrum.

starlite. An artificial gem of a brilliant light green or blue color. Blue zircon of Siam is burned from 6 to 8 hours and treated with cobalt nitrate or potassium ferrocyanide. See *zircon.*

starter. A mixture of a culture of a suitable organism and nutrient medium, used to initiate large-scale fermentation; *e.g.*, in formation of cheese from milk curd, a culture of lactic acid-producing streptococci.

Stas, Jean Servais. 1813–1891. A Belgian chemist, noted for his determination of atomic weights. **S. pipet.** A pipet, the jet of which has parallel walls so that the contents run out and the level stops at the same point each time.

stassanization. A method of sterilization by heat, similar to pasteurization. Milk is heated at 167°F. for 15–20 seconds, and then cooled rapidly to 40–45°F.

Stassfurt salts. A large deposit of oceanic salts, mainly chlorides and sulfates, found in the Magdeburg Halberstadt region in northern Germany; the principal salts are rock salt and anhydrite. Cf. *abraum salts.* The deposits are arranged in layers under a top alluvial deposit and sandstone and include:

Sulfates:

anhydrite	$CaSO_4$
gypsum	$CaSO_4.2H_2O$
glauberite	$CaSO_4.Na_2SO_4$
polyhalite	$2CaSO_4.MgSO_4.K_2SO_4.2H_2O$
krugite	$4CaSO_4.MgSO_4.K_2SO_4.2H_2O$
kieserite	$MgSO_4.H_2O$
epsomite	$MgSO_4.7H_2O$
vanthoffite	$MgSO_4.3Na_2SO_4$
bloedite	$MgSO_4.Na_2SO_4$
loewite	$MgSO_4.2Na_2SO_4.2\frac{1}{2}H_2O$
langbeinite	$2MgSO_4.K_2SO_4$
leonite	$MgSO_4.K_2SO_4.4H_2O$
picromerite	$MgSO_4.K_2SO_4.6H_2O$
schoenite	$MgSO_4.K_2SO_4.9H_2O$
aphthitalite	$K_3Na(SO_4)_2$
kainite	$MgSO_4.KCl.3H_2O$
celestite	$SrSO_4$

Chlorides:

halite or rock salt	NaCl
sylvite	KCl
sylvinite (sylvine)	(K, Na)Cl
douglasite	$2KCl.FeCl_2.2H_2O$
carnallite	$KMgCl_3.6H_2O$
tachhydrite	$2MgCl_2.CaCl_2.12H_2O$
bischofite	$MgCl_2.6H_2O$
baeumlerite	$KCl.CaCl_2$
rinneite	$FeCl_2.3KCl.NaCl$

stassfurtite. A double salt of magnesium borate and chloride from Stassfurt.

state. (1) A condition. (2) A form of aggregation or dispersion; as, colloidal-, (3) Orbit, energy level. The condition of an electron in a neutral or ionized atom. **activated-** See *activation.* **amorphous-** Non-crystalline. Describing a homogeneous solid in which the molecules are not symmetrically oriented. Cf. *crystal.* **change of-** See *change.* **colloidal-** Matter in finely-divided particles, surrounded by another medium. See *colloidal systems.* **crystalline-** A homogeneous, anisotropic solid, in which the atoms are symmetrically oriented. **d-** See *orbital.* **dissociated-** See *dissociation.* **dynamic-** The condition of the atoms in an ion, as opposed to the static s. **equation of-** See *equation, gas laws.* **excited-** See *excitation.* **f-** See *orbital s.* **fluid-** Molten, liquid, or gaseous s. **gaseous-** A condition in which the molecules are in rapid and irregular motion. See *gas.* **irradiated-** See *irradiation.* **liquid-** A condition between the solid and gaseous state. **luminescent-** See *luminescence.* **molten-** A liquid s. above melting point temperature. **nascent-** A newly-formed atom or molecule. Cf. *status nascendi.* **orbital-** The position towards which electrons may fall during a quantum transition; as:

Final state	Electrons are in	Spectral lines produced belong to
s	lowest quantum state	sharp series
p	↓	principal series
d	↓	diffused series
f	highest quantum state	fuzzy series

Cf. *orbits, series.* **p-** See *orbital s.* **quantum-** See *energy levels.* **radiant-** See *incandescence, luminescence, fluorescence.* **s-** See *orbital s.* **solid-** A condition in which the molecules are in slow motion as compared with the liquid s., and in which they are held in more or less rigid and definite positions, which may be symmetrical (crystalline s.) or non-symmetrical (amorphous s.). **static-** The condition of atoms in a molecule, as opposed to dynamic-. **steady-** (1) A balance between intake and output, or between the formation and decomposition of a substance. (2) If in a chain of reactions, A→ B→ C, the amount or concentration of reactant B remains constant, while that of A decreases, and that of C increases; then, B is in the steady state.

static. (1) The condition of rest or equilibrium as opposed to motion (dynamic). (2) The interference with wireless radiations produced by atmospheric electric charges or by the presence of other sources of electricity.

s. atom. See *Lewis-Langmuir atom.* **s. electricity.** An electrical charge at rest; often produced by friction.

statics. A branch of science that deals with matter and forces in a state of equilibrium.

statistics. (1) The science of classifying numerical facts, judging collective numerical data, and determining probabilities from values obtained by enumeration or estimation. "The mathematics of experiment" (Mather). (2) In particular the consideration of conditions and properties of matter (as the *average* normal value of a group of units) rather than the *actual* value of a single unit. Cf. *Heisenberg principle, histogram, atomic* and *isotopic weights.*

stator. The stationary portion of a machine, as distinct from the revolving portion, rotor (q.v.).

status nascendi. The nascent (q.v.) state, or the condition of a molecule at its formation during a chemical reaction. Many elements are more active when newly-formed (as hydrogen), and it is assumed that in this state there exist free

atoms, H, that have not combined into the molecule, H_2. Cf. *excitation*.

staubosphere. The dust content of the atmosphere. [German, staub = dust.]

staurolite. Staurotide. An iron aluminum silicate, sometimes used as a gem.

staurotide. Staurolite.

stavesacre seed. Staphisagria.

steam. Water vapor. **superheated-** Water vapor that is heated under pressure to a temperature above 100°C.

s. bath. A vessel surrounded by steam with or without pressure. **s. black.** Hematoxylon. **s. distillation.** Distillation by blowing steam through the liquid, to obtain a distillate consisting of water and substance. **s. gauge.** See *pressure gauge*.

steapsase. Steapsin. A lipase of the pancreatic juice that hydrolyzes fats to glycerol and free acids.

steapsin. Steapsase.

steapsinogen. The substance from which steapsase is formed or liberated.

stearaldehyde. $C_{17}H_{35}CHO$ = 268.28. Octadecanal*. White scales, m.63.5, $b._{100mm}$261.

stearamide. $C_{18}H_{37}NO$ = 283.3. Octadecanamide*, stearic amide, $Me(CH_2)_{16}CONH_2$. White leaflets, m.109.

stearate. A salt or ester of stearic acid of the type, $C_{17}H_{35}COOM$, in which M is a monovalent metal or radical.

stearic acid. $C_{18}H_{36}O_2$ = 284.38. Octodecanoic acid*, *n*-octodecylic acid. A monobasic fatty acid, $CH_3(CH_2)_{16}COOH$, occurring in many vegetable and animal fats. Colorless, shining leaflets, $d._{70°}$0.852, m.69, $b._{100mm}$291, insoluble in water, soluble in alcohol or ether. **s. aldehyde.** Stearaldehyde. **s. amide.** Stearamide.

stearin. (1) $C_{57}H_{110}O_6$ = 891.0. Tristearin, glycerol tristearate, $C_3H_5(C_{17}H_{35}COO)_3$. A colorless crystalline mass, the chief constituent of many fats, $d._{65°}$0.943, m.71; insoluble in water, soluble in alcohol or ether. (2) *commercial-* A mixture of fatty acids, prepared from fats by hydrolysis; used in the manufacture of candles and solid alcohol. **lauro-** Laurin.

stearolic acid. $C_{18}H_{32}O_2$ = 280.3. *9*-Octadecynoic acid*. The unsaturated acid, $Me(CH_2)_7C{:}C(CH_2)_7COOH$. Colorless prisms, m.48, b.260; insoluble in water, slightly soluble in alcohol, soluble in ether.

stearone. $C_{35}H_{70}O$ = 506.74. *18*-Pentatriacontanone*, $(C_{17}H_{35})_2CO$. A solid, d.0.80, m.88, insoluble in water, soluble in hot alcohol or ether.

stearonitrile. $C_{17}H_{35}CN$ = 265,28. Octadecanenitrile*. Colorless crystals, m.41.

stearoptene. Oleoptene. The oxygenated portions of an essential oil consisting chiefly of the solid part (camphor, as opposed to the liquid part; as, eleoptene). *E.g.*, camphor of camphor oil; menthol of peppermint oil; thymol of thyme oil.

stearoxylic acid. $C_{18}H_{32}O_4$ = 312.35. *9.10*-dioxooctadecanoic acid*, $Me(CH_2)_7CO.CO(CH_2)_7COOH$. A solid, m.86, insoluble in water, slightly soluble in alcohol or ether.

stearyl. Octodecanoyl*. The monovalent radical, $C_{17}H_{35}CO$—, derived from stearic acid.

steatite. A variety of talc.

stechiometry. Stoichiometry.

steel. (1) Carbon steel. A tough, elastic alloy of iron containing small quantities of carbon:

mild or soft steel	less than 0.15 % C
medium steel	0.15–0.30 % C
hard steel	more than 0.30 % C

COMPOSITIONS OF TYPICAL STEELS

S.A.E. number	Per cent C	Per cent Mn	Per cent P, S	Per cent Cr

9260	0.6	0.75	c.g.	....	2.0

(2) Range is ±0.05 % C.
(3) Range is ±0.15 % Mn.

(4) Maximum is (*a*) 0.035 % P, (*b*) 0.04 % P, (*c*) 0.045 % P, (*d*) 0.06 % P, (*e*) 0.04 % S, (*f*) 0.045 % S, (*g*) 0.05 % S, (*h*) 0.15 % S.

(5) Range is ±0.15 % Cr (* is nickel).

(6) Range for Ni ±0.25; for Mo ±0.05; for V ±0.03; for W ±0.25 and for * ±1.5; for Si ±0.2 %.

For phase diagram, see *iron*. World production (1941) 143,000,000 long tons (for order of countries, see *iron*). (2) Alloy steel. An alloy of iron whose properties are due to an element or elements other than carbon; such as, chromium, manganese, nickel, tungsten, silicon. Cf. *S.A.E. classification, ferrochromium, ferromanganese.*

alloy- A mixture of iron and some other metal, fused together and cooled rapidly. **alloy treated-** A steel which contains small quantities of other metals, incorporated during its manufacture for curative purposes, and not intended to produce the distinct properties of an alloy steel. *E.g.*, a steel containing less than 1 % Mn, or 0.3 % Si. **austenic-** A s. containing 18 % Cr, 8 % Ni and 1–4 % Mo; used for acid-resisting utensils (not corroded by HNO_3 or H_2SO_4). **bullet-proof-** S. containing 12 % Mn, 1 % C and less than 0.02 % P or S. **carbon-** An alloy of iron and carbon, variously treated, without the addition of other metals. **chrome-molybdenum-** An alloy of iron and 0.8–1.1 % Cr, 0.4–0.6 % Mn, 0.15–0.25 % Mo and 0.25–0.35 % C; used in the framework of aeroplanes. **chromium-nickel-** See *stainless-*. **high speed-** An alloy of iron containing 0.65 % C, 0.2 % Mn, 4 % Cr, 17 % W, and 5 % V. The tungsten can be replaced by 8.5 % Mo. It is used for tools and does not lose temper if heated. **nickel-** See *nickel*. **nickel-zirconium-** A tough, tenacious alloy of iron and 2 % Ni, 0.34 % Zr, 1 % Mn, 15 % Si and 0.4 % C, used for armor plates and helmets. **stainless-** A steel which contains elements such as nickel and/or chromium; it does not tarnish on exposure and is used for high-grade cutlery, kitchen- and tableware, etc. **super-** A high-speed steel containing 4 % cobalt. Cf. *carboloy*.

Steele microbalance. A quartz instrument which consists of a beam with a small quartz-ball, whose buoyancy is changed by increasing or decreasing the air pressure. It is the most delicate balance, and is sensitive to 4×10^{-6} mg.; with its aid the density of 0.1 cubic millimeter of radium emanation was determined by Ramsay and Gray.

Steenbock unit. A vitamin unit, q.v.

Stefan-Boltzmann equation. An equation indicating the radiations per square centimeter radiated per sec. by a black body at absolute temperature, T, to surroundings at absolute temperature t_0: $E = \sigma(T^4 - t_0^4)$. (Cf. *Wien's equation.*) **S. constant.** The constant, σ (sigma), of the Stefan-Boltzmann equation: $\sigma = 5.72 \times 10^{-12}$ watt/cm.²/degree. **S. law.** The total amount of energy (E in ergs) radiated from a black body (which is a perfect radiator) and due to heat alone, is proportional to the fourth power of the absolute temperature; $E = \sigma T^4$, where σ is 5.72×10^{-5}.

steigerite. $Al_2O_3.V_2O_5.6\frac{1}{2}H_2O$. A yellow mineral found in the uranium deposits of Colorado.

stellar. (1) Pertaining to stars. (2) Star-shaped; as, crystals. **s. evolution.** See *spectral classification.* **s. spectra.** See *spectral classification.*

stellate crystals. Stellar- or star-shaped crystals; as, phenyl glucosazone.

stellite. An alloy of steel with cobalt and 10–50 % chromium and/or tungsten, used for high-speed tools and instruments.

stem correction. The correction to be applied to a thermometer reading to allow for the portion of the mercury column not in the liquid.

stench. (1) An obnoxious odor. (2) A group of malodorous gases used industrially; as, in mine warnings. They are mercaptan, butyl mercaptan, amyl acetate, butyric acid or valeric acid.

stenocarpine. Gleditschine.

stenosation. A process for increasing tensile strength (*e.g.*, of viscose fibers) by treatment with formaldehyde.

stenosine. Sodium methyl arsenate.

stephanite. $5Ag_2S.Sb_2S$. A native silver, antimony sulfide.

step-wise decomposition. A staircase reaction (q.v.); decomposition that proceeds gradually in a series of reactions. **s. dissociation.** A gradual dissociation.

steradian. The solid angle which is subtended by a surface of a sphere equivalent to the square of the radius.

stercobilin. $C_{33}H_{46}N_4O_6 = 594.5$. The normal pigment of feces, m.236, it is probably urobilin.

stercorol. Coprosterol.

stercorite. $Na(NH_4)HPO_4$. Native microcosmic salt.

sterculia. A genus of tropical plants, some of which yield edible seeds and barks; used for cordage and mats. **s. gum.** Indian tragacanth, Indian gum. A tragacanth-like exudation from *Sterculia* species, a group of trees and shrubs of India; used as a filler in ice-cream. Cf. *hog* gum.

Sterculiaceae. A group of soft-wood trees or shrubs:

Cola acuminata..... kola nut
Theobroma cacao.....cocoa, cacao butter

Cf. *adansonia, heretine, kapok.*

stere. A kiloliter or 1000 liters (nearly 1 cubic meter).

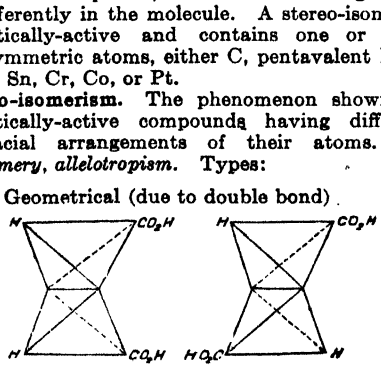
stereo- (1) A prefix derived from the Greek, indicating "solid" in structure or "three dimensional." (2) Abbreviation for stereotype.

stereochemistry. Spatial or configurative chemistry. A branch of science that investigates the spatial arrangement of the atoms in a molecule.

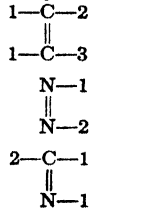
stereo-isomer. Stereomer. A compound containing the same number and kind of atoms as another compound, but with the atoms grouped differently in the molecule. A stereo-isomer is optically-active and contains one or more asymmetric atoms, either C, pentavalent N, S, Se, Sn, Cr, Co, or Pt.

stereo-isomerism. The phenomenon shown by optically-active compounds having different spacial arrangements of their atoms. See *isomery, allelotropism.* Types:

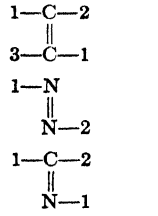
A. Geometrical (due to double bond)



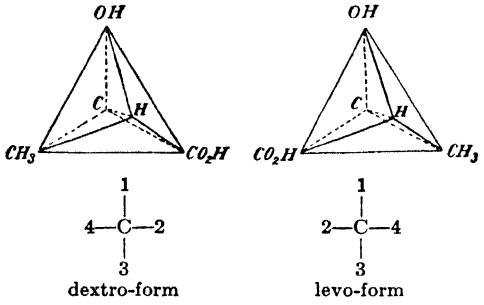
Plane symmetric cis- or syn- form



Axial symmetric anti- or trans- form



B. Optically-active (due to asymmetric atom)



stereomer. See *stereo-isomer.*

stereopticon. Balopticon. An instrument that projects an amplified image of an object.

stereoscope. A device for viewing a pair of photographs each simultaneously with one eye, and thus obtaining a perspective effect.

stereoscopic photographs. Two adjacent photographs of the same object, taken on the same plate at the same time, with two lenses. They are used to give depth and perspective to the picture.

stereoskiagraphy. The production of stereoscopic x-ray pictures; used to locate an opaque object in the human body.

stereotyping. An operation in printing in which the original type is used to emboss a plastic paper sheet (flong), which is then hardened and used to cast metal type for high-speed rotary letterpress machines.

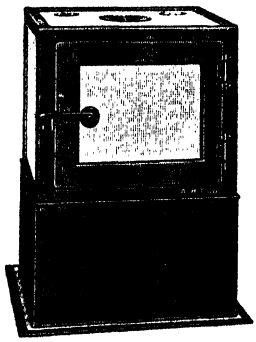
steric. Pertaining to the spatial arrangement of atoms in the molecule. **s. hindrance.** The non-appearance of the chemical reaction expected from a structural formula (two-dimensional); it is explained by the spatial arrangement of the atoms (three-dimensional). The presence of a particular atomic grouping in a certain position may inhibit or encourage the reaction.

sterid. Steroid.

steride. A tertiary lipid in which the alcohol is a sterol.

sterile. Aseptic or free from microorganisms. **s. solution.** A solution that has been made aseptic by the destruction or removal of all microorganisms.

sterilization. The destruction or removal of all living bacteria, microorganisms and spores. It is accomplished either physically (heat, sound, light, filtration) or chemically (antiseptics).



Hot air sterilizer.

sterilize. To render free from all living microorganisms and their spores.

sterilizer. An autoclave, steam or bake-oven, or other device for sterilization.

sterilizing The act of destroying or removing bacteria and their spores. Methods:

Glass and metal utensils:

(1) heat for two hours at 160–170°C. in a hot air oven;

(2) heat in a closed vessel (autoclave) under steam pressure at 115—120°C. for 15 minutes;

(3) heat in a current of steam for 30 minutes;

(4) boil in water for 20 minutes;

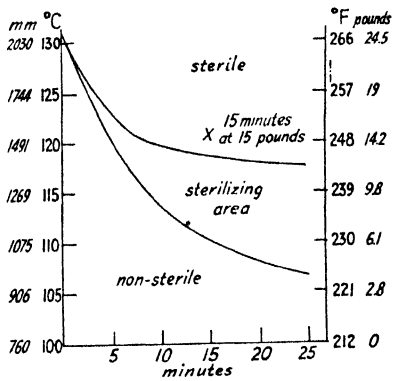
(5) boil in a solution of sodium bicarbonate (1:1000) for 20 minutes.

Solutions in their containers:

(1) If the solution is not decomposed by heat, proceed as above.

(2) If the solution is decomposed by heat, filter through a stone, porcelain, or alundum filter, the entire apparatus having been previously sterilized.

s. area. A pressure-temperature diagram on which the thermal death-points of all bacteria are marked by a wedge-shaped figure (see illustration).



Sterilizing with steam.

sternbergite. $Ag_2S.Fe_4S_5$. A native sulfide of iron and silver.

sternutatives. An agent that produces sneezing. **poison gas-** Substances that are used in explosive shells and cause, on liberation, violent sneezing; as, diphenylchlorarsine, ethyldichlorarsine, and diphenylcyanoarsine.

sternutatory. Able to produce sneezing.

steroid. Sterid. A generic name for the group of compounds comprising the sterols, bile acids, heart poisons, saponins and sex hormones.

sterols. A group of solid alcohols derived from vegetable sources, which consist chiefly of high-atomic *monohydric* unsaturated alcohols. *E.g.*,

farnesol, $C_{15}H_{26}O$.....	acacia
colocynth sterol, $C_{20}H_{34}O$.	colocynth
cucurbitol, $C_{24}H_{40}O_4$.....	watermelon seed
withaniol, $C_{28}H_{36}O_6$.....	*Withania coagulans*
homotaraxasterol, $C_{25}H_{40}O$	dandelion
fongisterol, $C_{28}H_{48}O$.....	ergot
bombicesterol, $C_{26}H_{44}O$...	silkworm chrysalis
isocholesterol, $C_{26}H_{46}O$...	wool fat

ergosterol, $C_{27}H_{42}O.H_2O$.. yeast, animal tissues
cholesterol, $C_{27}H_{46}O$..... animal and plant tissues
stigmasterol, $C_{27}H_{46}O$.... calabar beans
sitosterol, $C_{27}H_{46}O$..... wheat, corn, etc.
phytosterol, $C_{27}H_{46}O$..... many plants
coprosterol, $C_{27}H_{48}O$..... feces
dihydrositosterol, $C_{27}H_{48}O.H_2O$..... wheat
hippocoprosterol, $C_{27}H_{54}O$ horse feces
taraxasterol, $C_{29}H_{48}O$..... dandelion
clutyianol, $C_{29}H_{50}O_5$..... *Clutyia similis*
psylla alcohol, $C_{33}H_{58}O$... psylla wax
asteriasterol..... starfish

They appear to be derivatives of chrysene with a branched unsaturated side-chain. See *cholane*.

sterro metal. An alloy consisting of 56.5 % copper, 40 % zinc, 1.5 % iron and 1 % tin. It is stronger than gun-metal or bronze.

sterule. An ampoule or glass container containing a sterile solution.

Stetefeldt furnace. A furnace for roasting silver and copper ores, and at the same time exposing them to chlorine gas.

stew. To cook in boiling water or other liquid.

Stewart-Kirchhoff law. The light waves emitted by a hot gaseous body can be absorbed by the same substance at a lower temperature. Cf. *Fraunhofer lines*.

stibate. Antimonate.

stibiate. Antimonate.

stibic. Antimonic.

stibiconite. $Sb_2O_3(OH)_2$. Antimony ocher. Stibite. A native hydroxide of antimony.

stibide. Antimonide, stibnide. A binary compound of antimony and another element (hydrogen or a metal).

stibine. (1) Antimonous hydride. (2) An organic compound of the type, SbR_3. **triphenyl-** $Sb(C_6H_5)_3$ = 352.8. Antimony triphenyl. A colorless crystalline powder, m.48. **s. hydroxide.** An organic compound of the type, R_2SbOH.

stibious. Antimonous.

stibite. Stibiconite.

stibium. Antimony.

stibnate. Antimonate.

stibnic. Antimonic.

stibnide. Stibide.

stibnite. Antimony glance.

stibnous. Antimonous.

stibonic acid. An organic compound of the type, R_2SbO_2H.

stibonium. The monovalent radical, SbH_4^+, analogous to ammonium. **s. compounds.** A group of organic compounds derived from stibine and stibonium, of the general type R_4SbX, in which antimony is pentavalent. **s. hydroxide.** A compound of the type, R_4SbOH. **s. iodide.** A compound of the type, R_4SbI.

stibono. The monovalent radical, $(HO)_2OSb$—.

stibophen. Fuadin, fouadin, neoantimosan. Sodium antimony-bispyrocatechol-3,5-sodium disulfonate, $(NaO_3S)_2C_6H_2O_2{:}SbOC_6H_2(ONa)(SO_3Na)_2.7H_2O$. Used in the treatment of trichinosis and trypanosomiasis.

stibosan. $NH_2.C_6H_4.SbO(OH)ONa.5H_2O$. The antimony analogue of atoxyl; used medicinally.

stick. (1) A rod or cylinder; *e.g.*, of dynamite. (2) Gummy or viscous; as, syrup. (3) A thick syrup obtained by evaporation of the water used in making tankage. It contains 1.5–10 % N and is mixed with other fertilizers.

stick lac. See *lac*.

Stieglitz, Julius Oscar. 1867–1937. An American chemist noted for organic research.

stigmastane. $C_{29}H_{48}$ = 396.35. A hydrocarbon derived from stigmastanol.

stigmastanol. $C_{29}H_{48}O$ = 412.3. A hydrogenation product of stigmasterol.

stigmasterol. $C_{29}H_{46}O$ = 410.35. A sterol, m.-170, from calabar beans, soy beans and vegetable oils. Cf. *cholane*.

stilbamidine. 4.4′-diamino stilbene-di-β-hydroxyethane sulfonate. A drug used in the treatment of kala-azar.

stilbene. $C_{14}H_{12}$ = 180.17. Diphenylethylene, toluylene, bibenzal, $Ph.CH{:}CH.Ph$. An unsaturated hydrocarbon. Colorless rhombic leaflets, d.0.970, m.124, b.306; insoluble in water, soluble in alcohol or ether. **diamino-** See *diamino stilbene*. **dibenzoyl-** $C_{28}H_{22}O_2$ = 390.16. Acicular oxylepidine. $(Ph.CH.COPh)_2$. **phenyl-** Triphenylethylene.

s. diol. $C_{14}H_{12}O_2$ = 212.09. Vinylene-bisphenol. $HO.C_6H_4.CH{:}CH.C_6H_4.OH$. **s. hydrate.** $C_{14}H_{14}O$ = 198.2. Toluylene hydrate, $Ph.CHOH.CH_2.Ph$. Colorless crystals, m.62; soluble in alcohol. **ar-** $PhCH{:}CHC_6H_4OH$. Ar-hydroxy stilbene, styryl phenol.

stilbestrol. Diethylstilbestrol (q.v.).

stilbite. $(Na_2,Ca)O.Al_2O_3.6SiO_2.6H_2O$. A native hydrated sodium calcium aluminum silicate of the zeolite group; pearly white prisms.

still. Any apparatus in which a substance is heated to the gaseous state (as, a retort, vaporizer, or evaporator) and the gaseous products condensed (as a condenser or fractionating column). (See *distillation*.) **column-** A s. for fractional distillation. **pot-** A distillation apparatus for whisky or other potable spirits. **vacuum-** A device for distilling at a low temperature, under a reduced pressure obtained by a vacuum pump. **water-** A s. for distilling water.

s. head. Fractionating column. A device for selectively refluxing the less volatile components of mixtures under distillation, thus rendering fractionating more efficient.

stillingia. Queen's root, silver leaf, yaw root. The dried roots of *Stillingia sylvatica*, an Euphorbiaceae of North America. It contains alkaloids; used medicinally, the fluid-extract, as an alterative and expectorant.

stillingine. An alkaloid obtained from stillingia.

stillingoid. The combined principles of the root of stillingia; used medicinally as an alterative.

stilpnomelane. $FeSiO_3$. An iron metasilicate which contains Al, Ca and Mg.

stimmi. Sb_2S_3. A black, native antimony sulfide.

stimulant. An agent that excites or increases a functional activity. Cf. *sedative*.

stinging nettles. Urtica.

stinkstone. Anthraconite.

stinkweed. Stramonium.

stirrer. A device for agitating liquids.

stirring rod. (1) A glass rod bent in various shapes, and mechanically driven by water or an electric motor, for agitating liquids. (2) glass rod used for stirring. Cf. *policeman*.

stizolobin. A globulin from Chinese velvet beans, *Mucuna* (*Stizolobium*) *pruriens*, a Leguminosae.

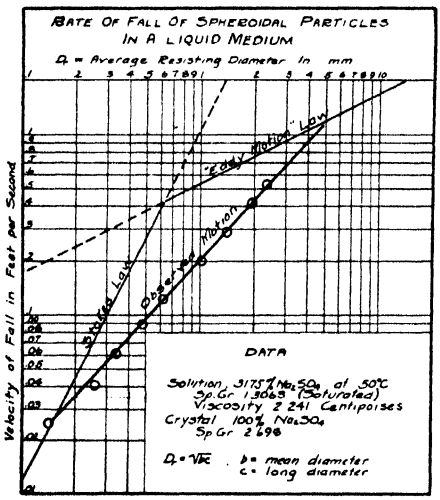
stoechiometry. Stoichiometry.

stoichiometry. A branch of chemistry that deals with the numerical relationship between elements or compounds, (atomic weights), the determination of the proportions in which the

elements combine, (formulae), and the weight-relations in reactions (equations).

stok(e). St. The unit of kinematic viscosity, n, as determined from Stokes' law. It equals dynamic viscosity in poises/density at the same temperature. Viscosity of water at 20°C. = 1.0018.

Stokes, George Gabriel. 1819–1903. An English mathematician noted for laws of hydrodynamics and optics. **S. law.** A mathematical equation that indicates that the rate of fall, v, of a spherical body of radius, a, under gravity, g, is dependent on the viscosity of the medium (η in C.G.S. units): $v = \frac{2ga^2}{9\eta}(\sigma - \rho)$, where σ and ρ are the density of the substance and of the medium respectively. This equation is used in the calculation of the charge on an electron by Millikan's method. For sedimentation (q.v.) the formula is: $v = \frac{gD(\sigma - \rho)}{18\eta}$, where D is the effective diameter of the particle of density σ in a liquid of density ρ. Cf. *settling*.



(from R. B. MacMullin, Double Bond, 9:115, 1937)

	v	v in ft. per sec.	
D mm.	observed	Stokes' law	Eddy law

0.145	0.025	0.023	0.203

stolzite. $PbWO_4$. Native lead tungstate.

stomach. A digestive pouch between the esophagus and the intestines, in which partial digestion of food takes place. **s. contents.** The partly-digested food materials, mixed with salivary and gastric juices; usually examined for free hydrochloric acid, lactic acid, total acidity, ferments and blood. **s. enzyme.** Pepsin. **s. juice** Gastric juice. **s. tube.** A rubber tube, used as a syphon to wash out the stomach or to take samples of s. contents.

stomachic. An agent that stimulates the appetite or increases gastric secretions; as, gentian, cinchona, nux vomica.

stone. (1) A standard British weight, equal to 14 pounds. (2) Concrete mineral matter or pieces of rock. (3) A concretion or calculus, q.v. **blue-** Copper sulfate. **gall-** Calculus. **Lydian-** Jasper. **precious-** Gem. **rotten-** See *rotten s.* **touch-** See *touchstone.*

s. flax. Asbestos. **s. root.** Collinsonoid. **s. ware.** See *ceramics, earthenware, pottery.*

stonecrop. The herb of *Penthorum sedoides*, a Crassulaceae; used as a laxative.

Stoner energy levels. See *S. quanta.* **S. quanta.** A modified Bohr theory, which deals with the distribution of electrons in different energy levels. The quantum number, k, of Bohr is divided into functions, k_1 and k_2, from which a systematic relationship of the lines of x-ray spectra is found. Accordingly there are for:

K	L	M	N	O	P	shells
1	3	5	7	5	3	energy levels

and the respective quantum numbers are:

shell	K	L		M			etc.
Bohr:	1_1	2_1	2_2	3_1	3_2	3_3	etc.
Stoner:	$1_{1(1)}$	$2_{1(1)}$	$2_{2(1)}$ $2_{2(2)}$	$3_{1(1)}$	$3_{2(1)}$ $3_{2(2)}$	$3_{3(2)}$ $3_{3(3)}$	etc.

The numbers denote $n_{k_1(k_2)}$. The electron distribution reduced for the noble gases is shown in the table below. Cf. *Pauli's principle.*

stoneroot. Rich weed, knob weed, horsebalm. The root of *Collinsonia canadensis*, a Labiatae, used as stomachic and diuretic. Cf. *collinsoid.*

stool. The discharge from the bowels; feces, q.v.

stopping power. The capacity of substances to absorb α-particles, as compared with that of air. It is proportional to the atomic number, N: $\sigma = kN^{\frac{4}{3}}$; where k is a constant and σ the stopping power.

storage. (1) The keeping of a chemical in its most suitable container and condition (cf. *hazard*), *e.g.*,

Immersed in a hydrocarbon liquid (oil, kerosene, naphtha)	sodium, potassium, etc.
Immersed in water..	white phosphorus, picric acid
Dry.....	peroxides and hygroscopic chemicals

K $k_2 = 1$	L 1 1 2	M 1 1 2 2 3	N 1 1 2 2 3 3 4	O 1 1 2 2 3	P 1 1 2
He 2					
Ne 2	2 2 4				
A 2	2 2 4	2 2 4			
Kr 2	2 2 4	2 2 4	2 2 4		
Xe 2	2 2 4	2 2 4 4 6	2 2 4	2 2 4	
Rn 2	2 2 4	2 2 4 4 6	2 2 4 4 6 6 8	2 2 4	2 2 4

Cool	volatile and inflammable substances
Ventilated	odoriferous and combustible substances
Isolated	explosives and acids
Dark	light-sensitive substances, dyes
Warm	liquid phenol, phosphoric acid, glacial acetic acid creolin, sodium silicate, formaldehyde.
Tightly covered	Ammonium salts, citric acid, potassium or sodium hydroxide, lead salts, zinc salts

s. battery. An electrical accumulator, q.v. **s. cell.** See *accumulator*. **s. tank.** Gasometer. (2) A large, usually round, iron or concrete structure, used to keep liquids.

storax. Styrax. A semi-liquid balsam from the wood and inner bark of *Liquidambar orientalis*, a Hamamelidiaceae of western Asia. It contains styrol, styracin and cinnamic acid; insoluble in water, slowly soluble in alcohol, soluble in ether. **s. oil.** The volatile oil of s., d.0.890–1.100, b.150–300, containing styrene and cinnamic esters. Cf. *liquidambar*.

storesin. $C_{36}H_{55}(OH)_3$ = 538.46. A hard resin from storax. **alpha-** An amorphous mass, m.160–168. **beta-** A white flocculent mass, m.140–145.

stovaine. $C_{14}H_{21}O_2N$ = 235.19. Benzoyldimethylaminomethylpropanol hydrochloride, $MeCH_2C(PhCOO)Me.CH_2.NMe_2$. The hydrochloride of 2-benzoxy-2-methyl-1-dimethylaminobutane. Small, lustrous scales, m.175, soluble in water; used as a local anesthetic.

stovarsol. Acetarsone.

stove. (1) A heating device in which the flame is covered. (2) To heat a paint or varnish film on metal to convert it into a protective and/or decorative coating; *e.g.*, at 160–260°F.

S.T.P. An abbreviation for standard temperature and pressure (0°C. and 760 mm.). Cf. *N.T.P.*

strain. (1) A deformation resulting from stress. It is the increase in length per unit original length. (2) To filter through a coarse filter, so as to remove large solid particles. **s. theory.** Baeyer's theory. The assumption that the normal lines of force of the valency bonds of a carbon atom run from the center of a tetrahedron to each of the four corners, and make an angle of 109° with each other. The stability of the five- and six-atomic rings is thus explained; also, the instability of aliphatic double bonds, and rings which contain a greater or less number of atoms. Cf. *molecular diagram, porphin ring*.

stramonium. Thornapple leaves, Jamestown or Jimson weed, stinkweed, apple of Peru. The dried leaves of *Datura stramonium*, a solanaceous plant containing various alkaloids; used medicinally as a nerve sedative and antispasmodic. **s. seeds.** The seeds of stramonium, containing atropine, hyosycamine, oil, resin, and proteins; used as a hypnotic and antispasmodic.

strata. Pl. of stratum, q.v. (1) The geological layers of rock on the earth surface. (2) The several layers of the atmosphere. (3) The seams of minerals.

stratification. The formation of layers, as in Liesegang rings, q.v.

stratiform. Describing a form of bacterial growth in a solid culture medium, characterized by liquefaction near the walls of the tube which then proceeds downwards.

stratometer. An instrument by which the hardness of a soil is determined from the distance it sinks in the soil under a given impact.

stratum. A geological layer. See *epoch, strata, geologic era*.

streak. The colored line produced when a mineral is rubbed across unglazed porcelain. **s. test.** The approximate gold-content of an alloy is determined by streaking a fine-grained silica stone, covered with charcoal, with the alloy, and comparing the streak with those produced by alloys of known compositions. The streaks are again compared after treatment with dilute aqua regia. Cf. *touchstone*.

stream-line filtration. Edge filtration. A principle of filtration in which the filter acts in a plane perpendicular to the direction of motion (stream-line) of the liquid. The usual type of s. l. filter consists of a pack of stout paper sheets held together in a press; the filtrate passes between the sheets and emerges through holes running along the length of the pack. Pressure or suction is employed. Cf. *filter press*.

Strecker reaction. The formation of amino acids by the action of ammonia on cyanohydrins.

strengite. The ore $FePO_4.2H_2O$.

streptococcus. A group of round or spherical bacteria arranged in strings or rows. pl. -cocci.

streptolysin. A protein which, when activated by reducing enzymes, hemolyses red blood corpuscles.

streptomycin. An antibiotic substance from certain strains of *Streptomyces griseus*.

streptothricin. An antibiotic substance obtained from *Streptomyces lavendulae*.

stress. The force per unit area that produces or tends to produce deformity of a body. Cf. *strain*.

striate. Striped, provided with lines.

string. A gold-plated quartz thread, 1.5–6μ thick, used for Einthoven galvanometers.

stripped atom. An atom from which one or more electrons have been removed by electrical means; hence, the gaseous ion of an element. Cf. *ionization potential, isosteres, kernel, spectral classification*.

stripping. (1) The removal of light fractions (*e.g.*, of lubricating oil distillates) by distillation with superheated steam. (2) The removal of dyestuffs from textiles by immersion in chemical or bleaching reagents.

stroboscope. Rotoscope. A mercury arc or neon lamp coupled with a periodically-discharging condenser. By regulating the frequency of the flashes (up to 2000 per second) the motion of fast-moving machinery can be observed.

stroboscopic. Pertaining to the stroboscope. **s. illumination.** Examined by the light of the stroboscope. **s. photography.** A moving picture of quick moving objects having rotary, oscillatory or vibratory motion and illuminated by the stroboscope which reduces it to slow motion. Cf. *chronoteine*.

stromatin. A constituent of blood corpuscles, which forms a loose compound with hemoglobin.

Stromeyer, Friedrich. 1786–1835. A German apothecary, discoverer of cadmium (1817).

stromeyerite. $(Ag,Cu)_2S$. A native sulfide of copper and silver.

strontia. Strontium oxide.

strontianite. $SrCO_3$. A native strontium carbonate.

strontium. Sr = 87.63. An alkaline earth metal and element, atomic number 38. It is a crystalline, silver-white metal, d.2.54, m.900, b.1000, slowly soluble in water forming the hydroxide. It occurs in nature as strontianite and celestite, and forms only one series of compounds (valency, two). **s. acetate.** $Sr(C_2H_3O_2)_2.\frac{1}{2}H_2O$ = 214.7. A white crystalline powder, soluble in water; used medicinally as an anthelminthic. **s. arsenite.** $Sr(AsO_2)_2.4H_2O$ = 373.7. A white powder; soluble in water; used as an insecticide. **s. bromate.** $Sr(BrO_3)_2.H_2O$ = 361.5. A colorless, deliquescent, crystalline powder, decomp. 240 soluble in water. **s. bromide.** $SrBr_2$ = 247.5. Colorless needles, $d_{24°}$.4.2, m.630; soluble in water or alcohol. *hydrous-* $SrBr_2.6H_2O$ = 355.6. Colorless hygroscopic crystals, d.2.358, soluble in water or alcohol; used medicinally as a tonic. **s. caffeine sulfonate.** Symphorol **s. s. carbonate.** $SrCO_3$ = 147.6. Native as strontianite. Colorless rhombic crystals, d.3.62, decomp. 1155, insoluble in water, soluble in acids; used as a source of strontium salts. **s. chlorate.** $Sr(ClO_3)_2$ = 254.6. Colorless rhombic or monoclinic crystals, d.3.152; m.290 decomp., soluble in water, alcohol or ether; used in pyrotechnics for red fires. **s. chloride.** $SrCl_2$ = 158.6. A colorless crystalline powder, d.3.054, m.872; soluble in water or alcohol. *hydrous-* $SrCl_2.6H_2O$ = 266.6. Colorless hexagonal needles, d.1.964, m.112, soluble in water or alcohol; used as a reagent and in pyrotechnics. **s. chromate.** $SrCrO_4$ = 202.7. Yellow monoclinic crystals, d.3.895; insoluble in water, soluble in acetic acid or ammonium hydroxide. **s. citrate.** $Sr_3(C_6H_5O_7)_2$ = 640.8. A colorless crystalline powder; soluble in water. **s. dioxide.** S. peroxide. **s. dithionate.** $SrS_2O_6,4H_2O$ = 319.81. Plates, d.2.373, insoluble in alcohol. **s. fluoride.** SrF_2 = 125.6. Colorless cubic or octahedral crystals, d.2.44, m.902, decomp. 1190, insoluble in water, soluble in acids; used as an antiseptic. **s. fluosilicate.** $SrSiF_6.2H_2O$ = 265.72. S. silicofluoride. White monoclinic crystals, d.2.99, very soluble in water. **s. formate.** $Sr(OOCH)_2$ = 177.6. Colorless rhombic crystals, d.2.69, m.71.9, soluble in water. *hydrated-* $Sr(OOCH)_2.2H_2O$ = 213.68. White powder, d.2.695, soluble in water. **s. glycerophosphate.** $SrC_3H_7PO_6.(H_2O)_x$. A white crystalline powder; soluble in water, insoluble in alcohol. **s. hydroxide.** $Sr(OH)_2$ = 121.7. Strontium hydrate. A colorless powder, d.3.625, m.375; slightly soluble in water. *hydrous-* $Sr(OH)_2$, $8H_2O$ = 265.8. Colorless, tetragonal, deliquescent crystals, d.1.396; very slightly soluble in water, soluble in ammonium hydroxide. Used in beet sugar manufacture for crystallization of the sugar from the molasses. **s. hyposulfate.** $SrS_2O_6.4H_2O$ = 319.6. A colorless crystalline powder; soluble in water. **s. hyposulfite.** S. thiosulfate. **s. iodide.** SrI_2 = 341.5. Colorless hygroscopic plates, d.4.549, m.402; slightly soluble in water, soluble in alcohol. *hydrous-* $SrI_2.6H_2O$ = 449.6. Colorless crystals, d.4.415, slightly soluble in water, soluble in alcohol; used medicinally as a KI substitute. **s. lactate.** $Sr(C_3H_5O_3)_2.3H_2O$ = 319.8. A white granular powder, soluble in water or alcohol; used medicinally as a diuretic and antirheumatic. **s. monoxide.** S. oxide. **s. nitrate.** $Sr(NO_3)_2$ = 211.7. Colorless cubic or octahedral crystals, d.2.93, m.645 (decomp.), soluble in water. *hydrous-* $Sr(NO_3)_2.4H_2O$ = 283.7. Colorless triclinic crystals, d.2.249, soluble in water, slightly soluble in alcohol; used in pyrotechnics for red fires, and red signal rockets. **s. nitrite.** $Sr(NO_2)_2$ = 179.8. A white powder; soluble in water. **s. oxalate.** $SrC_2O_4.H_2O$ = 193.7. A white crystalline powder, decomp. by heat, insoluble in water, soluble in acids. Used in pyrotechnics. **s. oxide.** SrO = 103.63. Strontia, s. monoxide. Colorless rhombic crystals or grayish-white porous powder, $d_{15°}$.4.36, m.3000, decomp. by water; used industrially in beet sugar manufacture. **s. peroxide.** SrO_2 = 119.62. A fine, white, odorless and tasteless powder; slightly soluble in water; soluble in acids. Used medicinally as an antiseptic; also as a bleaching agent. *hydrous-* SrO_2, $8H_2O$ = 263.76. White crystals, decomp. at red heat. **s. phosphate.** $Sr_3(PO_4)_2$ = 452.8. A white powder, soluble in acids, insoluble in water; used medicinally as a tonic. *acid-* $SrHPO_4$ = 183.7. Colorless rhombic crystals, d.3.544; insoluble in water or alcohol, soluble in ammonium hydroxide or sodium chloride solutions. **s. platinocyanide.** Platinum strontium cyanide. **s. saccharate.** $C_{12}H_{22}O_{11},2SrO$ = 549.52. An almost insoluble salt by means of which sugar is separated from molasses. The sugar is separated by precipitation of the strontium as carbonate. **s. salicylate.** $Sr(C_7H_5O_3)_2.2H_2O$ = 397.6. A colorless crystalline powder, soluble in water or alcohol; used medicinally. **s. silicofluoride.** $SrSiF_6,2H_2O$ = 265.8. A very soluble solid. **s. sulfate.** $SrSO_4$ = 183.7. Native as celestine. Colorless rhombic crystals, d.3.71, decomp. white heat, insoluble in water, slightly soluble in acids. Used in pyrotechnics. **s. sulfide.** SrS = 119.7. Colorless regular crystals or a light-gray powder, d.3.72; soluble in water or alcohol. Used as a depilatory, and as a constituent of luminous or phosphorescent paints. **s. sulfite.** $SrSO_3$ = 167.7. Colorless crystals, decomp. by heat; insoluble in water, soluble in sulfurous acid. **s. tartrate.** $SrC_4H_4O_6.4H_2O$ = 307.6. A white crystalline powder; slightly soluble in water. **s. thiosulfate.** $SrS_2O_3.5H_2O$ = 289.83. Strontium hyposulfite. Colorless needles, d.2.16, soluble in water, insoluble in alcohol.

strophanthic acid. $C_{23}H_{36}O_8$ = 434.3. A dibasic acid derived from strophanthin, decomp. 270, insoluble in water, soluble in sulfuric acid.

strophanthidin. $C_{23}H_{32}O_6$ = 404.3, or $C_{22}H_{38}O_7$ = 474.29. An aglucone from strophanthus, m.178.

strophanthin. $C_{31}H_{48}O_{12}$ = 612.5. Methylouabain, strophanthum. A mixture of glucosides (strophantidin, strophantobiose methyl ether, etc.) from the ripe seeds of strophanthus. A white or faintly-yellow, extremely poisonous crystalline powder, m.179, soluble in water or alcohol; used medicinally as a heart tonic. **crystallized-** Ouabain. **G-** Ouabain. **K-** The glucosides from *Strophanthus kombe.*

strophanthobiose. $C_{12}H_{22}O_{11}$ = 326.17. A disaccharide obtained by partial hydrolysis of strophanthin. It hydrolyzes to mannose and rhamnose.

strophanthum. Strophanthin.

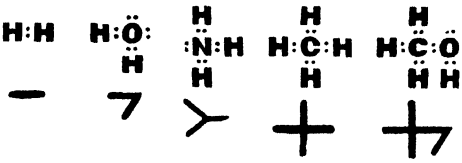
strophanthus. The dried ripe seeds of *Strophanthus Kombe* or other species, an Apocynaceae of Africa and Asia; used medicinally for heart-diseases.

structural. Pertaining to the arrangement of atoms in a molecule. **s. formula.** A representation (on a plane surface) of the atomic arrangement of a molecule.

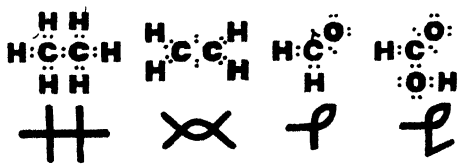
structure. (1) The mode of linkage of atoms in a molecule, especially of an organic compound; it is represented by a graphical formula, a structure symbol, a molecular diagram or molecular model. (2) The constitution of the nucleus, or the arrangement of nuclear particles, q.v. (3) The arrangement of electrons in the atom. **atomic-** Structure (3). Cf. *constellation*. **molecular-** Structure (1). Cf. *atomic distance, molecular models*. **nuclear-** Structure (2). Cf. *isotopes, radioactive elements*.

structure-symbol. A geometrical figure that indicates the arrangement of the atoms in an organic molecule. It represents the valence skeleton of carbon, hydrogen, oxygen and nitrogen of the compound. Each line indicates a bond or a pair of electrons. The terminals or junctions of lines indicate the atoms as follows:

A hydrogen atom at the end of each line,
An oxygen atom at the junction of two lines,
A nitrogen atom at the junction of three or five lines and
A carbon atom at the junction of four lines.
Thus:



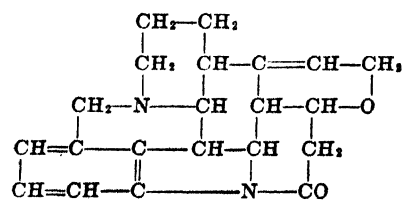
Single, double and triple bonds are shown, respectively, by straight and curved lines as follows:



Atoms of elements, other than the above are represented by their symbols in their respective locations. **electronic-** A s. showing the relative positions of electrons; see *bonds, molecular diagram*.

Strutt, John William. See *Rayleigh*.

strychnine. $C_{21}H_{22}O_2N_2$ = 334.3. Vauqueline. An alkaloid from various species of *Strychnos ignatia* and *S. nux vomica*.



Colorless tetragonal crystals, m.268, slightly soluble in water, soluble in alcohol or ether. Used medicinally in small doses as a tonic and stomachic; also as a rat and pest poison. **dimethoxy-** Brucine. **methyl-** A yellow powder; soluble in water or alcohol.

s. acetate. (Str)$C_2H_4O_2$ = 394.3. Small colorless crystals soluble in water; used medicinally. **s. arsenate.** (Str)H_3AsO_4 = 476.3. A colorless crystalline powder, soluble in water; used medicinally in ampoule medication. **s. arsenite.** (Str)$HAsO_2$ = 442.4. Colorless crystals, slightly soluble in water; used medicinally. **s. bisulfate.** (Str)H_2SO_4 = 432.3. Colorless needles; soluble in water. **s. cacodylate.** (Str)AsO_2Me_2 = 471.3. A white powder; soluble in water. **s. citrate.** (Str)$C_6H_8O_7$ = 497.4. Colorless crystals; soluble in water. **s. glycerophosphate.** (Str)$C_3H_7PO_6$ = 504.3. Colorless crystals, soluble in water; used in ampoule medication. **s. hydrobromide.** (Str)-HBr = 415.3. Colorless needles, soluble in water; used medicinally. **s. hydrochloride.** (Str)$HCl.1\frac{1}{2}H_2O$ = 397.7. Colorless trimetric crystals, soluble in water; used medicinally. **s. iodate.** (Str)HIO_3 = 510.2. Colorless crystals; soluble in water. **s. lactate.** (Str)$C_3H_6O_3$ = 424.4. A white crystalline powder; soluble in water. **s. nitrate.** (Str)HNO_3 = 397.3. Colorless needles, decomp. by heat, soluble in water, alcohol, glycerin or ether. Used medicinally as a tonic and stomachic. **s. phenolsulfonate.** (Str)$PhOHSO_3$ = 508.4. A white crystalline powder; soluble in water or alcohol. **s. phosphate.** (Str)$_2H_3PO_4.9H_2O$ = 928.5. Colorless crystals; soluble in water. **s. salicylate.** (Str)$C_7H_6O_3$ = 472.4. A white crystalline powder; soluble in water or alcohol. **s. sulfate.** (Str)$_2H_2SO_4.5H_2O$ = 856.7. Colorless prisms, anhydrous at 200, soluble in water, alcohol or ether; used medicinally as a tonic and stomachic. **s. valerate.** (Str)-$C_5H_{10}O_2$ = 436.4. A colorless crystalline powder, soluble in water or alcohol; used medicinally as a tonic and sedative.

strychninium. A strychnine containing pentavalent N. Cf. *piperidinium*.

Strychnos. A genus of tropical trees belonging to the Loganiaceae. They yield strychnine, nux vomica, ignatia, curare, akazgine, copalchi, hoangnan, and ipoh.

stucco. A mixture of calcium sulfate, sand, and lime, used as a decorative building material.

Stuffer law. Sulfones, in which two $=SO_2$ groups are on adjacent carbon atoms, will be readily saponified.

stuffing. A dyeing process in which the textiles are first run through the color and afterwards through a mordant. **s. box.** A box containing asbestos or other packing which fits round the point where a moving rod passes through the side of a vessel containing a fluid, and thus prevents leakage.

sturin. $C_{36}H_{68}O_7N_{10}$ = 753.65. A protein from the sperm of the sturgeon.

sturnutatory. Sternutatory.

Stutzer's reagent. A suspension of cupric hydroxide in aqueous glycerol used to separate proteins from other nitrogenous constituents of plants; *i.e.*, "albuminoid" from "amido" nitrogen. The hydroxide is precipitated from a solution of 100 g. copper sulphate crystals in 5 liters of water containing 2.5 cc. glycerol, rubbed in a mortar with water containing 5 cc.

glycerol per liter, washed free of alkali and made into a gelatinous but pipettable mass by rubbing with 10 % aqueous glycerol.

stylophorum. The herb of *Stylophorum diphyllum*, a Papaveraceae. It contains the alkaloids, chelidonine, protopine, sanguinarine and chelerythrine.

styphnic acid. $C_6H_3O_8N_3$ = 245.1. Trinitroresorcinol, 2.4-dihydroxy-1.3.5-trinitrobenzene. A yellow crystalline substance of the picric acid type, d.1.829, m.180; used in explosives.

styptic. An astringent or agent that contracts blood vessels and stops hemorrhage when applied locally; as, alum, tannic acid, ferric chloride, Monsel's solution.

stypticine. $C_{12}H_{15}O_4N.HCl$ = 273.5. Cotarnine hydrochloride. A decomposition-product of narcotine. Yellow crystals, soluble in water or alcohol; used medicinally as a styptic, astringent and hemostatic.

styptol. Cotarnine phthalate. A yellow crystalline powder, soluble in water or alcohol; used as a styptic.

styracine. $C_{18}H_{16}O_2$ = 264.2. Cinnamyl cinnamate. The ester of cinnamic alcohol and cinnamic acid, $PhCH{:}CHCOOCH_2CH{:}CHPh$. It is a solid constituent of liquidambar or styrax, m.44, used in perfumery.

styracol. $C_{16}H_{14}O_2$ = 238.1. Cinnamyl guaiacol, $C_6H_4(OC_9H_7O.CH_3)$. Colorless crystals, soluble in alcohol; used as an antiseptic.

Styrax. (1) A genus of trees and shrubs, Styraceae, that yield balsams; as, storax, benzoin. (2) Storax.

styrene. (1) C_8H_8 = 104.1. Cinnamene, styrolene, phenethylene, styrol, vinylbenzene, phenylethylene, $Ph.CH{:}CH_2$. A constituent of storax, essential oils, and coal tar. A colorless, aromatic liquid, d.0.925, b.145, soluble in alcohol or ether. Used in organic synthesis, and forms two types of derivatives; as, o-, m-, p-aminostyrolene, aminovinylbenzene = $NH_2C_6H_4CH{:}CH_2$. ω-, p-aminostyrolene, phenylvinylamine = $C_6H_5CH{:}CHNH_2$. (2) The bivalent radical, —CHPh.CH_2—.

styrilic acid. Cinnamic alcohol.

styrol. (1) Styrolene. (2) Colloidal silver.

styrolene. Styrene. **s. alcohol.** Cinnamic alcohol.

styron. (1) Cinnamic alcohol. (2) Trade name for a polystyrene plastic. **m-methoxy-p-oxy-** Coniferol.

styryl. The monovalent radical. PhCH:CH— derived from styrolene. **s. alcohol.** Cinnamyl alcohol. **s. amine.** C_8H_9N = 119.1. $PhCH{:}CHNH_2$. A colorless liquid, b.236, insoluble in water, soluble in alcohol. **s. ketone.** $C_{17}H_{14}O$ = 210.1. Dibenzilideneacetone, 1.5-diphenyl-3-pentadienone*, $(Ph.CH{:}CH)_2CO$. Colorless crystals, m.112. **s. methylketone.** Benzilidene acetone.

S.U. Saccharomyces unit, q.v.

sub- A prefix derived from the Latin, and indicating "below," "almost," "under" or "near." It is used to designate a lower form of oxidation or a basic compound, and indicates deficiency of the substance or radical it describes. Cf. *per-*.

subacetate. A basic acetate; as, lead subacetate.

subatomic. Pertaining to the structure of the atoms themselves, as distinct from their function as parts of a molecule. **s. decomposition.** A radioactive disintegration; or other phenomena in which an atom is split or divided. Cf. *radioelement*. **s. particle.** See *particles*. **s. reaction.** A change in which an atom is disintegrated or transformed; as in nuclear chemistry, q.v.

subatomics. A branch of science that investigates the structure of the atoms and the rôle of electrons and nuclei in subatomic changes. Cf. *atomic structure*, *isostere*, *periodic system*, *nuclear reaction*.

subcarbonate. A basic carbonate.

subcutaneous. Located beneath the skin. **s. injection.** The administration of a drug by injecting it under the skin.

subdural injection. The administration of a drug by injecting it into the outermost membrane of the brain or spinal cord.

suber. Cork.

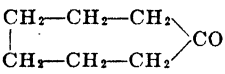
suberane. C_7H_{14} = 98.1. Cycloheptane*, heptamethylene, $(CH_2)_7$. A colorless liquid, m.—13, b.117; soluble in alcohol.

suberic acid. $C_8H_{14}O_4$ = 174.1. Octanedioic acid*, *1.6*-hexanedicarboxylic acid. A dibasic acid and homolog of oxalic acid, $(CH_2)_6(COOH)_2$, obtained by oxidation of cork. Colorless needles, m.140, b.300; soluble in water, alcohol or ether.

suberin. The fat extracted from cork.

suberol. $C_7H_{14}O$ = 114.1. Cycloheptanol*. Colorless liquid, d.0.958, b.185.2.

suberone*. $C_7H_{12}O$ = 112.1. Cycloheptanone, ketoheptamethylene. The heptatomic ring compound,



A colorless oily liquid obtained by distilling calcium suberate, d.0.969, b.180, slightly soluble in water, soluble in alcohol or ether.

suberyl. The monovalent cyclic radical, C_7H_{13}—, derived from suberane. **s. alcohol.** Suberol.

sublamine. $HgSO_4.2C_2H_4(NH_2)_2.2H_2O$ = 452.6. Mercuric sulfate ethylene diamine. A white crystalline powder, soluble in water; used medicinally as a non-irritant germicide.

sublethal. Below fatal; not quite fatal. **s. dose.** The administration of a drug in quantities below the fatal dose.

sublimate. (1) A solid or condensed substance obtained by heating a material; as, the deposit formed on the charcoal block or in a glass tube, after heating certain substances which pass directly from the solid to the vapor phase and then back to the solid state. (2) Mercuric chloride. **corrosive-** Mercuric chloride.

sublimation. The transformation of a solid to a gaseous substance, followed by condensation to the solid state. It differs from distillation in that the solid does not pass through the liquid state. It is used to purify substances such as mercuric chloride, iodine, camphor.

sublime. To successively volatilize and condense a solid.

submicron. A particle between 2×10^{-6} and 5×10^{-7} cm. in diameter ($0.2\mu - 5m\mu$). Cf. *amicron*. They are visible under the ultramicroscope, but not under the ordinary microscope.

subnitrate. A basic nitrate; as, bismuth subnitrate.

subnormal. Below normal.

suboxide. That oxide of an element which contains the lowest proportion of oxygen.

subsoil. The layer below the surface soil. It contains the soluble organic portion of the latter, washed into it by rain.

substance. A particular kind of matter. The material of which a body is composed; as, a chemical compound or a mixture of compounds.

substantive dyeing. The coloring of fabrics without mordants.

substantive dyes. A group of coal tar colors, chiefly for cotton, that impart color directly and without mordanting; as, benzidine dyes, primulin, congodiamine.

substituent. The atom or radical that enters into the structure of a molecule and replaces another atom or radical.

substitute. (1) To replace one element or radical in a compound by another element or radical. (2) Ersatz. A substance used in place of another.

substituted. Pertaining to a compound in which one or more atoms or radicals have been exchanged for one or more others. **s. compound.** A compound obtained by substitution; a derivative, q.v. Cf. *nucleus, group.*

substitution. Describing: (1) A reaction in which an atom or group of atoms in a molecule is exchanged for another atom or group of atoms. A term used mainly in connection with organic compounds. (2) A reaction in which an element or radical is either oxidized or reduced, and a portion of it combines with the displaced element; as

$$MN + 2X = MX + XN$$

SUBSTITUTIONS

alkaline fusion	OH for SO_3H
alkylation	R for H
halogenation	X for H
nitration	NO_2 for H
reduction	NH_2 for NO_2
sulfonation	SO_3H for H

substitutive derivate. A compound formed by the replacement of one atom or radical by another atom or radical; as, $C_6H_6 \rightarrow C_6H_5Cl$. It differs from an additive derivative in that in the latter one or more atoms are added to the molecule; as, $C_6H_6 \rightarrow C_6H_6Cl_2$.

substrate. The material upon which an enzyme or ferment acts; the substance acted upon.

subsubmicron. Amicron.

subsulfate. A basic sulfate.

subtilin. An antibiotic substance produced by *Bacillus subtilis*, a bacterium.

subultramicroscopic. Matter in such a high degree of dispersion as to be invisible in the ultramicroscope. Cf. *amicron.*

succinaldehyde. $C_2H_4(CHO)_2$ = 86.07. Butanedial*. Five forms:

α—liquid b.169.	δ—solid, m.135.
β—liquid, b.171.	ϵ—solid, m.95 (decomp.)
γ—solid, m.64.	

methyl- Pyrotartaraldehyde.

succinamic acid. $C_4H_7O_3N$ = 117.1. Amidosuccinic acid, β-carbamylpropionic acid, $COOH.CH_2.CH_2CONH_2$. A white, colorless powder; soluble in water. **amino-** Asparagine.

succinamide. $C_4H_8O_2N_2$ = 116.1. Diamidosuccinic acid, butanediamide*, $(NH_2COCH_2)_2$. Colorless needles, m.242 (decomp.), soluble in water, insoluble in alcohol or ether. **hydroxy-** Malamide. **phenetyl-** Pyrantin.

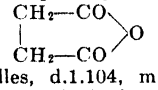
succinamyl. The monovalent radical, $—OC(CH_2)_2CONH_2$.

succinate. A salt of succinic acid of the type $C_2H_4(COOM)_2$.

succinelite. Succinic acid obtained from amber.

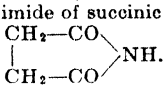
succinic acid. $C_4H_6O_4$ = 118.1. Ethylene dicarboxylic acid, amber acid, butanedioic acid*. A bibasic acid and homolog of oxalic acid, $HOOC.CH_2.CH_2.COOH$. It occurs in amber and various other resins as colorless monoclinic prisms, d.1.554, m.184, b.235, slightly soluble in water, alcohol or ether; used as a reagent. **iso-** $CH_3.CH:(COOH)_2$. A solid, d.1.455, m.130, (decomp.), soluble in alcohol or ether, insoluble in water. **α-amino-** Aspartic acid. **diamido-** Succinamide. **dihydroxy-** Tartaric acid. **ethyl-** See *ethyl-succinic acid.* **formyl-** Aconic acid. **hydroxy-** Malic acid. **keto-** Oxalacetic acid. **methyl-** Pyrotartaric acid. **methylene-** Itaconic acid.

s. aldehyde. Succinaldehyde. **s. anhydride.** $C_4H_4O_3$ = 100.1. Succinyl oxide, butanedioic anhydride*. The pentacyclic compound,



Colorless needles, d.1.104, m.120, b.261; insoluble in water, soluble in alcohol or ether. **s. peroxide.** $C_8H_{10}O_8$ = 234.2. Alphozon, alphogen. $(HOOC.CH_2.CH_2.CO)_2O_2$. A white fluffy powder, soluble in water; used as germicide and mouthwash.

succinimide. $C_4H_5O_2N.H_2O$ = 117.1. Butaneimide*. The imide of succinic acid,



Colorless octahedral crystals m.124, b.287; soluble in water, alcohol or ether.

succinite. (1) An amber-colored grossularite or aluminum garnet, q.v. (2) Baltic amber; it contains 4 % of succinic acid.

succinol. An oil obtained by distilling amber.

succinonitrile. Ethylene cyanide.

succinoresinol. $C_{12}H_{20}O$ = 180.2. An alcohol from amber.

succinyl. Butanedioyl*. The bivalent radical, $—OC.CH_2CH_2.CO—$, derived from succinic acid. **s. chloride.** $(CH_2COCl)_2$ = 154.97. Succinyl dichloride, butanedioyl chloride*, $C_2H_4(COCl)_2$. A colorless, fuming, highly refractive liquid, d.1.412, m.16, b.190; used in organic synthesis. **s. oxide.** Succinic anhydride.

succinylsulfathiazole. $C_{13}H_{13}N_3O_5S_2$ = 373.39. Sulfasuxidine. Sulfathiazole in which a hydrogen of the NH_2 group is replaced by the succinyl radical. It is employed in treating intestinal infections.

sucramine. The ammonium salt of saccharin.

sucrase. Invertase.

sucrate. A compound of sucrose.

sucroclastic. Describing a glycolytic enzyme.

sucrol. $C_9H_{12}O_2N_2$ = 180.2. Dulcin, p-phentylurea, valzin, *p*-ethoxyphenylurea, *p*-phenetolcarbamide, $NH_2.CO.NH.C_6H_4.OEt$. Colorless lustrous needles, m.173; slightly soluble in water, soluble in alcohol or ether. It is 200 times as sweet as cane sugar, and is used for sweetening.

sucrolite. A synthetic resin plastic of the formaldehyde-urea type, in which most or all of the former is replaced by sugar or molasses; some are transparent.

sucrose. $C_{12}H_{22}O_{11}$ = 342.2. Cane sugar, saccharobiose, beet sugar, saccharose. A di-

saccharide, hydrolyzing to fructose and glucose, $[\alpha]_D^{20} + 66.5°$. Colorless monoclinic crystals, d.1.588, m.160 (decomp.), soluble in water, slightly soluble in alcohol. Cf. *sugar refining*. Used extensively as a food, for preserves, jams, confectionery, beverages and for sweetening; also in explosives. **s. octaacetate.** A white powder, m.69–72, having a very bitter taste; used as denaturant for rubbing alcohol (4.25 lb. added to 100 gallons).

suction. The act of sucking. Drawing a fluid into a pipe. **s. gas.** The coal gas contained in producer-gas when coal is used in place of coke. **s. pump.** See *pump*.

sucuuba bark. Plumiera.

sudan. s. I. Sudan yellow. **s. II.** Xylidine azo-β-naphthol. A brown dye. **s. III.** Sudan red. **s. IV.** Scarlet Red. **s. brown.** A fat-soluble diazo-dye, soluble in alcohol. **s. red.** $C_{22}H_{16}ON_4$ = 352.3. Aminoazobenzeneazo-β-naphthol, sudan III. $Ph.N_2C_6H_4.N_2C_{10}H_6OH$. A brown powder, insoluble in water, soluble in alcohol or ether; used as a microscope stain and for coloring fats. **s. yellow.** $C_{12}H_{10}O_2N_2$ = 214.2. Aniline azo-β-naphthol, sudan I. A red powder, insoluble in water, soluble in alcohol or fats; used to color oils and varnishes.

sudanite rock. A mixture of talc and magnesite.

sudonific. A diaphoretic, or an agent that causes the production of sweat.

suet. Tallow. (1) Pharmaceutically: The fat from the abdominal cavity of sheep; it contains chiefly stearates and palmitates, with some oleates of glycerol. A colorless unctuous mass, m.45–50, soluble in alcohol or ether. Used in the preparation of ointments and cerates; and in cooking. (2) Culinarily: The fat from beef. (3) Industrially: The solid fat from any animal.

suffocating gases. A group of poison gases (q.v.) used in warfare, that stop respiration; as, Cl_2 or $COCl_2$.

sugar. (1) A carbohydrate having a sweet taste; general formula, $(C_nH_{2n}O_n)$ or $C_nH_{2n-2}O_{n-1}$, cf. *carbohydrates*, *monosaccharides*, *furanoside*, *pyranoside*, *sweetness*. See table. (2) Generally sucrose. **acorn-** Quercitol. **avocado-** A mannoketoheptose isolated from the avocado or alligator pear. **beechwood-** Xylose. **beet-** A sucrose from the sugar beet, *Beta vulgaris*. **blood-** Glucose. **brain-** Cerebrose. **cabbage-** A triose from cabbage leaves. **cane-** A sucrose from sugar cane, *Saccharum officinalis*. **collagen-** Glycocoll. **corn-** Glucose. **diabetic-** A misnomer for saccharin. **fruit-** Fructose. **gelatin-** Glycocoll. **grape-** Glucose. **gum-** Arabinose. **heart-** Inositol. **invert-** See *invert-sugar*. **larch-** Melezitose. **liver-** Glycogen. **malt-** Maltose. **maple-** A crude s., chiefly sucrose, of agreeable flavor made from the sap of certain maples (*Acer saccharum, A. nigrum*, etc.) native in Eastern Canada and the North-Eastern United States. **meat-** Inositol. **milk-** Lactose. **muscle-** Inositol. **palm-** A sucrose from the toddy palm, *Caryota urens;* or the cocoanut palm, *Cocos nucifera*. Cf. *jaggery*. **priming-** See *priming sugar*. **reducing-** A s. that will reduce Fehling's solution at the boiling point. This is indicative of free aldehyde or keto groups which are not in glucoside combination with other molecules. **sorghum-** A sucrose from sugar millet, *Sorghum saccharatum*. **stone-crop-** A heptose in *Sedum spectabile*. **wood-** Xylose. **yeast-** A sulfur-containing sugar, found in small traces in yeast.

s. cane. *Saccharum officinarum*, the source of cane sugar. **s. carbonate.** A carbonic ester of sugars. **s. of lead.** Lead acetate. **s. refining.** The purification of beet or cane sugar by removal of vegetable proteins and salts, followed by decolorization and crystallization of pure sucrose. World output in the season 1940/1:

beet sugar: 10,500,000 long tons, by Russia > Austria + Germany > U. S. A. > Italy > U. K. > France, as leading producers;

cane sugar: 17,100,000 long tons, from India > Cuba > U. S. A. > Formosa > Hawaii > Porto Rico > Brazil > Australia, as leading growers of raw sugar.

suint. A greasy substance derived from dry perspiration from the wool of sheep; it consists of potassium salts of organic acids. **s. ash.** Potassium black. A source of potassium salts and fertilizer.

sulf-, sulph- A prefix indicating the presence of sulfur. (See *thio-*.)

sulfa drugs. A family of drugs of the sulfonamide type which are effective in combating certain bacterial infections; individual members of the family differ widely in their efficacy toward a particular disease. The more important of these drugs are: sulfadiazine, sulfaguanidine, sulfamerazine, sulfanilamide, sulfapyridine, sulfathiazole, succinylsulfathiazole.

sulfacetimide. Albucid, sulamyd. The *p*-aminobenzene-sulfonacetamide, $NH_2.C_6H_4.SO_2.NH.CH_3CO$. It is employed in treating urinary infections and meningitis.

sulfacid. (1) A thioacid. (2) A sulfonic acid.

sulfactol. Sodium thiosulfate used in sulfur therapy.

sulfadiazine. $C_{10}H_{10}N_4O_2S$ = 250.27. 2-Sulfanilamidopyrimidine, *p*-amino-N-2-pyrimidylbenzenesulfonamide, $NH_2.C_6H_4.SO_2.NH.C_4H_3N_2$. Used in treating various bacterial infections. **s. sodium.** The sodium derivative of sulfadiazine.

sulfaguanidine. $C_7H_{10}O_2N_4S.H_2O$ = 232.24. Sulfanilylguanidine monohydrate; the *p*-aminobenzenesulfonylguanidine monohydrate, $NH_2.C_6H_4.SO_2.N:C(NH_2)_2.H_2O$. It is valuable in the treatment of various intestinal infections, being poorly absorbed from the gastrointestinal tract.

sulfaldehyde. C_2H_6S = 74.1. Thioaldehyde, thioacetaldehyde, Me.CS.H. An oily liquid, used medicinally as a hypnotic.

sulfamerazine. 2-Sulfanilamido-4-methylpyrimidine, the 4-methyl derivative of sulfadiazine (q.v.). It is more soluble in water and more rapidly absorbed than sulfadiazine.

sulfamethazine. Sulfamezathine. 2-Sulfanilamido-4,6-dimethylpyrimidine, a dimethyl derivative of sulfadiazine or monomethyl derivative of sulfamerazine. It is slightly more rapid in action than sulfamerazine.

sulfamic. The trivalent radical, $=N.SO_2-$. **s. acid.** Sulphonamic acid, sulfamidic acid. An organic acid of the general type, $R_2N.SO_2.OH$.

sulfamide. $SO_2(NH_2)_2$ = 96.18. The diamide of sulfuric acid. A solid, soluble in water or alcohol, m.92, decomp. 250. Cf. *sulfaminic acid*. **alkyl-** An organic compound of the type, $R_2N.SO_2.NR_2$.

sulfamidic acid. Sulfamic acid.

sulfamidobarbituric acid. Thionuric acid.

sulfamine. Sulfonamide. The monovalent radical, $—SO_2NH_2$. Cf. *sulfa drugs*.

SUGARS

1. Monosaccharides

$[\alpha]_D^{20}$		
1a. TETROSES		$C_4H_8O_4$
	erythrose, threose	from pentoses
1b. PENTOSES		$C_5H_{10}O_5$
−105.0*m*	arabinose	from gum arabic, cherry gum, beet roots.
18.8	ribose	from nucleic acids
48.78	cyclose	
	xylose	from wood, corn cobs, straw, jute, etc.
	lyxose	from xylonic acids
1c. METHYLPENTOSES		$C_6H_{12}O_5$
−77	fucose	from seaweeds
−71.7	styracitol	
19.5	rhamnose	from glucosides (quercitrin)
74.5	rhodeose	
1d. HEXOSES		$C_6H_{12}O_6$
A. Aldoses:		
14.36	mannose	from orange peels, Brazil nuts, glucosides, etc.
19.8	cocaose	from coca nut
52.50*m*	glucose (dextrose)	from sweet fruits, honey, etc.
80.8	galactose	from galactans, lactose, glucosides
	gulose	from oxidation and reduction of glucose
B. Ketoses:		
−90.9	fructose (levulose)	from sweet fruits
42.9	sorbose	from mountain ash
1e. METHYLHEXOSES		$C_7H_{14}O_6$
−61.4*m*	rhamnohexose	
1f. HEPTOSES		$C_7H_{14}O_7$
−25*m*	α-glucoheptose	
−12.2	β-glucoheptose	
−54.5	β-galaheptose	
29.37	perseulose	
68.64	mannoheptose	
1g. METHYLHEPTOSES		$C_8H_{16}O_7$
8.4	rhamnoheptose	
1h. OCTOSES		$C_8H_{16}O_8$
	$\alpha\alpha$-gluco-octose	
−93	$\alpha\alpha$-gluco-octose (α-form)	
−28	$\alpha\alpha$-gluco-octose (β-form)

123	raffinose *abc n*	from sugar beet, cottonseed cake, manna, etc.
	procellose *aaa*	from cellulose.

4. Tetrasaccharides

4a. (4 hexoses)..... $C_{24}H_{42}O_{21}$

148 stachyose *abbc n*..... from the root of Stachys tuberifera.

$[\alpha]_D^{20}$ All figures without minus sign are dextro-rotatory.

m indicates mutarotation of freshly prepared solutions.

r indicates reduction of Fehling's solution.

n indicates non-reduction of Fehling's solution.

The products of hydrolysis are indicated by: *a* = d-glucose, *b* = d-galactose, *c* = d-fructose. *d* = rhamnose.

sulfaminic acid. $NH_2.SO_2OH$ = 97.10. Amidosulfonic acid. The monoamide of sulfuric acid (cf. *sulfamide*). Colorless crystals, soluble in water. **alkyl-** An organic compound of the type, $R_2N.SO_2.OR$.

sulfamino. The monovalent radical, HO_3SNH— or —$NHSO_2.OH$; derived from sulfaminic acid.

sulfaminobenzoic acid. $C_7H_7O_4NS$ = 201.2. o-Sulfaminebenzoic acid, $NH_2SO_2.C_6H_4.COOH$. Colorless rhombohedral crystals, m.165, soluble in water, alcohol or ether; used in organic synthesis.

sulfamyl. The monovalent radical, NH_2SO_2—

sulfanilamide. $C_6H_8N_2O_2S$ = 172.20. Sulfamidyl, prontylin, prontosil-album, streptozone, streptocide, stramid, lysococcine. The *p*-aminobenzenesulfonamide, $NH_2.C_6H_4.SO_2.NH_2$. It is effective as an antibacterial in many diseases.

sulfanilate. A salt of sulfanilic acid.

sulfanilic acid. $C_6H_7O_3NS$ = 173.17. Sulphanilic acid, *p*-aniline sulfonic acid, p-aminobenzenesulfonic acid, $NH_2.C_6H_4.SO_3H$. Colorless, efflorescent, rhombic crystals, decomp. 280; soluble in water, alcohol or ether. Used as a reagent (Ehrlich's diazo reaction), for detecting nitrous acid and bile pigments, in microscopy, in organic synthesis, and in the manufacture of azo dyes.

sulfantimonate. A salt of the general type, M_3SbS_4, obtained by dissolving antimonic sulfide in ammonium sulfide. **sodium-** *Schlippe's salt.*

sulfantimonide. A double salt of sulfide and antimonide; as CuS_2Sb = CuS.SbS.

sulfantimonite. A salt of the general type, M_3SbS_3, obtained by dissolving antimonous sulfide in ammonium sulfide.

sulfapyridine. $C_{11}H_{11}N_3O_2S$ = 249.28. Dagenan, eubasin, coccoclase, pyriamid, M & B 693. The 2-sulfanilyl-aminopyridine or 2-*p*-aminobenzene-sulfonamido-pyridine, $NH_2.C_6H_4.SO_2.NHC_5H_4N$. It is especially useful in the treatment of pneumonia. **s. sodium.** The sodium derivative of sulfapyridine.

sulfarsenate. A salt of the general type, M_3AsS_4, derived from the hypothetical sulfarsenic acid, H_3AsS_4.

sulfarsenide. A double salt of sulfide and arsenide; as, $FeAsS_2$.

sulfarsenite. A salt of the general type, M_3AsS_3, derived from the hypothetical sulfarsenous acid, H_3AsS_3.

sulfarsphenamine. A compound similar to arsphenamine; less irritating but less efficient therapeutically.

sulfasuxidine. Succinylsulfathiazole (q.v.).

sulfate. A salt of sulfuric acid of the general type, M_2SO_4. **acid-** A salt of the type, $MHSO_4$; as, $NaHSO_4$. **basic-** Subsulfate, or a salt of the type, $M(OH)SO_4$. **bi-** Acid. **hydrogen-** Acids. **hypo-** A salt of the type $M_2S_2O_6$, dithionate. **neutral-** Sulfate. **normal-** Sulfate. **pyro-** A salt of the type, $M_2S_2O_7$. **thio-** A salt of the type, $M_2S_2O_3$, thionate.

s. ion. The divalent anion, SO_4^{--}. **s. of lime.** Calcium sulfate. **s. of potash.** Potassium sulfate. **s. pulp.** Paper pulp obtained by digestion of wood in a solution of sodium sulphide containing some sodium hydroxide, sulphate, and carbonate.

sulfathiazole. $C_9H_9N_3O_2S_2$ = 255.31. The 2-sulfanilyl-aminothiazole, $NH_2.C_6H_4.SO_2.NHC_3H_2SN$. Especially useful in the treatment of pneumonia and for local application in certain types of wounds. **s. sodium.** The sodium derivative of sulfathiazole.

sulfatide. One of a class of lipoid substances containing sulfuric acid esters.

sulfatostannate. An organic compound of the type, $R_2H_2Sn(SO_4)_3$. Cf. *sulfostannate.*

sulfazide. An organic compound of the type, R—NH.NH.SO_2—R.

sulfhydrate. Hydrosulfide.

sulfhydryl. Mercapto. The monovalent radical, —SH.

sulfidal. Colloidal sulfur.

sulfide. A binary compound of divalent sulfur; as, M_2S or, R_2S, where M is a monovalent metal or R a monovalent organic radical. The latter are named like the ethers, *thio-** replacing *oxy-**, as methylthioethane*, MeSEt. **alkyl-** Thioethers. Compounds of the type, R—S—R. **di-** Compounds of the type, M_2S_2, or, R_2S_2. **s. dyes.** A dye that is used in a sodium sulfide bath. **s. ion.** The divalent ion, S^{--}. **s. sulfur.** The divalent, negative, sulfur atom in sulfides, as distinguished from tetra- or hexavalent, positive sulfur.

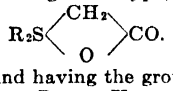
sulfidion. See *sulfide ion.*

sulfime. A compound having a =C:N.S— group; as R.CH(:NSH). Cf. *oxime.*

sulfilimine. A compound of the general type, R_2S:NH.

sulfimide. (1) A compound containing the divalent —SO_2.NH— radical. (2) $(SO_2NH)_3$ = 239.7. An imide of sulfuric acid.

sulfinate. (1) Thetines. A group of organic compounds of the general type,



(2) A compound having the grouping

(3) A salt of sulfinic acid,

sulfindigotic acid. $C_8H_5NOSO_3$ = 211.11. A compound obtained by the action of sulfuric acid on indigo. (Cf. *thioindigo.*)

sulfine. Sulfonium compound. An organic compound of the type, R_3SX (see *sulfonium*).

sulfinic acid. An organic compound of the type, R—SO.OH; as, ethanesulfinic acid*, $EtSO_2H$; naphthalenedisulfinic acid*, $C_{10}H_6(SO_2H)_2$. In derivatives it becomes the prefix sulfino-*.

sulfinid. Saccharin.

sulfino*. The monovalent radical, —SO_2H. Cf. *sulfinic acid.*

sulfinoxide. An organic compound of the type, $R_2S.OH$.

sulfinyl. The divalent radical, =SO.

sulfion. Sulfide ion, S^{--}.

sulfite. Any salt of sulfurous acid of the general type, M_2SO_3. **acid-** A salt of the type, $MHSO_3$. **bi-** Acid sulfite. **hydrogen-** Acid-. **hypo-** (1) A salt of the type $M_2S_2O_4$. (2) Thiosulfate. **sub-** Thiosulfate.

s. ion. The divalent anion, SO_3^{--}. **s. cellulose liquor.** The waste liquor obtained after the pulping of wood by the sulfite process. It contains 2–4 % free SO_2, 2–7 % SO_3^{--}, 2–5 % SO_4^{--}, 80–90 % solids and 12–16 % ash, with calcium compounds, carbohydrates and lignone sulfonate. It is used as a tanning, binding, or mordanting agent, or for fermentation. **s.c.l. lactone.** Tsugaresinol. **s. pulp.** A paper pulp obtained by the digestion of wood (generally coniferous wood) with calcium bisulfite containing free SO_2.

sulfo- sulpho- A prefix, generally indicating the presence of (1) divalent sulfur, or (2) the sulfo-group, $—SO_3H$. Cf. *thio-*. **s. acid.** Sulfonic acid. **s. group.** The monovalent $—SO_3H$ group. (See *sulfonic acids.*) **s. salt.** (1) A salt of an acid containing sulfur. (2) An ester of sulfonic acid.

sulfoacetic acid. $C_2H_4O_5S$ = 140.10. $HSO_3.CH_2.COOH,H_2O$. Colorless tablets, m.86, subliming on further heating, soluble in water, alcohol or ether.

sulfoarsenide. Sulfarsenide.

sulfobenzide. $C_{12}H_{10}O_2S$ = 218.2. Diphenylsulfone, Ph_2SO_2. Colorless scales, m.123; insoluble in water, slightly soluble in alcohol or ether.

sulfobenzoic acid. $C_7H_6O_5S$ = 202.12. $HSO_3.C_6H_4.COOH$. **ortho-** Colorless triclinic crystals, m.134, forming an anhydride when heated above 125°C; soluble in water or alcohol. **meta-** Colorless crystals, m.141; soluble in water or ether. **para-** Colorless needles, m.260, soluble in water, alcohol or ether; used in organic synthesis. Cf. *halazone.*

sulfocarbamide. Thiourea.

sulfocarbanilide. $C_{13}H_{12}N_2S$ = 228.24. Thiocarbanilide, diphenylsulfourea, diphenylthiourea, Ph.NH.CS.NH.Ph. Colorless crystalline leaflets, d.1.303, m.153, insoluble in water, soluble in alcohol or ether; used in organic synthesis.

sulfocarbazide. A compound containing the divalent —NH.NH.CS.NH.NH— radical.

sulfocarbimide. Isothiocyanic acid.

sulfocarbodiazone. A compound containing the divalent —N:N.CS.N:N— radical.

sulfocarbolate. Phenol sulfonate. A salt of phenolsulfonic acid.

sulfocarbolic acid. Phenolsulfonic acid.

sulfocarbonate. Any salt of the general type, M_2CS_3, derived from sulfocarbonic acid.

sulfocarbonic acid. H_2CS_3 = 110.2. Thiocarbonic acid, trithiocarbonic acid. A brown oil, insoluble in water and readily decomposed. Its potassium salt is a reagent for nickel.

sulfochloride. The chloride of sulfonic acids of the general type $R.SO_2.Cl$.

sulfocyan. Thiocyanate.

sulfocyanate. Thiocyanate.

sulfocyanic acid. Thiocyanic acid.

sulfocyanide. Thiocyanate.

sulfoform. $C_{18}H_{15}SbS$ = 384.8. Triphenylstibine sulfide, Ph_3SbS. Colorless needles, m.120, used in skin diseases. *crude-* A yellow liquid; a powerful reducing agent. It reduces sulfuric acid to sulfurous acid, and antimonic oxide to antimonous oxide.

sulfo-group. The monovalent $—SO_3H$ group (see *sulfonic acid*).

sulfoguaiacin. Quinine methyl sulfoguaiacate.

sulfohydrate. Hydrosulfide.

sulfoichthyolic acid. One of a number of compounds obtained from bituminous shales, which contain sulfur as sulfonate, sulfone or sulfide.

sulfoid. Colloidal sulfur.

sulfoleate. A salt of sulfoleic acid.

sulfoleic acid. A compound obtained by mixing sulfuric acid with oils containing oleic acid.

sulfolipins. Fatty substances containing sulfur.

sulfonal. $C_7H_{16}O_4S_2$ = 228.3. Sulphonal, sulfonmethane, diethylsulfone-dimethylmethane, $Me_2C(SO_2Et)_2$. Colorless prisms, m.126 decomp. 300, slightly soluble in water, soluble in alcohol or ether; used medicinally as a hypnotic. **methyl-** Trional.

sulfonamic. Sulfamic.

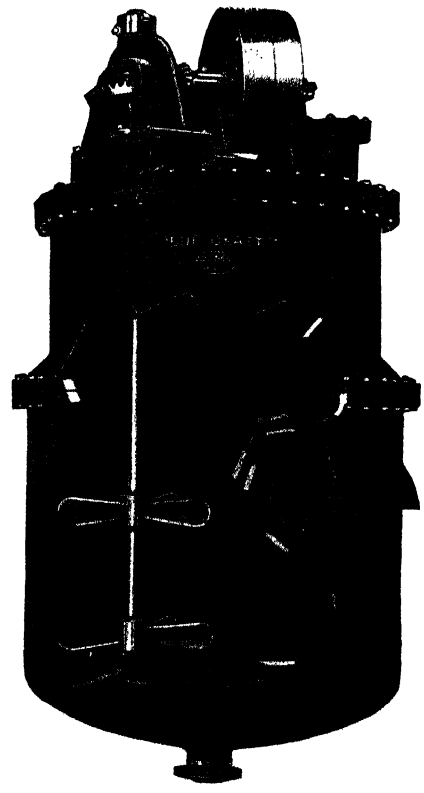
sulfonamide. Sulfamine.

sulfonamido. The bivalent radical, $—NH.SO_2—$. Cf. *sulfamino, sulfamyl.*

sulfonaphthol. $C_{10}H_8O_4S$ = 224.13. $HSO_3.C_{10}H_6.OH$. A colorless powder; used medicinally as an antiseptic, also in organic synthesis.

sulfonate. (1) To treat an aromatic hydrocarbon with fuming sulfuric acid. (2) A sulfuric acid derivative. (3) The ester of a sulfonic acid.

sulfonation. The substitution of one or more H by one or more $—SO_3H$ groups. **direct-** The treatment of an organic compound with fuming



Sulfonator.

sulfuric acid. **indirect-** Treatment with acid sulfites or other salts.

sulfonator. A double-walled cast iron vessel with power-driven stirring device; used for large-scale sulfonation. See illustration.

sulfone. An organic compound of the type, R_2SO_2, or, RSOOR, obtained by oxidation of sulfides. In derivatives its prefix is sulfonyl*; as ethyl sulfone*, Et_2SO_2; methylsulfonyl ethane* $EtSO_2Me$. **s. methanes.** A group of compounds used medicinally to produce sleep:

sulfonal, diethylsulfonedimethylmethane, $Me_2C(SO_2Et)_2$.

trional, diethylsulfonemethylethylmethane, $MeEtC(SO_2Et)_2$.

tetronal, diethylsulfonediethylmethane, $Et_2C(SO_2Et)_2$.

s. phthalein. See *sulfonphthalein.*

sulfonethylmethane. Trional.

sulfonic acid*. An organic compound containing the monovalent —SO_3OH or —SO_3H radical. They are derived from sulfuric acid by the replacement of an —OH group; usually obtained by treatment of aromatic hydrocarbons with conc. sulfuric acid. They are soluble in water, and yield phenols when heated with solid KOH. Many sulfonic acids are used in organic synthesis, and in the manufacture of dyes and synthetic drugs. The more common dyestuff intermediates and their trade names are:

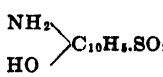
Monosulfonic acids

$HO.C_{10}H_6.SO_2OH$

1-naphthol-4-sulfonic acid.... NW acid
1-naphthol-5-sulfonic acid.... L acid
2-naphthol-6-sulfonic acid.... Schäffer's acid
2-naphthol-7-sulfonic acid.... F acid
2-naphthol-8-sulfonic acid.... Bayer's acid

$NH_2.C_{10}H_6.SO_2OH$

1-naphthylamine-2-sulfonic acid..... o-naphthionic
1-naphthylamine-3-sulfonic acid..... Cleve's acid
1-naphthylamine-4-sulfonic acid..... naphthionic acid
1-naphthylamine-5-sulfonic acid..... Laurent's acid
1-naphthylamine-6-sulfonic acid..... Cleve's acid
1-naphthylamine-8-sulfonic acid..... peri acid
2-naphthylamine-1-sulfonic acid..... Tobias acid
2-naphthylamine-5-sulfonic acid..... Dahl's acid
2-naphthylamine-6-sulfonic acid..... Brönner's acid
2-naphthylamine-8-sulfonic acid..... Badische acid



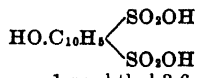
$C_{10}H_5.SO_3OH$

1-amino-5-naphthol-7-sulfonic acid.. M acid
1-amino-8-naphthol-4-sulfonic acid.. S acid
1-amino-8-naphthol-6-sulfonic acid.. γ acid
2-amino-5-naphthol-7-sulfonic acid.. J acid

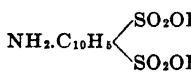
Disulfonic acids

$C_{10}H_6(SO_2OH)$

naphthalene-1.5-disulfonic acid..... Armstrong's acid
naphthalene-1.6-disulfonic acid..... Ewer & Pick's acid
naphthalene-2.5-disulfonic acid..... Ebert & Merz's acid



1-naphthol-3.6-disulfonic acid.. RG acid
1-naphthol-3.8-disulfonic acid.. Andresen's acid
1-naphthol-4.8-disulfonic acid.. δ acid
2-naphthol-3.6-disulfonic acid.. R acid
2-naphthol-6.8-disulfonic acid.. G acid



1-naphthylamine-2.7-disulfonic acid..... Kalle's acid
1-naphthylamine-3.6-disulfonic acid..... Freund's acid
1-naphthylamine-3.8-disulfonic acid..... ε acid
1-naphthylamine-4.6-disulfonic acid..... Dahl II acid
1-naphthylamine-4.7-disulfonic acid..... Dahl III acid
1-naphthylamine-4.8-disulfonic acid..... Disulfo acid

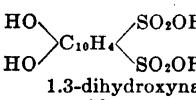
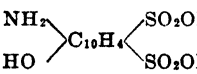
2-naphthylamine-6.8-disulfonic acid..... amino G acid



1.3-dihydroxynaphthalene-5.7-disulfonic acid..... yellow acid
1.5-dihydroxynaphthalene-3.7-disulfonic acid..... red acid
1.7-dihydroxynaphthalene-3.6-disulfonic acid..... A acid
1.8-dihydroxynaphthalene-3.6-disulfonic acid..... chromotropic acid



1-amino-8-naphthol-2.4-disulfonic acid..... 2 S acid
1-amino-8-naphthol-3.6-disulfonic acid..... H acid
1-amino-8-naphthol-4.6-disulfonic acid..... K acid
2-amino-8-naphthol-3.6-disulfonic acid..... 2R acid

Trisulfonic acids

$NH_2.C_{10}H_4(SO_2OH)_3$

1-naphthylamine-3.6.8-trisulfonic acid..... Koch's acid

amino- Sulfamic acid. **diamino-** Sulfamide. **nitro-** Nitrosylsulfate.

sulfonium. Sulfine. The monovalent, electropositive radical, R_3S—. **s. compound.** Sulfine. An organic compound of the type, R_3SX, in which R is an organic radical, and X

an electronegative element (Br, Cl, I) or radical (OH). **s. hydroxide.** An organic compound of the type, $R_3S.OH$. They are strong bases and ionise to R_3S^+ and OH^-. **s. iodide.** An organic compound of the type, R_3SI.

sulfonmethane. Sulfonal.

sulfonaphthalein. A group of compounds similar in constitution to the phthaleins, but having a sulfone, instead of a carbonyl, group. Made by condensation of *o*-sulfobenzoic acid anhydride with phenols. Many are important indicators (q.v.) and dyes:

m-cresol-	cresol purple
o-cresol-	cresol red
dibromo-*o*-cresol-	brom cresol purple
dibromophenol-	brom phenol red
dibromothymol-	brom thymol blue
dichlorophenol-	chlor phenol red
phenol-	phenol red
tetrabromo-*m*-cresol-	brom cresol green
tetrabromophenol-	brom phenol blue
tetrachloro-*m*-cresol-	chlor cresol green
thymol-	thymol blue.

sulfonyl. Sulfuryl. The bivalent radical, $—SO_2—$.

sulfoparaldehyde. $(C_4H_4S_2)_3$ = 448.5. Trithioacetaldehyde. A colorless crystalline powder, insoluble in water, soluble in alcohol or ether; used medicinally as a hypnotic.

sulfophenol. Aseptol.

sulfophenylate. (1) Phenolsulfonate. (2) Phenylsulfate.

sulforhodanide. Thiocyanate.

sulfosalicylic acid. $C_6H_3(OH).(COOH).SO_3H$ = 218.1. A soluble, solid sulfonic acid derivative of salicylic acid, m.120; used as reagent for albumin.

sulfo-salt. (1) A salt of an acid which contains sulfur. (2) An ester of sulfonic acid.

sulfoselenide. A double salt of the type, M_4SSe.

sulfosemicarbazide. A compound containing the monovalent $NH_2.CSNH.NH—$ radical.

sulfosol. A colloidal system with sulfuric acid as the enclosing or disperse phase.

sulfostannate. A compound of the general type, M_2SnS_3; as, Na_2SnS_3. Cf. *sulfatostannate.*

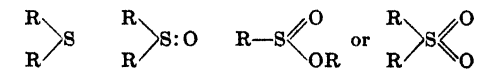
sulfostannite. A compound of the general type, M_2SnS_2.

sulfo-urea. Thiourea.

sulfovinic acid. Ethyl sulfuric acid.

sulfoxide. The divalent radical, $=SO$.

sulfoxides*. A group of organic compounds of the general type, R_2SO or, $R.SO.R$. In derivatives they have the prefix sulfinyl* as, methylsulfoxide*, Me_2SO; methylsulfinylethane*, MeSOEt. They are obtained by oxidation of mercaptans, and are intermediate between the sulfides and sulfones and analogous to the ketones:



sulfides sulfoxides sulfones

sulfoxylate. A salt of the type, M_2SO_2, or, $MHSO_2$, derived from sulfoxylic acid.

sulfoxylic acid. The hypothetical acid, $S(OH)_2$, containing bivalent sulfur. It is known in the form of its salts, Na_2SO_2, and, $NaHSO_2$ (see *rongalite*).

sulfur, sulphur. [sulfur is the spelling adopted by The American Chemical Society, and the Pharmacopoeia of the United States XII.] S = 32.06. Brimstone. A solid non-metal and element, atomic number 16. Sulfur occurs as a yellow, brittle mass or in transparent monoclinic or rhombic crystals and exists in a number of modifications. The more important are: (1) rhombic sulfur, S_8 = 256.4. Stable at ordinary temperatures, d.2.07, m.114, b.444.7. (2) monoclinic sulfur, S_8 = 256.4. Stable above 96°C, and forms transparent, yellow, monoclinic prisms, d.1.957, m.119, b.444.7. (3) amorphous sulfur, S_x. A soft, pale-yellow or fine white powder (colloidal), d.2.046, m.120, b.444.7. If sulfur is heated the following changes and modifications are observed:

Ordinary temp. ..... rhombic, S_8
96°C ..... monoclinic, S_8
114°C, melts to a thin, yellow liquid, S_8 or S_λ
160°C, forms a thick, brown liquid containing thiozon, S_3, besides S_8.
220°C, becomes dark brown and plastic, S_6 and S_8 or $S_{\lambda\mu}$.
250°C, begins to burn if heated in air.
440°C, forms a thin brown liquid, S_6 or S_μ.
44.7°C, boils and forms a reddish-brown vapor of S_6 which, when further heated, becomes lighter in color and larger in volume until, at
860°C, it forms a colorless vapor of S_2, d.2.23.

Sulfur is found native in Sicily and the United States. It is insoluble in water, slightly soluble in alcohol or ether, soluble in carbon disulfide. The solubility varies with the modification. Used in the manufacture of gun-powder, matches, disinfectants, vulcanizing materials, sulfuric acid, sulfides and pharmaceuticals. It forms several series of compounds (see *sulfur compounds*). **colloidal-** Sulfidal, sulfoid. Finely-divided sulfur obtained by passing hydrogen sulfide through a solution of a sulfite; used medicinally for skin diseases. **flowers of-** Sublimed sulfur. **lac-** Precipitated sulfur obtained by adding sulfuric acid to a solution of a polysulfide. It contains up to 45 % calcium sulfate; used in pharmacy. **liver of-** A mixture of potassium sulfide and polysulfides. **milk of-** Precipitated sulfur. **precipitated-** Milk of sulfur. A suspension of finely-divided sulfur obtained by precipitation of calcium pentasulfide or a thiosulfate by an acid. **ruby-** Realgar. **sublimed-** A fine yellow powder obtained by distilling sulfur. **vegetable-** Lycopodium. **washed-** Sulfur washed with ammonium hydroxide and water; used medicinally.

s. acids. See *sulfuric acids.* **s. alcohols.** Hydrosulfides. **s. bromide.** S_2Br_2 = 224.0. Sulfur monobromide. A yellow liquid, d.2.628, soluble in carbon disulfide. **s. chlorides.** (1) S_2Cl_2 = 135.0. Sulfur monochloride. A brown fuming liquid, d.1.709, m.—80, b.138, decomp. by water, soluble in carbon disulfide, alcohol or ether. Used as a reagent; and industrially in vulcanizing rubber, in organic synthesis, for sulfur solvents, war gases, vulcanized oils; also in the purification of sugar. (2) SCl_2. Sulfur dichloride. (3) S_2Cl_4 = 238.02. Trisulfur tetrachloride. (4) SCl_4. Sulfur tetrachloride. **red-** A reddish-brown liquid, d.1.6–1.65, composed of 75 % SCl_2 and 25 % S_2Cl_2; used in the manufacture of varnishes, rubber pigments, poison gas and for synthesis. **yellow-** A yellowish, corrosive liquid, d.1.70, containing 5–9 % free sulfur; used similarly to red s. **s. compounds.** Sulfur has a valency of two, four

or six, and accordingly, forms the following four series of compounds:

A. Valence number, −2.

Hydrogen sulfide..... H_2S
Hydrosulfides (thiols*, RSH)..... M.SH
Sulfides (thioethers, R_2S)..... M_2S
(see *thio compounds*)

B. Valence number, 2.

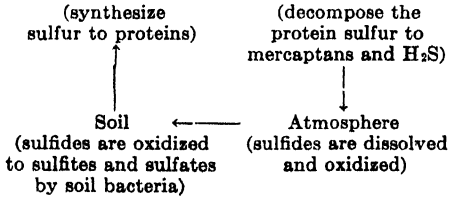
Sulfur dichloride..... SCl_2
Sulfoxylic acid..... $S(OH)_2$

C. Valence number, 4.

Sulfur dioxide..... $O{=}S{=}O$

Sulfurous acid..... 
Sulfites..... 
Sulfinic acids..... 
Sulfones..... 
Sulfoxides..... 
Sulfonium..... 
Sulfinates..... 
D. Valence number, 6.

Sulfur trioxide..... 
Sulfuric acid..... 
Sulfates..... 
Sulfonic acids..... 
Sulfones..... 
s. cycle. The transformation of sulfur compounds by living organisms in relationship to surrounding nature:



s. dichloride. SCl_2 = 103.1. A reddish-brown liquid, d.1.622, m.−78, b.69, decomp. by water or heat. Used in the rubber industry for vulcanizing; for purifying sugar juices; and as a sulfur solvent. It has been stated to be a mixture of the mono- and tetrachloride. **s. dioxide.** SO_2 = 64.1. Sulfurous acid anhydride. A liquid, d.$_0$°1.434; or colorless gas, m.−73, b.−10; soluble in water, alcohol or ether. It is marketed in small iron tanks and is used as a reagent, in bleaching and as a preservative. **s. dyes.** Pyrogenic dyes. A group of organic dyes containing sulfur; obtained by heating amino- or nitro-compounds with alkali sulfides. They are insoluble in water, but soluble in sodium sulfide solutions; used as permanent dyes for cotton, wool or silk. **s. ether.** An organic compound of the type, R_2S. See *thioethers*. **s. fluorescein.** Uranin. **S. fluoride.** S_2F_2 = 102.1. Sulfur monofluoride. A colorless gas, readily hydrolyzed to HF, SO_2 and S. **s. group.** The sixth group of the periodic system, which consists of the elements sulfur, selenium, tellurium and oxygen. **s. hexafluoride.** SF_6 = 146.06. A white solid, insoluble in water, slightly soluble in alcohol or ether, m.−55, b.−50. **s. hexaiodide.** SI_6 = 793.8. Green crystals, soluble in carbon disulfide, decomp. by water. **s. introfier.** See *introfier*. **s. iodide.** S_2I_2 = 317.8. Iodine disulfide, sulfur subiodide. A grayish-black, brittle, crystalline mass of metallic luster, insoluble in water, soluble in glycerol or carbon disulfide; used medicinally in ointments for skin diseases. **s. monobromide.** S. bromide. **s. monochloride.** S. chloride. **s. monofluoride.** S. fluoride. **s. oxides.** See *s. dioxide, s. trioxide*. **s. oxychlorides:** (1) SO_2Cl_4 = 205.96. A red liquid, d.1.656, b.100. decomp. by water. (2) $S_2O_3Cl_4$ = 253.96. White needles, m.57 (subliming). They are decomp. by water. (3) See *sulfuryl chloride*. **s. oxyfluoride.** SO_2F_2 = 134.12. Sulfuryl fluoride. An irritating vapor or extremely pungent liquid. **s. subbromide.** S. bromide. **s. subchloride.** S. chloride. **s. subiodide.** S. iodide. **s. tetrachloride.** SCl_4 = 173.9. A yellow liquid or yellow-white solid, m.−31. It is unstable, but forms stable compounds of the type $2AlI_3{,}SCl_4$. **s. trioxide.** SO_3 = 80.1. Sulfuric acid anhydride. *solid-* $(SO_3)_2$. Colorless crystalline prisms, d.1.982, m.15, b.46, rapidly decomp. by water and form sulfuric acid; soluble in conc. sulfuric acid. **s. yellow.** Naphthol yellow.

sulfur acids. The following acids of sulfur and their *salts*, are known:

H_2S—hydrosulfuric acid or hydrogen sulfide.
H_2S_5—hydrogen pentasulfide (H_2SS_4).
H_2SO_3—sulfurous acid, *sulfite*.
H_2SO_4—sulfuric acid, *sulfate*.
$H_2SO_4 + SO_3$—oleum.
$H_2S_2O_3$—thiosulfuric acid, *thiosulfate*.
$H_2S_2O_4$—dithionous acid, *hyposulfite, dithionite*.
$H_2S_2O_5$—Caro's acid, metasulfuric acid.
$H_2S_2O_6$—dithionic acid, *hyposulfate, dithionate*.
$H_2S_2O_7$—pyrosulfuric acid, *pyrosulfate*.
$H_2S_2O_8$—persulfuric acid, *persulfate*.
$H_2S_3O_6$—trithionic acid, *trithionate*.
$H_2S_4O_6$—tetrathionic acid, *tetrathionate*.
$H_2S_5O_6$—pentathionic acid, *pentathionate*.
$H_2S_6O_6$—hexathionic acid, *hexathionate*.

s. anhydride. Sulfur trioxide.

sulfurated, sulphuretted. Combined with sulfur. **s. oil.** An essential oil containing sulfur compounds; as, mustard oil.

sulfuret. A sulfide.

sulfuretted hydrogen. Hydrogen sulfide.

sulfuric. Pertaining to hexavalent sulfur. **s. acid.** See *sulfur a., sulfuric acid*. **s. anhydride.** Sulfur trioxide. **s. chloride.** Sulfuryl chloride.

sulfuric acid. H_2SO_4 = 98.1. Oil of vitroil, spirit of vitriol, hydrogen sulfate. A dibasic acid obtained from sulfur dioxide (see *sulfuric acid manufacture*), and used extensively technically.

(1) H_2SO_4 = 98.1, d.1.8542, m.10, b.316.
(2) $H_2SO_4.H_2O$ = 116.1. Colorless prisms, d.-1.788, m.8, b.210; soluble in water, decomposed by alcohol.
(3) $H_2SO_4.2H_2O$ = 134.1. Colorless liquid, d.-1.665, m.−38, b.170; soluble in water, alcohol or ether
(4) $H_2SO_4.xH_2O$..d.1.84...concentrated acid, 94 %
(5) .....d.1.826..U.S.P. conc. 92.5 %
(6) .....d.1.067..U.S.P. diluted 10 %
(7) $H_2SO_4.xSO_3$.....oleum (above 100 %)

Cf. *sulfamide, sulfaminic acid, sulfur-acids B.O.V., D.O.V., R.O.V.* **chloro-** See *chlorosulfuric acid.* **concentrated-** See (4) (5). **dilute-** See (6). **ethyl-** See *ethylsulfuric acid.* **fuming-** See (7). **glycerol-** q.v. **nitro-** q.v. **nitroso-** q.v. **Nordhausen-** Oleum. **phenol-** Phenylsulfuric acid. **s. manufacture.** Two principal processes: (A) Lead chamber process—Sulfur or pyrites is burned in furnaces and the sulfur dioxide formed passes through the Glover tower, where it comes in contact with 65 % sulfuric acid from the lead chamber and the acid containing oxides of nitrogen from the Gay-Lussac tower. A portion of the SO_2 is oxidized and dissolved. The remaining mixture of gases, consisting now principally of SO_2 and NO, passes into the lead chamber, where the principal reaction occurs:

$$So_2 + O_2 + NO \rightarrow SO_3 + NO_2 \rightarrow H_2SO_4(65\ \%)$$

The escaping NO_2 is passed through the Gay-Lussac tower, in which it is dissolved in strong sulfuric acid from the Glover tower. The acids collecting at the bottom of the lead chambers are finally concentrated in pans by heat. (B) Contact process—Sulfur or pyrites is burned in furnaces and the SO_2 formed passes through scrubbers. In some the gas is washed with water; in others it is dried with sulfuric acid. The dry gas enters the contact chamber in which a catalyst, (generally platinum or iron oxide) oxidizes it to SO_3 which, in turn, is passed through water and absorbed as sulfuric acid.

sulfuric esters. Sulfuric acid esters. An organic compound of the type, R_2SO_4.

sulfuric ether. An erroneous name for the ether of commerce, diethylether, Et_2O.

sulfuring. (1) Burning sulfur in barrels to disinfect them for wines, etc. (2) Dressing growing crops with flowers of sulfur to arrest mold growth. (3) Adding sulfur to the fires used in hop kilns to liberate SO_2 for its preserving effect.

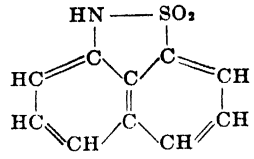
sulfurize. To combine with sulfur.

sulfurous. Pertaining to tetravalent sulfur. **s. acid.** H_2SO_3 = 82.1. $SO(OH)_2$. An aqueous solution of sulfur dioxide, which contains about 6 % SO_2. A clear, colorless liquid, d.1.03, used as a reducing agent and in bleaching textiles. *ethyl-* See *ethylsulfurous a.* **s. anhydride.** Sulfur dioxide. **s. esters.** Organic compounds of the type, R_2SO_3.

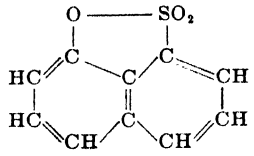
sulfuryl. Sulfonyl. The divalent radical, $=SO_2$, derived from sulfuric acid by subtraction of two —OH groups. **s. chloride.** SO_2Cl_2 = 135.0. Sulfuric chloride, chlorsulfuric acid. A colorless, extremely pungent liquid, $d_{20°}$.1.66, b.69, decomp. by water; used as a reagent and in organic synthesis. **s. diamide.** Sulfamide. **s. fluoride.** Sulfur oxyfluoride.

sulph-, sulpho-, sulphur, sulphuretted, sulphuric, etc. See *sulf-, sulfo-, sulfur, sulfurated, sulfuric,* etc. (The American Chemical Society, and the U.S.P. XII, prefer the latter spelling.)

sultam. A derivative of a 1.8-naphthylamine sulfonic acid having the characteristic grouping,



sultone. A derivative of 1.8-naphthol-sulfonic acid, having the characteristic grouping,



sulvanite. Cu_3VS_4. A vanadium mineral.

sumach. (1) The shrub *Rhus coviaria*, Sicilian s., an Anacardiaceae of Southern Europe, whose leaves are used for tanning and dyeing. (2) Any of the *Rhus* species. (3) Sumac. A tanning material (18–25 % tannin) from the dried leaves of *Rhus* species:

Rhus copellina	American s.
Rhus coriaria	Sicilian s.
Rhus cotinus	Venetian s.
Rhus glabra	White s.
Rhus metopium	American s.
Rhus pentaphylla	Tizra s.
Rhus succedania	Indian s.

Cf. *fustic.* **Chinese-** Tree-of-heaven. The bark of *Ailanthus glandulosa*, a Simarubiaceae, used as an astringent and antispasmodic, and for tanning. **curriers-** The plant *Coriaria myrtifolia*, a Coraniaceae, containing coria myrtin. **smooth-** Sumac berries. The dried ripe fruit of *R. glabra*, used as an astringent and tonic. **sweet-** Fragrant s. The bark of the root of *R. aromatica*, used as an astringent and diuretic. **s. bark.** Sweet s. **s. berries.** Smooth s.

sumaresinol. $C_{30}H_{48}O_4.4H_2O$ = 544.35. Sumaresinolic acid. A resin acid, m.298, from Sumatra gum benzoin.

sumbul. Musk-root. The dried rhizome of *Ferula sumbul*, an Umbelliferae of Asia. Used medicinally as a nerve stimulant and antispasmodic.

sump. An open channel or pit for collecting dripping liquids in works, factories, etc., prior to removal by pumping.

sun. The star nearest to the earth; mass 1.99 × 10^{33} grams, d.5.00, luminosity −26.7, surface temperature 6000°C. Cf. *spectral classification, solar spectrum, earth constants.* **s. light.** Intensity on a clear day = 100,000 to 125,000 lux.

SUN'S ATMOSPHERE

	By volume, per cent	By weight, per cent
1. hydrogen.....	92	46
2. helium.....	3	6
3. oxygen.....	3	24
4. metals.....	2	24

Metallic vapors in the sun's atmosphere, in tons per square mile

Mg 350	Al 15	V 1.5
Fe 250	Ni 15	Cu 1.5
Si 150	Mn 10	Zn 1.0
Na 100	Co 6	others 0.2
K 50	Cr 6	
Ca 50	Ti 2	Total 1,008

sundew. Drosera.

sunflower. Helianthus. The dried seeds of *Helianthus annuus*, a Compositae; used medicinally, as the fluid extract, as a diuretic. **s. oil.** A slow-drying oil extracted from the seeds of s.

sunstone. Orthoclase.

super- A prefix derived from the Latin, which indicates "above," "beyond" or "higher."

superacid. Excessively acid in reaction. **s. solution.** A solution in acetic or phosphoric acid.

superacidity. An increased acidity of the gastric juice.

superbine. A poisonous bitter principle from *Gloriosa superba*, a Liliaceae of India and South Africa, which resembles the bitter principle of squill. The plant is often used for suicidal purposes.

supercalender. A calender, (q.v.) which uses both steam and high pressure to obtain a high finish; *e.g.*, on paper for illustrations.

supercarbonate. Bicarbonate.

superchlorination. A process of sterilizing water by chlorinating in excess, and then adding an antichlor.

superconductivity. Supraconductivity.

supercooled. Over- or undercooled. Cooled below the freezing-point of a liquid without the separation of solid matter.

superheated. Overheated. Describing a liquid or gas heated above its boiling point in the liquid state; as superheated steam, *i.e.*, water vapor heated above 100°C.

supernatant. The liquid standing above a sediment or precipitate.

supernickel. An alloy of 30 % of nickel and 70 % of copper. It retains its strength at high temperatures better than most copper alloys.

supernormal. A volumetric solution of greater concentration than normal; as, 2N-solution.

superol. o-Hydroxy quinoline sulfate.

superoxide. Peroxide.

superpalite. A poison gas; cf. *palite*.

superphosphate. (1) An acid phosphate. (2) A mixture of calcium phosphate and calcium sulfate obtained by the action of conc. sulfuric acid on phosphate minerals (apatite, phosphorite); used as fertilizer. **ammoniated-** A fertilizer containing s. or dissolved bone or both, but no potash. **double-** A fertilizer made by the action of phosphoric acid on rock phosphate; it contains 40–50 % P_2O_5.

superpolymer. A polymer whose molecular weight is 10,000 or more.

superpotential. Overvoltage.

supersaturate. To more than saturate.

supersaturated solution. A solution that contains an excess of dissolved substance over the amount normally required for saturation at a particular temperature, but which still holds it all in solution; usually obtained by slowly cooling a saturated solution.

supersaturation. Containing an abnormally high proportion of solute.

supersolubility. Supersaturation. **s. curve.** The curve obtained by plotting the concentration of a supersaturated solution against the temperature. It is analogous to and parallel with the solubility curve, q.v.

supersonic. Ultraphonic.

supersteel. A high-speed steel, q.v.

supertension. Overvoltage.

support. A device for holding an apparatus or vessel in position.

suppurative. An agent that produces pus.

supra- A prefix derived from the Latin, and indicating "above."

supracapsuline. Adrenalin.

supraconductivity. The property of certain metals of becoming good conductors of electricity near the absolute zero. The temperature at which this takes place is: 7.2°K for Pb; 4.21°K for Hg; 3.71°K for Sn; 3.41°K for In; and 2.47°K for Tl. No other metal shows any change above 1.3°K, the temperature limit of present methods.

suprarenal. A gland located above the kidney. **s. liquid.** An aqueous extract of the suprarenal gland, used medicinally.

suprarenalin. Adrenalin.

suprarenin. The acid tartrate of synthetic epinephrine (adrenalin). A white odorless powder, m.211, insoluble in water, used medicinally.

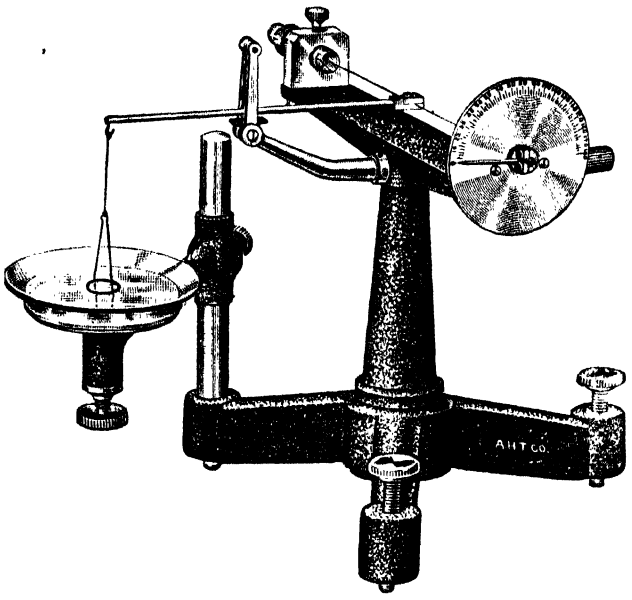
suprasterols. A group of sterols produced by irradiation of lumisterol. Cf. *cholane derivatives*.

suramin. Bayer 205.

surcharge. The sum of the errors involved in an assay, which is often included in the assay report.

surface. The outer part of a body. A magnitude that has length and breadth but not thickness. **s. density.** The electric or magnetic charge per unit area located on the surface of an electrode or other body. See *current density*. **s. energy.** The product obtained by multiplying surface tension by the two-thirds power of the molecular weight and specific volume. **s. tension.** The contractile surface force of a liquid by which it tends to assume a spherical form and to present the least possible surface (*e.g.*, the formation of a meniscus). It may also be exerted at the junction of two liquids. It is measured directly (g. per $cm.^2$ or dynes), or indirectly by determining the capillarity. Increase in temperature or the addition of certain substances lowers the surface tension. The s. t. (at const. temp.), γ, is in a constant ratio to the fourth power of the orthobaric densities of liquid, D, and gas, d; hence $\gamma^{\frac{1}{4}} = K(D - d)$. Cf. *parachor*. **s. tension apparatus.** Tensiometer. A device for determining the surface tension, based upon the flexibility

of a wire (accurate within 0.1 dyne). See illustration. **s. t. 37.** See under *S.*



Surface tension apparatus.

surfusion. The unstable condition of a liquid cooled below its freezing point without solidifying. Cf. *supercooled.*

surpalite. Diphosgene.

surrogate. A substance used as a substitute for another substance; as, margarine for butter.

surrosion. The increase in weight of a substance owing to corrosion.

susceptible. (1) Sensitive. Readily capable of responding to an action or force; as, magnetic susceptibility. (2) See *immune.*

susotoxin. $C_{10}H_{26}N_2$ = 174.3. Sustoxin. A ptomaine from cultures of hog-cholera bacillus.

suspension. (1) Suspensoid. (2) A thin thread of steel, phosphor-bronze or other substance, on which the mirror and magnet of a galvanometer hang. **s. method.** The determination of the density of minerals or powders by placing them in a solution of known density; as, Rohrbach's, Thiel and Stohl's, or Thoulet's solution.

suspensoid. Suspension, soliquoid. Finely-divided, colloidal particles floating in a liquid; the particles are so small that they do not settle, but are kept in motion by the moving molecules of the liquid (Brownian motion, q.v.).

sussexite. A native, hydrated magnesium manganese pyroborate.

sustoxin. Susotoxin.

Sutherland's equation. The diameter of a molecule, D, is determined by

$$D = [1.402/\sqrt{2}\,\pi NL(1 + C/T)]^{\frac{1}{3}}$$

where N is the number of molecules per unit volume, L the mean free path (cm.), and C is Sutherland's constant. **S.-Einstein equation:** $D = \frac{RT}{Nf}$, where D is the diffusion constant, R the gas constant, T the absolute temperature, N Avogadro's constant and f the frictional force in dynes on each molecule having unit velocity.

Sved. A unit of sedimentation rate.

Svedberg, The(odor). 1884– . A Swedish physical chemist, noted for research on colloids and Nobel prize winner (1926). **S.'s. equation.** The amplitude, A, of Brownian movement of a particle is proportional to its vibration period, t. Thus: $A = kt$, where k is a constant.

swage. To fashion metal, particularly iron, by drawing it into a groove, mold or die having the desired shape.

Swain, Robert Eckles. 1875– . An American chemist noted for research in physiological chemistry.

Swan, Sir Joseph Wilson. 1828–1914. An English chemist, noted as pioneer in photographic processes, electric carbon filament lamps and electrodeposition of metals.

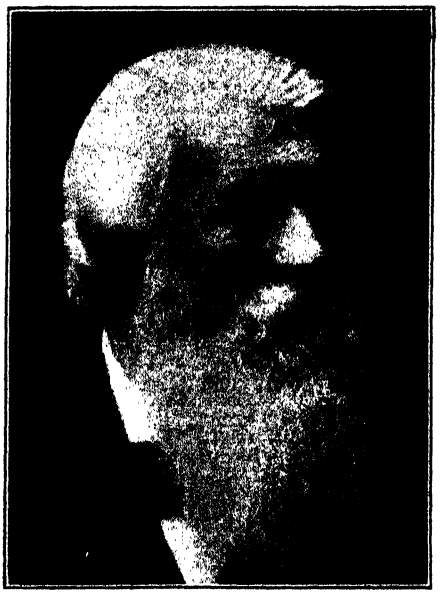
swan neck. A tube bent into the shape of an upright U-tube joined to an inverted U-tube; thus S.

swarf. The raw edge of a metallic object produced in casting metals, and removed for re-use.

Swarts, Frederic. A Dutch chemist noted for organic research.

Swedenborg, Emanuel. 1688–1772. A Swedish mineralogist and later, theosophist, who invented the mercury pumps and wrote books on chemistry.

sweet flag. Calamus.



Joseph Wilson Swan.

sweeten. (1) To remove substances of unpleasant odor (as mercaptans) from spirits, petroleum, etc., usually by oxidation. (2) To purify. (3) To add a sugar.

sweetness. The taste of sugars. The relative physiological response has been determined by the University of Minnesota as follows:

fructose	175
invert sugar	123
sucrose	100
glucose	74
xylose	40
maltose	32
rhamnose	32
galactose	32
raffinose	23
lactose	16
For synthetic agents *estimated* as:	
peryllartine	2000
saccharin	700
sucrol	300

Cf. *dulcigen, sapiphore.*

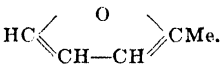
swelling. The adsorption of water by an amorphous substance, with the formation of a jelly. It is assumed to be due to a chemical reaction with water, distinct from hydrolysis, and the formation of a zone (q.v.) of oriented molecules.

sycoceryl alcohol. $C_{18}H_{30}O$ = 262.23. Colorless crystals, m.90. Cf. *lactucerol.*

syenite. A granular igneous rock which consists chiefly of orthoclase with or without albite, biotite, hornblende, microcline or corundum.

sykose. A brand of saccharin.

sylvan. C_5H_6O = 82.1. α-Methylfuran,



A constituent of wood-tar. A yellowish liquid, d.0.916, b.63, soluble in alcohol.

sylvanite. $(Au,Ag)Te_2$. Graphic tellurium. A native telluride of gold and silver.

sylvanium. Tellurium.

sylvate. A salt of abietic acid, $C_{19}H_{24}COOM$.

sylvic acid. Abietic acid.

sylviculture. The study of forestry.

sylvine. An isomorphous native mixture of Na and K chlorides, richer than carnallite.

sylvinite. A sylvite, with rocksalt, containing about 16 % K_2O; used as a fertilizer.

sylvite. KCl. A native potassium chloride, from Stassfurt; used as a fertilizer.

Sylvius, François. 1614–1672. (Dubois de la Boë.) A German-born, Dutch physician who considered combustion and respiration and similar physiological functions, both normal and pathological, as based on chemical reactions.

sym- Abbreviation for symmetrical.

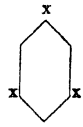
symbiosis. A partnership of two different living organisms, either vegetable or animal, which is of mutual benefit to both species. **antagonistic-** An association of two living organisms of different species in which one derives more benefit than the other. **conjunctive-** The living together of two vegetable or animal organisms with bodily union between them; as, lichens, which consist of algae and fungi. **disjunctive-** An association of two living organisms that are not actually united.

symbiotic fixation. The conversion of atmospheric nitrogen to nitrates or nitrites by soil bacteria and leguminous plants. Cf. *nitrogen fixation.*

symbol. Any mark which represents some substance, quality or relation. **chemical-** A letter or a combination of letters that represents an atom of an element and its relative mass. A chemical symbol is used in several distinct ways: (1) to indicate an atom; as, H, Na, S, or Fe. (2) To indicate an ion; as, H^+, Na^+, S^{--}, or Fe^{++}. (3) To indicate a molecule; as, H_2, Na_x, S_8, or Fe_x. (4) To indicate a gram-atom or gram-molecule, thus, H = 1 gm. hydrogen, H_2 = 2 grams of hydrogen, $2H_2$ = 4 grams of hydrogen. (See *mol.*) (5) To indicate an excited atom, by an asterisk, as, H*. (6) To indicate an isotope by its isotopic weight or small letter showing its abundance; as, Cl^{35}, Cl^{37} or Cl^a, Cl^b. (7) To indicate an atomic nucleus by prefixing its charge (atomic number) as subscript, and suffixing its mass (isotopic weight) as superscript; thus, $_2He^4$ and $_7N^{14}$. See: *Report of a Joint Committee of the Chemical, Faraday and Physical Societies on Symbols*, 1937. *British Standards Institution*, Standard Nos. 423, 1938 (electrical); 560, 1934 (engineering); 813, 1938 (chemical); 974, 1941 (chemical plant). Cf. *notation, formula, alchemistic symbols.* **mathematical-** A letter that indicates quantity; or a mark that indicates or forms part of an algebraic operation. **structure-** A graph that indicates the arrangement of atoms in an organic compound (see *structure symbols*).

symmetric, symmetrical. Having constituent parts arranged in a definite pattern, repeated over and over again in a definite direction of space; as atoms in a crystal. (2) Describing a s. compound. **axial-** See *stereoisomerism.* **plane-** See *stereoisomerism.*

s. carbon atom. See *asymmetric carbon, optical activity, stereoisomerism.* **s. compound.** A benzene derivative in which substitution of the 1,3, and 5-hydrogen atoms has taken place; as,



symmetry. Being symmetrical. The s. of a crystal is determined by regularities in the positions of the similar faces or edges etc., and is defined by the number of elements of symmetry, q.v. (See *crystal systems.*) **axis of-** An imaginary axis through a symmetrical body. If such a body is rotated round this axis, the body occupies the same position in space more than once in a complete turn. **center of-** A central point of a symmetrical body, around which like faces are arranged in opposite pairs. **elements of-** The number of planes, axes and centers of s. of a symmetrical body. A cube has the largest possible number (23), made up of 9 planes, 13 axes, and one center. **external-** The s. of the outside crystal form as distinct from the internal s. of the arrangement of the atoms. **geometrical-** The external shape of a crystal, which resembles that of a geometrical figure. **internal-** The s. of the arrangement of the atoms inside a crystal, as distinct from its external s. **plane of-** An imaginary plane through a symmetrical body, that divides it into halves which are mirror images. Cf. projection *nucleus.*

s. groups. The grouping of crystals into systems according to the number and nature of their elements of symmetry. Thirty-two types exist, of which eleven cover most common substances. See *crystal systems.*

sympathetic. Pertaining to or related to a mutual relationship. **s. ink.** A secret or invisible ink

which is visible only if heated (as cobaltous chloride solution) or when treated with a specific reagent; as, writing with tannic acid solution and developing with ferrous sulfate. **s. reaction.** Induced *reaction*.

sympathin. A hormone produced in smooth muscle under sympathetic impulse, causing augmentation of blood pressure, heart rate and salivary secretion. It resembles epinephrine. Cf. *sympathol*(2).

sympathol. (1) $C_9H_{13}O_2N.HCl$ = 203.6. Methyl-δ-hydroxy-β-p-hydroxy-phenylethylamine hydrochloride. Colorless crystals, m.184, similar to adrenalin in pharmacological action. (2) $C_9H_{13}NO_2$ = 167.1. *p*-Hydroxy-α-(methylamino methyl)-benzyl alcohol. $HO.C_6H_4.CMeOH.NHMe$. Probably identical with sympathin.

sympathomimetic action. The stimulation of the sympathetic nervous system by drugs.

symphorol. Any of the salts of caffeine sulfonic acid, used medicinally as diuretics; as,

symphorol L—Lithium-caffeine sulfonate.

symphorol N—Sodium-caffeine sulfonate or nasrol.

symphorol S—Strontium-caffeine sulfonate.

symplocarpus. Skunk cabbage.

symphytum. Bruisewort, comfrey, blackwort. The dried root of *Symphytum officinale*, a Boraginaceae of Europe and Asia; used medicinally as a demulcent.

syn- (1) A prefix derived from the Greek "with" or "together," which signifies union, association or "building up." (2) The syn-position.

syn-position. *σ*. The position occupied by two radicals in that type of stereo-isomerism in which they are closer together than in the corresponding anti-position. (See *stereo-isomerism*.) The radicals are related in that they are similar or may tend to react, *e.g.*, H and OH may split out and form water.

synaldoxime. See *aldoxime*.

synanthrose. $C_6H_{10}O_5$ = 162.1. Levulin. A carbohydrate isomeric with inulin, from the rhizomes of *Helianthus tuberosus*, a compositaceous plant.

synaptase. Emulsin.

syncaine. Procaine.

synchronal. Occurring at the same time.

synchronism. The occurrence of two or more phenomena at the same time.

synchronizing. To control two or more phenomena so that they occur at the same time; as, a speed-controller for a number of current generators.

syncyanin. A blue pigment produced by the bacteria, *B. syncyanus*, and *B. cyanogenus*.

syndiazotate. See *diazotate*.

synephrin. $C_9H_{14}NO_2$ = 168.1. A white crystalline powder, used as vasoconstrictor.

syneresis. The contraction of a clot or gel; as of blood or milk.

syngenite. $CaSO_4.K_2SO_4.H_2O$. A native potassium-calcium sulfate.

synonym. One of the different names given to the same substance; as, wood alcohol, methyl alcohol or wood-spirit are synonyms for methanol.

syntan. (1) A sulfurized phenol. (2) An artificial tanning material made by the sulfonation of hydrocarbons; *e.g.*, naphtha.

synthalin. The synthetic HCl-salt of decamethylene bisguanidine, $NH_2.C:NH.NH(CH_2)_{12}NH.C:NH.NH_2$. Used as an insulin substitute, and given by mouth (1 insulin unit = 1 mg. synthalin). Now known to be ineffective. **s. B.** Dodecamethylene bisguanidine hydrochloride.

synthesis. The processes and operations necessary to build up a compound. In general, a reaction, or series of reactions, in which a complex compound is obtained from elements or simple compounds. Cf. *analysis*. **electro-** q.v. **organic-** The production of dye-stuffs and medicinals; or the artificial production of a naturally-occurring substance, *e.g.*, indigo, camphor, rubber or quinine. **photo-** q.v.

synthesize. To produce a complex compound from simpler compounds.

synthetic. (1) Produced synthetically. (2) Produced by artificial means. **s. drying oil.** See *oil*. **s. resins.** The plastics, q.v., produced by (a) polymerization (olefines, polyolefines); or (b) condensation (phenolaldehyde, ketone-aldehyde or hydrocarbon aldehyde). Also in a wider sense the polymers of organic compounds; such as, (a) association polymers (viscose silk), (b) hemicolloidal polymers (warm styrene), or (c) eucolloidal polymers (cold styrene).

synthetic. An artificially-produced organic compound used in medicine.

synthol. A synthetic motor fuel obtained from carbon monoxide and hydrogen, in the form of water-gas, when subjected to a pressure of 75 to 150 atmospheres at 400–435°C. with a catalyst (iron and sodium carbonate). It is a mixture of higher alcohols, aldehydes, ketones and higher fatty acids with aliphatic hydrocarbons; heating value, 8200 calories per kg.

syntonin. Muscle fibrin, parapeptone, acid albumin. An acid albumin obtained from albumose by the action of dilute hydrochloric acid. A yellowish powder, insoluble in water, soluble in acids. It is produced in the body as an intermediate product of the gastric digestion of proteins, which eventually become peptones.

syphon. See *siphon*.

syr. An abbreviation for syrup.

syringa. The dried leaves and fruits of *Syringa vulgaris*, the lilac bush, an Oleaceae of America and Europe. It contains several glucosides, and is used as bitter tonic.

syringe. A tube, usually of glass, with a jet at one end and a small piston-pump or bladder at the other; for injections.

syringenin. $C_{11}H_{14}O_4$ = 210.1. Oxymethyl coniferin. A light, rose-red, amorphous mass from syringa; nsoluble in water or alcohol, soluble in ether. It is formed by hydrolysis of syringin.

syringetin. $C_{17}H_{14}O_8$ = 314.11. 3.4'.5.7-tetrahydroxy-3'.5'-dimethoxy flavone. A flavone (q.v.) from lilac.

syringic acid. $C_9H_{10}O_5$ = 198.1. 4-Hydroxy-3.5-dimethoxybenzoic acid. An acid obtained by hydrolysis of syringin.

syringin. $C_{17}H_{24}O_9.H_2O$ = 390.3. Lilacin, ligustrin. A glucoside from *Syringa vulgaris* (lilac), an Oleaceae, *Ligustrum vulgare* (privet), *Robinia pseud-acacia*, or other plants. Long white needles, m.212, slightly soluble in water or alcohol, insoluble in ether. Used medicinally as an antipyretic and antiperiodic. Cf. *syringenin*.

syrup. Sirup. A concentrated aqueous solution of a carbohydrate (as, cane sugar), with or without drugs. **simple-** Syrupus simplex. An

aqueous solution of cane sugar (83 %); a viscous liquid, d.1.313.

s. acacia. A 10 % solution of acacia in sucrose syrup.

system. (1) A combination of matter containing one or more phases. (2) An organized and related group of facts, phenomena or ideas. **binary-** A s. involving two components (elements or compounds). **condensed-** A s. which contains no gaseous phase. **divariant-** A s. with two degrees of freedom (cf. *phase rule*) which can be represented by an area on a diagram, q.v. **geological-** See *epochs, strata.* **heterogeneous-** A s. containing two or more phases or distinct regions, separated from one another by definite boundaries. **homogeneous-** A s. containing no definite boundaries; one whose properties are the same at all parts, or vary gradually from point to point. **mobile-** A s. which responds readily to external conditions, as pressure and temperature. **monovariant-** A s. with one degree of freedom (cf. *phase rule*), Its conditions are given by the *line* of a diagram, q.v. **nonvariant-** A s. with no degree of freedom (cf. *phase rule*). It is represented by a point on a diagram, (q.v.); thus for ice-water-steam, a P of 4.6 mm. and T of 0.007°C. **periodic-** See *periodic system.* **quarternary-** A s. involving four components. **ring-** See *ring system.* **stable-** A s. which does not respond readily to a changing environment. **tertiary-** A s. involving three components. **thermodynamic-** A system which may consist of matter, energy, or both, and is limited by a physical or imaginary boundary. **unstable-** See *mobile* s.

s. of compounds. See *notation, organic compounds, chemicals.* **s. of elements.** See *periodic system.* **s. of stars.** See *spectral classification.*

szomolnokite. $FeSO_4.H_2O$. A native ferrous sulfate.

T

T. An abbreviation for: (1) time; (2) absolute temperature; (3) triple bond, thus T^3 = a triple bond between the third and fourth carbon atom, cf. Δ (*delta*); (4) transport number.

t. An abbreviation for: (1) metric ton; (2) time; (3) temperature (not on absolute scale).

τ. The Greek letter "tau." The symbol for quantum number; τ_1 = azimutal; τ_2 = radial.

θ. The Greek letter "theta." Symbol for thermodynamic temperature.

Θ. The Greek capital letter "theta." (1) A symbol for the absolute temperature at which C_v is $\frac{3}{2}R$. (2) The absolute temperature of a transition point.

Ta. The symbol for tantalum, At. No. 73.

tabacin. The toxic principle of tobacco. A yellow, waxy, hygroscopic, acid glucoside containing nitrogen, decomp. 110.

tabacum. Tobacco.

tabashir. Tabashis.

tabashis. A secretion of bamboo containing lime and silica; used by Hindus as a cure for tuberculosis.

table. (1) A lamella, or flat, scale-like crystal. (2) The flat surface of a precious stone. **t. salt.** Sodium chloride. *iodized-* Sodium chloride with 0.1 % of potassium or sodium iodide. **t. spoon.** An empirical measure, equivalent to about 15 cc. or ½ fluidounce. **t. top impregnation.** An acid-proof, waterproof impregnation for laboratory tables. It consists of two alternate coatings each of solutions A and B, the scraping off of surplus precipitates, and the final treatment and polishing with linseed oil:

A.	Copper sulfate	100 gm.
	Potassium chlorate	100 gm.
	Water	800 cc.
	Boil and apply hot.	
B.	Aniline	120 cc.
	Hydrochloric acid	180 cc.
	Water	1000 cc.

Apply in the order A, B, A, B, let dry for one day, then sand-paper and rub in linseed oil. Caution: the scraped-off surplus is liable to self-combustion.

tablet. Tabloid. Any medicated disk made by incorporating a drug into a mixture of absorbents or adhesives, and passing the slightly-moistened mixture through a tablet machine. The substances, other than drugs or coloring materials, that enter into the composition of a tablet are: (1) A moistening agent—water or alcohol. (2) Absorbents—starch, milk-sugar, magnesium carbonate, magnesium oxide or licorice root. (3) Adhesives—cane sugar, tragacanth, acacia, glucose, gelatin, dextrin, flour boric acid. **effervescent-** A tablet in which an effervescent mixture is incorporated, thus causing rapid solution in water. Cf. *pill.*

tabloid. A small tablet.

tabular crystal. A table-shaped or flattened crystal. **t. spar.** Wollastonite.

tacamahac. (1) A resin from *Calophyllum tacamahaca*, a Guttiferae. (2) A resin from *Populus balsamifera*, balsam poplar, a Salicaceae.

Tachenius, Otto. 17th century. A German physician and chemist, the first to use distilled water and to suspect a hidden acid in oils and fats; author of *Epistola de famoso liquore alcahest* (1655) and *Hippocrates chymicus* (1674).

tachhydrite. $CaCl_2.2MgCl_2.12H_2O$. A white or yellow, very hygroscopic, native calcium magnesium chloride; d.1.671, very soluble in water.

tachia. Caferana. The dried root of *Tachia guianensis*, a Gentianaceae of South Africa and South America; it contains glucosides. Used medicinally for malaria, and as a tonic. Cf. *caferanine, tachinin.*

tachinin. A glucoside from tachia.

tachiol. Silver fluoride. **iso-** Silver silicofluoride.

tachogram. A curve that indicates the speed of the blood current.

tachometer. (1) A device for recording the speed of the blood current. (2) An instrument for recording the angular speed of a revolving shaft in revolutions per minute.

tachylite. A dark, basic, volcanic glass.

tachymeter. A speed-recorder or speedometer.

tachyol. Tachiol.

tachysterol. An isomer of ergosterol which yields vitamin D, (q.v.) on irradiation. Cf. *cholane derivatives.*

tackiness. The property of being sticky; sa, of resins.

tactile. Pertaining to touch.

tæ- *tae-, te-.*

tael. A Chinese bullion weight unit; 1⅓ oz. av.

taeniacide. Teniacide.

taeniafuge. Teniafuge.

taenite. A constituent of iron-nickel meteoric alloys, containing 35–48 % Ni.

tagatone. $C_{10}H_{18}O$ = 154.14. A ketone, related to myrcene, found in the volatile oil of *Tagates glandulifera*, a Compositae.

tagatose. $C_6H_{12}O_6$ = 180.09. A hexose; its *d*-form, m.124, is an unfermentable ketohexose.

tagud nut. The dried fruit of the negrito palm, *Phytelephas macrocarpa;* the source of vegetable ivory.

tagulaway. Cebur. The dried bark of *Parameria vulneraria*, an Apocynaceae of the Philippine Islands. It contains a resin and caoutchouc.

taka amylase. (from Japanese, "taka"-strong). An amylolytic enzyme found with taka diastase. **t. diastase.** An enzyme from a fungus growing on bran, similar in action to diastase. **t. maltase.** An enzyme analogous to maltase and found with taka-diastase.

Talbot, William Henry Fox. 1799–1877. An English archaeologist and inventor of photographic paper (1840) and plates. **T.'s law.** If any part of the eye retina is excited with intermittent light recurring periodically and regularly and, if the period is sufficiently short, a continuous impression will result; as, in moving pictures.

talc. (1) $3MgO.4SiO_2.H_2O$. Talcum, soapstone, rensselaerite. A hydrous magnesium silicate, having a soft, greasy touch, and found in various grades; as, potstone, steatite, French chalk. Purified talcum is used as a dusting powder, as a filtering material and in making crayons. (2) In England; mica used for glazing.

talcum. Talc (1).

talisai oil. An oil from the seeds of *Terminalia catappa*, country almond, a Combretaceae.

talite. Talitol.

talitol. $C_6H_{14}O_6$ = 182.1. Talite. A hexatomic alcohol, $CH_2OH(CHOH)_4CH_2OH$, obtained by reduction of talose; m.86.

talloil. A by-product from sulfate woodpulp digestion, consisting mainly of resin acids and fatty acids. Used for the manufacture of soap, varnishes and fruit sprays.

tallol. Floating soap. An emulsifying agent obtained from black liquors produced in the manufacture of sulfate and soda pulps. Cf. *talloil.*

tallois-desmi. Talmi.

tallow. A solid fat; as suet, q.v. **bone-** See *bone.* **Borneo-** Illipé butter (misnomer). A fat used in the chocolate industry, from shared fats. **Japan-** See *Japan wax.* **mineral-** Hatchettinine.

Tallquist scale. A thin brochure of perforated sections of blotting paper and ten printed shades of hemoglobin (10 % to 100 %). Diagnosis is made by matching a blot of blood with the color scale.

talmi. Talmi-gold, tallois-desmi. A gold-plated brass used in jewelry.

talomucic acid. $C_6H_{10}O_8$ = 210.07. The dibasic acid, $COOH(CHOH)_4COOH$ derived from talose and altrose. White crystals, m.158, soluble in water; occurring *d-* and *l*-forms. Cf *mucic acid.*

talonic acid. $C_6H_{12}O_7$ = 196.1. The monobasic acid, $CH_2OH(CHOH)_4COOH$, derived from talose.

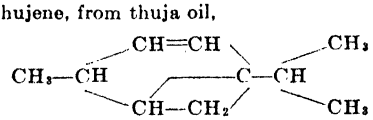
talose. $C_6H_{12}O_6$ = 180.1. An aldose or hexose, $CH_2OH(CHOH)_4CHO$, which occurs in two isomeric forms, d- and l-.

tamarac. The dried bark of the hackmetack, *Larix laricina* or *L. americana*, a larch tree of North America. Used medicinally, as the fluid extract, as an astringent and stimulant.

tamarind. The preserved pulp of the fruit of *Tamarindus indica*, a leguminous tree of India; used as a mild laxative.

tampicin. $C_{34}H_{54}O_{14}$ = 686.4. An amorphous resin obtained from tampico jalap, *Ipomoea simulans*, a Convolvulaceae.

tanacetene. $C_{10}H_{16}$ = 136.13. A terpene, b-thujene, from thuja oil,



tanacetin. $C_{11}H_{16}O_4$ = 212.1. A bitter principle from tanacetum. A brown, amorphous, hygroscopic mass, soluble in water or alcohol, insoluble in ether.

tanacetone. $C_{10}H_{16}O$ = 152.13. A ketone obtained from tansy oil, and apparently identical with thujone. A colorless liquid, b.195.

tanacetum. Tansy. The dried leaves and tops of *Tanacetum vulgare*, a Compositae of Asia, Europe and North America. **t. balsamita.** Costmary. The dried leaves and tops of *Tanacetum balsamita;* used as a vermifuge. **t. oil.** An essential oil distilled from tanacetum. It contains a terpene (tanacetene), a ketone (tanacetone), and alcohol (borneol); used medicinally as an anthelmintic. Cf. *silverweed.*

tanekaha. The bark of *Phyllocladus trichomanoides*, a Coniferae or pine tree of New Zealand; used in tanning and dyeing leather.

tané-koji. A grayish-brown powder from *Aspergillus oryzae*, a mold; used in the manufacture of saké.

tangent. The ratio of the side opposite the angle concerned to the base of the right-angled triangle in which it occurs.

tanghinia. The fruit of *Tanghinia venenifera*, an apocynaceous tree of Madagascar. Used as an ordeal bean, and contains a cardiac poison, tanghinine.

tanghinine. $C_{10}H_{16}N$ = 150.1. An alkaloid obtained from tanghinia. Colorless lustrous scales, soluble in alcohol, ether or acetic acid; it is a cardiac poison.

tang-kui. (1) Eumenol. (2) Lovage.

tangle. Laminaria.

tank culture. Hydroponics.

tankage. The rendered, dried, ground by-products from the slaughter of animals or from carcasses of animals. Used as fertilizer and feeding stuff: N, 5–10 %; $Ca_3(PO_4)_2$, 8–30 %. **fish-** q.v., **garbage-** The rendered, dried, ground product of waste household food materials: N, 2.5–3.5 %; P_2O_5, 2–5 %; K_2O, 0.5–1.0 %. **gashouse-** A misnomer for "spent oxide," consisting of iron oxide and the materials it has taken up in the purification of illuminating gas. It is often rich in nitrogen (5–10 %), but is poisonous to plants. **hynite-** A tankage with a high content of nitrogen. **process-** Hynite t.

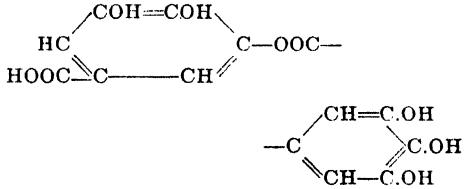
tannal. Aluminum tannate.

tannalbin. Tannin albumate. A light brown, odorless and tasteless powder, insoluble in water, alcohol or ether; used as an intestinal astringent.

tannase. An enzyme in various tannin-bearing plants; it hydrolyzes tannins to gallic acid.

tannate. A salt of tannic acid.

tannic acid. (1) $C_{14}H_{10}O_9$ = 322.2. Tannin. Gallotannic acid, digallic acid. A yellow amorphous powder or lustrous crystalline scales,



m.200 (decomp.), soluble in water, alcohol or glycerol, slightly soluble in ether. Used as a reagent and in the treatment of burns. (2) $C_{76}H_{52}O_{46}$. Gallotannin, Chinese tannin, Turkish tannin. A light yellow-brown powder from galls of oak, sumac, etc., soluble in water or alcohol. It is probably pentadigalloylglucose or a glucoside of polydigalloylgallic acids. **iodo-** See *iodotannic acid.*

tannigen. $C_{18}H_{14}O_{11}$ = 406.11. Acetannin, diacetyltannin, tannogen, tannin-diacetanilate, the acetic ester of tannic acid, $C_{14}H_8(COMe)_2O_9$. A light gray powder, insoluble in water, soluble

in alcohol; used medicinally as an intestinal astringent.

tannin. (1) Tannic acid. (2) The glucoside, pentadigalloylglucose, from nutgalls:

in which R represents tannic acid less the —OH of the carboxyl group. (3) See *tannins*. **acetyl-, diacetyl-** Tannigen. **iodo-** See *iodotannin*. **t. albumate.** Tannalbin.

tanning. The process of converting skins or hides into leather. **t. materials.** A group of native vegetable preparations that contain tannic acid:

TANNING MATERIALS

	*	
Anacardiaceae:		
Pistacio, *Pistacia* species	g.	30–40
Sumac, *Rhus copollina*	l.	17–38
White sumac, *Rhus glabra*	l.	15–25
Chinese galls, *Rhus semialata*	g.	70
Tizra sumac, *Rhus pentaphylla*	r.	29–31
Quebracho, *Schinopsis* species	e.	35–65
Apocynaceae:		
White quebracho, *Aspidiosperma* sp.	l.	27–30
Betulaceae:		
Birch, *Betula alba*	b.	3–18
Alder, *Alnus glutinosa*	b.	16–20
Minibari, *Alnus firma*	f.	25–28
Combretaceae:		
Dhaura, *Anogeissus latifolia*	l.	10–20
Myrobalan, *Terminalia chebula*	n.	30–40
Kumbuk, *Terminalia glabra*	b.	27–32
Thann, *Terminalia oliveri*	b.	30–35
Coniferae:		
Australian fir, *Callitris* sp	b.	17–31
Celery pine, *Phyllocladus* sp	b.	28–30
Larch, *Larix europoea*	b.	9–10
Western larch, *L. occidentalis*	b.	10–12
Hemlock, *Tsuga canadensis*	b.	7–16
Dipterocarpaceae:		
Ironwood, *Hopea* sp	b.	17–22
Pentacme suavis	l.	12–24;
	b.	7–13
White dammar, *Vateria indica*	f.	25
Euphorbiaceae:		
Cleistanthus collinus	b.	32–34
Amla, *Phyllanthus emblica*	f.	26–35;
	l.	23–28;
	b.	15–24
Fagaceae:		
Chestnut, *Castanea* sp	b.	6–8;
	w.	7–11
Live oak, *Quercus agrifolia*	b.	19
Valonia, *Quercus aegilops*	c.	30–65;
	a.	17–40
Turkey oak, *Quercus cerris*	g.	35
Aleppo oak, *Qu. infectoria*	g.	24–60
Common oak, *Qu. robur*	b.	9–12;
	w.	2–4
Red oak, *Qu. rubra*	g.	35;
	b.	4–6
Quercitron bark, *Q. tinctoria*	b.	25–30
Leguminosae:		
Angica, *Acacia angica*	b.	20–25
Babul, *A. arabica*	b.	12–20;
	p.	20–42
Black wattle, *A. binervata*	b.	30
Cutch, *A. catechu*	e.	60
Wattle, *A. decurrens*	b.	20–51
Green wattle, *A. microbotrya*	b.	12–47
Hickory, *A. penninervis*	b.	14–38
Golden wattle, *A. pycnantha*	b.	40–50
Bengal kino, *Butea frontosa*	e.	30–40
Algarobilla, *Caesalpinia brevofolia*	p.	43–67
Cascalote, *C. cacolaco*	p.	40–55
Divi-divi, *C. coriaria*	p.	30–50
Tari, *C. digyna*	p.	40–50
Guyacan, *C. melanocarpa*	p.	15–24
Tarwar, *Cassia auriculata*	b.	16–22
Elephant roots, *Elephantorrhiza*	r.	6–22
Timbo, *Enterolobium timbouva*	b.	22
Paypay, *Inga feullei*	p.	15–20
Ingagwazu, *I. offinis*	b.	26
Mimosa, *Mimosa pudica*	r.	10
Yhvihta, *Peltaphorum dubium*	b.	31
Kurupaih-ra, *Piptadenia rigida*	b.	28
Camanchile, *Pithecolobium dulce*	b.	15–25
Kino, *Pterocarpus* species	e.	45–60
Meliaceae:		
Piagao, *Xylocarpus granatum*	b.	21–48
Tabique, *X. obovatus*	b.	22–28
Kaatigua, *Trichilia* sp	b.	21–25
Myrtaceae:		
Mountain gum, *Eucalyptus alba*	b.	30
Ribbon gum, *E. amygdalina*	s.	58–65
Bloodwood, *E. corymbosa*	s.	28;
	l.	18
White mallet, *E. erythronema*	b.	30
Eucalyptus, *E. globulus*	s.	28
Spotted gum, *E. maculata*	s.	45
Black mallet, *E. occidentalis*	b.	40–50;
	l.	20–30
Mallet, *E. occidentalis*	b.	30–50
Messmate, *E. piperita*	s.	33–62
Moort, *E. platypus*	b.	25
Red ironbark, *E. siderophloia*	s.	35–73
Yhva, *Eugenia* species	b.	44;
	l.	15
Oak gum, *Spermolepsis* species	s.	43–80
Malpighiaceae:		
Tamwood, *Byrsonima* species	b.	22–40
Mangrutta, *Malpighia* species	b.	20–30
Palmae:		
Saw palmetto, *Sabal cerrulata*	l.	13
Polygonaceae:		
Canaigre, *Rumex* species	r.	25–30
Protaceae:		
Heath honeysuckle, *Banksia* species	b.	12–25
Sugarbush, *Protea* species	b.	15–25
Rhizophoraceae:		
Mangrove, *Braguiera* species	b.	22–52
Bahau, *Ceriops candolleana*	b.	25–43
Tangal, *C. tagal*	b.	24–37
Mangrove, *Rhizophora* species	b.	21–58;
	l.	22
Rosaceae:		
Tormentilla erecta	r.	20–46
Sapindaceae:		
Guara, *Paullinia sorbilis*	f.	43–55
Tamaricaceae:		
Tamarisk, *Tamarix species*	g.	26–58;
	l.	10
Punicaceae:		
Pomegranate; *Punica granatum*	f.	27–32;
	b.	20

* Approximate percentage of tannins in: a—acorns; b—bark; e—extract; f—fruit; g—galls; l—leaves; n—nuts; p—pods; r—root; s—secretions or sap; w—wood.

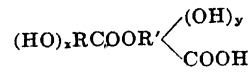
tannins. A group of astringent, aromatic, acidic compounds found in various plants and trees. They precipitate alkaloids, mercuric chloride, and heavy metals; form deep blue or black solutions (ink) with ferric solutions; and their strongly alkaline solutions absorb oxygen rapidly

The term should be restricted to the glucosides. The most common tannin is tannic acid. (See table of *tanning materials*.)

Types of tannins:

1. Hydrolyzable tannins, Ester-type RCOOR

a. Depsides or gallotannins,



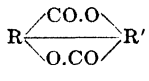
di-β-resorcylic acid	$C_{14}H_{10}O_7$
diprotocatechuic acid	$C_{14}H_{10}O_7$
digentisic acid	$C_{14}H_{10}O_7$
m-digallic acid	$C_{14}H_{10}O_9$
hamamelitannin	$C_{20}H_{20}O_{14}$
chebulinic acid	$C_{34}H_{30}O_{22}$
gallotannic acid	$C_{76}H_{52}O_{46}$

b. Glusides or galloylsugars,

$(HO)_xRCOOR'(OH)_y$

digalloyl-l-glucosan	$C_{20}H_{18}O_{13}$
trigalloyl glycerol	$C_{24}H_{20}O_{15}$
α-trigalloyl-l-glucosan	$C_{27}H_{22}O_{17}$
trigalloyl glucose	$C_{27}H_{24}O_{18}$
trigalloyl acetoneglucose	$C_{30}H_{28}O_{18}$
tetragalloyl erythrite	$C_{32}H_{26}O_{20}$
tetragalloyl methylglucoside	$C_{35}H_{30}O_{22}$
pentapyrogallol carbonyl glucose	$C_{41}H_{32}O_{26}$
pentagalloyl glucose	$C_{41}H_{32}O_{26}$
hexagalloyl mannite	$C_{48}H_{38}O_{30}$
penta-digalloyl-glucose	$C_{76}H_{52}O_{46}$

c. Ellagitannins or diphenylmethylolids,



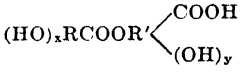
ellagic acid	$C_{14}H_6O_8$
cyanomaclurin	$C_{15}H_{12}O_6$
ellagitannin	$C_{20}H_{16}O_{13}$

2. Condensed tannins, Keto-type, R.CO.R

d. ketones, HOR.CO.R'

hydroxybenzophenone	$C_{13}H_{10}O_2$

e. Catecholtannins or phlobatannins,



maclurin	$C_{13}H_{10}O_6$
pinitannic acid	$C_{14}H_{16}O_8$
quinotannic acid	$C_{14}H_{16}O_9$
galitannic acid	$C_{14}H_{16}O_{10}$
ipecacuanhic acid	$C_{14}H_{18}O_7$
rubitannic acid	$C_{14}H_{22}O_{12}$
quercin	$C_{15}H_{12}O_9.2H_2O$
l-catechol	$C_{15}H_{14}O_6.3H_2O$
d-catechol	$C_{15}H_{14}O_6.4H_2O$
epicatechol	$C_{15}H_{14}O_6$
catechol carboxylic acid	$C_{16}H_{14}O_8$
pinicortannic acid	$C_{16}H_{18}O_{11}$
cola tannin	$C_{16}H_{20}O_8$
cocatannic acid	$C_{17}H_{22}O_{10}$
maletto tannin	$C_{19}H_{20}O_9$
hemlock tannin	$C_{20}H_{18}O_{10}$
quercitannic acid	$C_{20}H_{20}O_4$
sequoia tannin	$C_{21}H_{20}O_{10}$
tormentilla tannin	$C_{26}H_{22}O_{11}$
horse chestnut tannin	$C_{26}H_{24}O_{12}$
rheotannic acid	$C_{26}H_{26}O_{14}$
fraxitannic acid	$C_{26}H_{32}O_{14}$
cortepinitannic acid	$C_{32}H_{34}O_{17}$
paullinio tannin	$C_{38}H_{36}O_{20}$

tannoform. $C_{29}H_{20}O_{16}$ = 656.2. Methylene-ditannin, $(C_{14}H_9O_9)_2CH_2$. A condensation-product of formaldehyde and tannic acid. A pink powder, insoluble in water, soluble in alcohol or ether.

tannogen. Tannigen.

tannon. Tannopin.

tannopin. $C_{48}H_{42}O_{27}N_4$ = 1106.3. Hexamethyl-enetetraminetannin, tannon, urotropine-tannin, $(CH_2)_6N_4(C_{14}H_{10}O_9)_3$. A light-brown powder, insoluble in water or alcohol; used medicinally as an intestinal antiseptic and disinfectant.

tannyl. The monovalent radical, $—C_{14}H_9O_9$, derived from tannic acid. **t. acetate.** Tannigen.

tansy. Tanacetum. **wild-** Silverweed. **t. oil.** Tanacetum oil.

tantalate. A salt of tantalic acid of the type, $MTaO_3$. **hexa-** A salt of the type $M_8Ta_6O_{19}$. **peroxy-** A salt of the type M_8TaO_8.

tantalic acid. $HTaO_3$ = 230.5. Colorless crystals, insoluble in water, soluble in hydrofluoric acid. It forms complex salts; as, $Na_8Ta_6O_{19}$.

tantalite. $(FeMn)O.Ta_2O_4$. A native iron tantalate; black crystals, often found with niobium.

tantalites. A group of minerals of the type, $M(TaO_3)_2$, where M is divalent iron, or manganese. They are usually mixed with the corresponding columbites, $M(CbO_3)_2$.

tantalous. A compound of trivalent tantalum. **t. bromide.** See *tantalum bromide* (1). **t. chloride.** See *tantalum chloride* (1).

tantalum. Ta = 180.88. A rare metal of the vanadium family, and element, atomic number 73. It is a gray platinum-like metal, d.16.6, m.2850, insoluble in alkalis or acids, (except hydrofluoric acid). It occurs in tantalite and columbite and was discovered in 1802 by Ekeberg. The principal valency of Ta is five, but it also forms compounds containing trivalent tantalum. It is resistant to corrosion and is used as a substitute for platinum, for filaments in incandescent electric light bulbs, and as an electrode in current rectifiers for radio instruments; for surgical instruments, as it may be sterilized in the flame without losing hardness; and for rayon spinnerets, jewelry and laboratory ware. **t. bromides:** (1) $TaBr_3$ = 421.5. Tantalous bromide, t. tribromide. Yellow crystals, m.240, b.320, decomp. by water or alcohol. (2) $TaBr_5$ = 581.1. Tantalic bromide. A colorless powder, decomp. by water. **t. carbide.** TaC = 192.9. A hard, high melting-point solid. A mixture of 75 % TaC and 25 % HfC has the highest known melting point (above 4200°C). **t. chlorides.** (1) $TaCl_3$ = 287.88. Tantalous chloride. Yellow prismatic crystals, d.3,68, decomp. by water, soluble in sulfuric acid. (2) $TaCl_5$ = 359.0. Tantalic chloride. Light-yellow, crystalline needles, m.211, b.242, decomp. in moist air or water to tantalic acid; soluble in potassium hydroxide or absolute alcohol. **t. fluorides.** A group of double salts of the type, $(MF)_2TaF_5$, or, M_2TaF_7; M is a monovalent metal. **t. minerals.** Tantalum occurs in nature associated with columbium. Its principal ore is tantalite, $FeTa_2O_6$. **t. nitride.** TaN = 195.5. A colorless powder insoluble in water or acids, soluble in a mixture of HF and HNO_3. **t. oxide.** Ta_2O_5 = 443.0. Tantalic acid anhydride, t. pentoxide, tantalic oxide. A white, rhombic, crystalline powder, d.7.53; insoluble in water or alcohol, soluble in fused potassium bisulfate. **t. pentabromide.**

See *t. bromide* (2). **t. pentachloride.** See *t. chloride* (2). **t. pentoxide.** See *t. oxide.* **t. potassium fluoride.** K_2TaF_7 = 392.7. White silky needles; slightly soluble in water. **t. tribromide.** See *t. bromide* (1). **t. trichloride.** See *t. chloride* (1).

tantcopper. A copper alloy, analogous to tantiron.

tantiron. An acid-resistant alloy of iron containing silica, used for chemical equipment.

tantnickel. A nickel alloy analogous to tantiron.

tapioca. Cassava, manioca starch, Bahia arrowroot, Rio arrowroot, mandioc. The starch granules of the root of cassava, *Jatropha manihot*, an Euphorbiaceae of Brazil and the West Indies; used as food.

tar. A thick brown to black liquid with a distinctive odor, obtained by the distillation of wood, peat, coal, shale or other vegetable or mineral materials. It is a mixture of hydrocarbons and their derivatives. **coal-** A thick, black liquid obtained by the destructive distillation of bituminous coal or crude petroleum. It contains many aromatic hydrocarbons and phenols, including naphthalene, toluene, quinoline, aniline, cresols. Cf. *coal.* **oil of-** T. oil. **pine-** Wood tar. **rock-** Crude petroleum. **wood-** Pix liquida, pine tar. The empyreumatic syrup-like mass obtained by distillation of the wood of *Pinus* species. It contains resins, turpentine and oils; used as a disinfectant and antiseptic. On fractional distillation it yields an acid liquor (pyroligneous acid), empyreumatic oil (oil of tar) and a black residue (pitch).

t. camphor. Naphthalene. **t. oil.** Oleum picis rectificatum. The volatile oil from pine t, rectified by steam distillation, d. 0.862–0.872.

tarapacaite. Native potassium chromate.

taraxacerin. $C_8H_{16}O$ = 128.1. A ketone obtained from taraxacum.

taraxacum. Dandelion, lion's tooth. The dried rhizome and roots of *T. officinale*, a Compositae; used as a tonic and mild laxative.

taraxanthin. $C_{40}H_{56}O_4$ = 600.43. A carotenoid (q.v.) from dandelion flowers, m.184, an isomer of violaxanthin.

tarchonyl alcohol. $C_{50}H_{102}O$ = 718.79. An alcohol of the methanol series, m.82, insoluble in water, from the leaves of *Tarchonanthus camphoratus*, a Compositae of Africa.

tare. (1) The weight of a container in which a substance is to be weighed. (2) A counterweight used to balance a container. (3) A plant of the vetch family, grown for fodder. (4) Any weed that grows among corn. (5) Waste cloth wrappings, usually of jute, used for paper manufacture.

target. (1) Anticathode. (2) A substance exposed to bombardment by particles. Cf. *rays, radioelements.*

targusic acid. Lapachol.

tariric acid. $C_{18}H_{32}O_2$ = 280.3. 5-octadecynoic acid*, $Me(CH_2)_{10}C{:}C(CH_2)_4COOH$. An unsaturated acid, m.50.5; an isomer of linoleic acid occurring as glyceride in the fruit fats of Guatemalan tariri, seeds, from *Picramia* species.

tarnish. A surface film of a contrasting color formed on an exposed surface of a metal or mineral; it usually consists of the oxide or sulfide.

taro. The rhizome of *Colocasia esculenta*, an Araceae of the tropics whose poison is destroyed by boiling; used as food (poi).

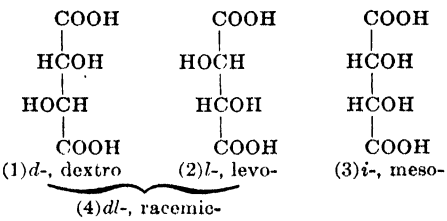
tarpaulin. (1) Canvas rendered waterproof by a coating of tar. (2) A waterproof cloth.

tarragon. The plant *Artemisia tranunguloides*, a Compositae; used as spice. **t. oil.** Estragon oil.

tartar. (1) Tatar. A crude potassium bitartrate which forms as sediment in wine casks. (2) Calculus. A deposit of saliva proteins and calcium phosphate on teeth, causing mechanical friction on gums which may lead to pyorrhea. **cream of-** Potassium bitartrate. **oil of-** A saturated solution of potassium carbonate. **salt of-** Potassium carbonate.

t. emetic. Potassium antimonyl tartrate.

tartaric acid. $C_4H_6O_6$ = 150.1. Dihydroxysuccinic acid, *2,3*-dihydroxybutanedioic acid*. A dibasic, tetratomic acid; 4 isomers:



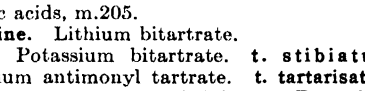
The common acid is *d-* and occurs in many vegetable tissues and fruits. **dextro-** or **levo-** Clear, colorless, monoclinic crystals, d.1.76, m.168, soluble in water or alcohol, insoluble in ether. Used as a reagent and in pharmaceutical preparations. **inactive-** Meso-. **levo-** See *dextro-*. **meso-** $+1H_2O$. Colorless scales, d.1.666, m.140, slightly soluble in water. **racemic-** $+1H_2O$. A mixture of dextro- and levotartaric acids, m.205.

tartarlithine. Lithium bitartrate.

tartarus. Potassium bitartrate. **t. stibiatus.** Potassium antimonyl tartrate. **t. tartarisatus.** Potassium tartrate. **t. vitriolatus.** Potassium sulfate.

tartrate. A salt of tartaric acid of the type, $M_2C_4H_4O_6$. **acid-** or **bi-.** A salt of the type, $MC_4H_5O_6$. **bi-** Acid-. **normal-** See *tartrate.* **pyro-** See *pyrotartrate.*

tartrazine. A yellow pyrazolone dye of the type,



Often used in foodstuffs.

tartronic acid. $C_3H_4O_5.\frac{1}{2}H_2O$ = 129.1. Oxymalonic acid, propanoldiacid, *2*-hydroxypropanedioic acid*, isopropanol diacid, COOH.CHOH.COOH. Colorless prisms, sublime 110, decomp. 186, m.185; soluble in water, alcohol or ether. **benzyl-** See *benzyltartronic acid.* **methyl-** Iso*malic acid.*

t. acid series. A group of polyhydroxy acids (q.v.) formed from carbohydrates; as

tartronic acid.....	$HOOC(CHOH)COOH$
tartaric acids.....	$HOOC(CHOH)_2COOH$
ribosic acids.....	$HOOC(CHOH)_3COOH$
saccharic acids.....	$HOOC(CHOH)_4COOH$

tartronyl. The bivalent radical, —CO.CHOH.CO—. **t. urea.** Dialuric acid.

taste. The sensation caused by a soluble substance on the nerves of the tongue. Classification:

acid	*e.g.*, hydrogen ions
sweet	*e.g.*, sugars
bitter	*e.g.*, strychnine
saline	*e.g.*, sodium chloride
metallic	*e.g.*, iron or copper salts
astringent	*e.g.*, alum
alkaline	taste of hydroxyl ions

The threshold values of taste stimulus for the four fundamental tastes are:

salty	0.25 gm. NaCl per 100 cc. H_2O
sweet	0.5 gm. sugar per 100 cc. H_2O
acid	0.007 gm. HCl per 100 cc. H_2O
bitter	0.00005 gm. quinine per 100 cc.

Cf. *odor*.

tatar. Tartar.

tau. The Greek letter τ (see under T).

taurine. $C_2H_7O_3NS$ = 125.14. Aminoethionic acid, aminoethylsulfonic acid, $NH_2.CH_2.CH_2.SO_3H$. Large monoclinic prisms, m.240 (decomposes), soluble in water insoluble in alcohol or ether; formed in bile by the hydrolysis of taurocholic acid.

taurocarbamic acid. $C_3H_8O_4N_2S$ = 168.15. $NH_2.CO.NH.CH_2.CH_2.SO_3H$. It occurs sometimes in urine.

aurocholeic acid. $C_{27}H_{47}NO_6S$ = 513.45. A bile acid (q.v.), which hydrolyses to choleic acid and taurine.

aurocholic acid. $C_{26}H_{45}O_7NS$ = 515.4. Choleic acid. An acid in bile. Colorless needles, soluble in water or alcohol, m.180; it hydrolyzes to taurine and cholic acid.

auryl. The monovalent radical, $NH_2.CH_2.CH_2SO_2$—.

taurylic acid. $C_7H_{14}O_2$ = 130.12. An acid occurring sometimes in urine.

tauto- A prefix indicating a tautomeric form of the substance it describes; as, tautohypoxanthine.

tautocyanate. An ester of the type R.N:CO.

tautomeric. Existing in a dynamic, isomeric state; describing a substance which can react in manners corresponding with two different structural arrangements of its atoms.

tautomerism. Dynamic allotropy. The property of certain substances of existing in a state of equilibrium between two isomeric forms, and being able to react according to either. It differs from the related types of metamerism and desmotropism (q.v.), because the two latter produce relatively stable compounds which react in accordance with a specified structure. The molecules may differ in L (the linkage, bond or connections between the atoms) and P (the position or distribution of these atoms in the molecule). Hence:

Tautomerism	L—different; P—different
Metamerism	L—alike; P—different
Desmotropism	L—different; P—alike

hence: R.CN and R.NC; R.ONO and $R.NO_2$; R.CO.NHR and R.C:NH.OR are tautomeric. The ketone-enol type of transformation is desmotropic. RNH.C:NR′, R′NH.C:NR are metamers. Cf. *desmotropes*. **electrolytic-** The phenomenon exhibited by an amphoteric substance in solution, which produces hydroxyl ions in presence of acids and hydrogen ions in presence of alkalis.

tautourea. $NH_2.C:NH.OH$, as distinct from $NH_2.CO.NH_2$ (urea).

tautouric acid. A tautomeric form of uric acid, q.v.

tawing. The tanning of hides with mineral substances; *e.g.*, alum, sodium chloride, chromium or aluminum salts.

taxicatin. $C_{13}H_{22}O_7.2H_2O$ = 326.2. A crystalline glucoside from the twigs of taxus.

taxine. $C_{37}H_{51}O_{10}N$ = 669.4. An alkaloid from the seeds and leaves of *Taxus baccata*. White scales, m.80, slightly soluble in water.

taxis. The movement of a cell in response to an external stimulus; as, chemotaxis, electro-taxis, photo-taxis.

taxus. Yew, chinwood. The poisonous dried seeds of *Taxus baccata*, a Taxaceae of Europe and Northern Africa.

Taylor, Hugh Stutt. 1890– . An English-born American chemist, noted for work in photochemistry and thermodynamics.

Taylor-White process. A method of toughening steel by heating it almost to fusion and cooling it in molten lead, followed by cooling in hot oil, reheating to 400–600°C. and cooling in air.

tazettine. $C_{18}H_{21}NO_5$ = 331.17. An alkaloid from the dried corm of *Narcissus tazetta*, related to sekisanine.

TB. An abbreviation for tuberculin.

Tb. The symbol for terbium.

Te. The symbol for tellurium.

tea. (1) A decoction or infusion of a medicinal plant. (2) The dried leaves of *Thea sinensis* and other species of China, Japan, India and other tropical countries. Average composition:

water	10 %
extractives	32.7 %
tannin	11.4 %
caffeine	1.9 %
ash	6.23 %
fibers	40–60 %

The following plants are used as tea:

(1) For medical use: (Cf. *species*).

Paronychia species	Algerian t.
Melaleuca species	Australian t.
Chenopodium anthelminticum	Mexican t.
Monarda species	Oswego t.
Gaultheria species	Salvador t.
Capraria species	West Indian t.

(2) As beverages:

Thea sinensis	Chinese t. (Pekoe, souchong, congou)
Catha edulis	Arabian t. (kat)
Stachy tarpheta species	Jamaica t.
Ledum palustre	Labrador t.
Ilex paraguensis	Paraquay t. (maté)
Neea theifera	Caparrosa t.

Brazil- Maté. **James-** See *Labrador t.* **Jesuits-** Maté. **Paraguay-** Maté.

t. berries. Gaultheria. **t. cup.** About 120 cc. or 4 fluid ounces. **t. root.** The root of *Ceanothus Americanus*, a Celastraceae, used as an astringent. Cf. *ceanothine*. **t. spoon.** About 4 cc. or 1 fluid drachm. **t. tree.** Cajeput.

teak. The extremely hard wood of *Tectona grandis*, (Verbenaceae) a tree of Southern Asia.

tear gases. A group of volatile lachrymatory compounds used in warfare. They are, in general, halogenated ketones of the type $RCO.CH_2X$, as chloroacetophenone; or halogenated cyanides, as PhCHBrCN, brombenzylcyanide. Cf. *poison gas*.

teas. (1) See *tea.* (2) See *species.*
tebelon. Isobutyloleate.
technic. (1) Technique. The details of a method of procedure. (2) The mechanical trades. **pyro-** The manufacture of fireworks.
technical. Pertaining to the manufacturing trades. **t. analysis.** The analytical methods employed in industry for the rapid evaluation of materials.
technique. Technic.
technology. A branch of science that deals with the methods of manufacturing materials from vegetable, animal or mineral sources.
Teclu burner. A modified bunsen burner the air and gas streams of which can be finely adjusted.
tecomin. Lapachol.
tecsol. A product of wood distillation, used as a denaturant for alcohol.
tegit. A trade name for molded asbestos and tar products used for electrical insulation.
Teichmann's crystals. See *hemin.*
teilungs koeffizient. Distribution coefficient.
tekite. A variety of meteorite.
telautograph. An instrument for directly transmitting sketches or writing.
tele- A prefix derived from the Greek "far off," indicating distance.
telekinesy. Action at a distance without contact.
telephan. [A better term than televox, which is a Greco-Latin hybrid.] An instrument in which sound waves of certain frequencies activate electrical relays, and so enables the operation of devices to be controlled by sounds.
telephone. An electrical instrument for transmitting sound.
telephotography. The transmission of black and white pictures by telegraphy or wireless (cf. *television*).
telescope. An optical instrument for observing distant objects; used in the laboratory for reading measuring scales at a distance.
television. See *telopsis, iconoscope.*
televox. Telephan.
telfairic acid. A fatty acid, d.0.9429, m.6, b.225, from East African gourd seeds, *Telfairia pedata*, a Cucurbitaceae; probably identical with linoleic acid.
tellerwort. Sanguinaria.
tellurate. A salt of telluric acid of the general type, M_2TeO_4, or M_6TeO_6.
tellur bismuth. Tetradymite. **t. nickel.** Melonite. **t. ocher.** TeO_2. Tellurium dioxide.
telluretted. An obsolete term for a compound containing divalent tellurium. **t. hydrogen.** Hydrogen telluride.
telluric. (1) Of earthly (as opposed to meteoric, or solar) origin. (2) Referring to hexa-valent tellurium. **t. acid.** H_2TeO_4 = 193.5. Allotelluric acid. A colorless powder, d.3.441, decomp. 160; insoluble in water, alcohol or alkalis. **soluble-** H_6TeO_6 or, $H_2TeO_4{,}2H_2O$ = 229.5. A white crystalline substance obtained by oxidation of tellurium dioxide.
t. bismuth. Tetradymite. **t. lead.** Nagyagite. **t. lines.** The lines in the solar spectrum due to absorption of rays by the atmosphere; as, Fraunhofer lines A and B. Their intensity varies with the altitude of the sun, and they do not show the Döppler shift. **t. ocher.** Tellurite. **t. silver.** Hessite.
telluride. (1) A binary compound containing divalent tellurium, of the general type, M_2Te. There are various native minerals:

hessite	Ag_2Te
altaite	PbTe
tetradymite	Bi_2Te_3

(2) Weissite. (3) An organic compound of the type R_2Te. **di-** Pertelluride. An organic compound of the type $R_2Te.Te.R$. **per-** Di-.
tellurinic acid*. A compound of the type $RTeO_2H$; as, methanetellurinic acid*, CH_3TeO_2H. Cf. *telluronic acid, sulfinic acid.*
tellurious. Tellurous.
tellurite. (1) Any salt of tellurous acid containing tetravalent tellurium of the general type, M_2TeO_3. (2) TeO_2. Telluric ocher. Native tellurium dioxide.
tellurium. Te = 127.61. Sylvanium. A nonmetal and element, atomic number 52. Amorphous rhombic crystals, d.6.25, m.451, b.1390, insoluble in water, soluble in concentrated sulfuric acid or alkalis. Te is a homolog of sulfur and selenium and forms several series of compounds:

	(inorganic compounds)		
valency:	−2	4	6
ion:	Te^{--}	TeO_3^{--}	TeO_4^{--}
name:	tellurides and tellurous	tellurites	tellurates and telluric
	(organic compounds)		
	R_2Te		R_2TeO
	R-tellurides		R-tellurium oxide

It was discovered by Müller in 1782 and occurs native as lionite, in tellurite and tellurides. **black-** (Pb,Au) (Te,S). A lead-gold mineral. **foliated-** Nagyagite. **graphic-** Sylvanite. **radio-** Polonium.
t. bichloride. See *t. chloride.* **t. bromides:** (1) $TeBr_2$ = 287.3. T. dibromide, tellurous bromide. Steel-gray needles, m.280, b.339, decomp. by water. (2) $TeBr_4$ = 447.25. T. tetrabromide, telluric bromide. A white powder, slightly soluble in water, and hydrolysed by it. **t. chlorides:** (1) $TeCl_2$ = 198.4. Tellurous chloride. t. dichloride. Black crystals, d.6.89, m.175, b.324; decomp. by water. (2) $TeCl_4$ = 269.3. Telluric chloride, t. tetrachloride. A white crystalline powder, m.224, b.380, decomp. by water. **t. dibromide.** T. bromide (1). **t. dichloride.** T. chloride (1). **t. diethyl.** $TeEt_2$ = 185.6. A liquid, b.137. **t. dimethyl.** $TeMe_2$ = 157.6. A liquid, b.182. **t. dioxide.** See *t. oxide.* **t. disulfide.** T. sulfide. **t. glance.** Nagyagite. **t. graphite.** (AgAu)Te_2. A native gold-silver telluride. Cf. *sylvanite.* **t. hydride.** Hydrogen telluride. **t. hydroxides:** (1) A group of organic compounds of the type, R_2TeOH. (2) The slightly basic tellurous acid, $TeO(OH)_2$. **t. iodide.** TeI_2 = 381.3. A black crystalline mass; insoluble in water. **t. lead.** An acid-resistant lead containing 0.05 % Te. It resists mechanical shock and stress reversal better than pure lead, and may be used with sulfuric acid of strength below 77 %. **t. monoxide.** See *t. oxide.* **t. nitrate.** $Te_2O_3(OH)NO_3$, derived from tellurous acid, $TeO(OH)_2$. **t. nitrates.** A group of organic compounds of the type $R_2Te(NO_3)_2$. **t. oxides:** (1) TeO = 143.5. T. monoxide, a rare compound. (2) TeO_2 = 159.5. T. dioxide. Yellow octahedral crystals, d.5.89, m.700, slightly soluble in water, soluble in alkalis. (3) TeO_3 = 175.5. T. trioxide. An orange colored powder, $d_{15°}$.5.07, decomp. at red-heat, insoluble in water, soluble in alkalis. (4) A

group of organic compounds of the type, R_2TeO; as, Me_2TeO, dimethyltellurium oxide. **t. oxychloride.** $TeOCl_2$, derived from tellurous acid. **t. sulfate.** $Te_2O_3SO_4$, derived from tellurous acid, $TeO(OH)_2$. **t. sulfide.** TeS_2 = 191.6. A black amorphous powder, insoluble in water or acids. **t. sulfite.** $(TeO_2)_2SO_3$, derived from tellurous acid. **t. sulfoxide.** $TeSO_3$ = 207.5. A compound formed by treating tellurium with concentrated sulfuric acid. **t. trioxide.** See *t. oxide.*

telluro- A prefix indicating the divalent atom, =Te. Cf. *sulfo-, seleno-.* **t. naphthene.** C_8H_6Te = 229.55.

t. pyran. C_5H_6Te = 193.55.

telluronic acid. A compound of the type $RTeO_3H$; as, methane telluronic acid*, CH_3TeO_3H. Cf. *tellurinic acid, sulfonic acid.*

telluronium. A compound of the type $R.TeH_3$. Cf. *selenonium.*

tellurous. Tellurious. Describing a compound which contains tetravalent tellurium. **t. acid.** H_2TeO_3 = 177.5. Tellurious acid. Colorless octahedral amphoteric crystals, d.3.053, decomp. 40, slightly soluble in water, alcohol or ether. Since: $H_2TeO_3 \rightleftharpoons TeO(OH)_2$, it forms a series of salts of the type M_2TeO_3, $M_2Te_2O_5$, $M_2Te_3O_7$ and $M_2Te_4O_9$; as well as a sulfate $TeO.SO_4$, nitrate, oxychloride, and oxybromide. **t. bromide.** See *tellurium bromide.* **t. chloride.** See *tellurium chloride* (1). **t. sulfate.** $Te(SO_4)_2$ = 319.64. A crystalline solid.

telluryl. The divalent radical =TeO, derived from tellurous acid, q.v.

telopsis. [A better term than television, which is a Greco-Latin hybrid.] The transmission of far-off events and moving scenes by telegraphy or radio (wireless). Cf. *radiovision.*

temperature. The intensity of heat or the degree of heat of a body, measured by a thermometer (q.v.) and expressed in °C. Cf. *quantity of heat, calorie.* The extremes of t. are:

TEMPERATURE MAGNITUDES.

Stellar interior	72,000,000°F	40,000,000°C
Stellar surface (B star)	41,000°F	23,000°C
Mercury lamp	25,200°F	14,000°C
Solar surface (G star)	10,800°F	6,000°C
Sun furnace (focus of 19 lenses)	10,000°F	5,500°C
Atomic hydrogen torch	7,600°F	4,200°C
Induction furnace (conductors)	7,200°F	4,000°C
Electric arc in vacuum	5,400°F	3,000°C
Stellar surface (M star)	5,400°F	3,000°C
Tungsten, melting point	5,350°F	2,970°C
Oxy-hydrogen torch	3,600°F	2,000°C
Gas burner	3,090°F	1,700°C
Rubrene, melting point	932°F	501°C
Water, boiling point	212°F	100°C
Hottest climate (Tripoli)	136.4°F	58°C
(Death Valley)	134.1°F	56.8°C
Man, body temperature	98.6°F	37°C
Ocean water (La Jolla)	78.4°F	25.7°C
Water, freezing point	32°F	0°C
Mercury, freezing point	−37.8°F	−38.8°C
Coldest climate (Alaska)	−82°F	−63.3°C
(Northern Siberia)	−87°F	−66.1°C
Liquid air	−319°F	−195°C
Interstellar space	−454°F	−270°C
Hydrogen freezes	−458°F	−272.2°C
Lowest experimental temperature	(0.75°A)	−272.38°C
Absolute zero	(0°A)	−273.13°C

(1°F-0.5556°C and 1°C-1.8°F)

absolute- T. as measured on, or calculated to the absolute thermometer scale; °A. which begins at −273°C. **color scale of-** See *color.* **critical-** The t. above which a gas can not be condensed to a liquid by pressure alone. **critical solution-** See *critical.* **flame-** See *flame temperature.* **maximum-** The t. above which life or growth of bacteria ceases. **normal-** (1) Room t. (2) The t. as measured on the hydrogen thermometer. (3) Standard- **optimum-** The t. most favorable for the action of an enzyme or the growth of an organism. **potential of-** Escaping tendency, q.v. **room-** The average t. of about 20°C. or 68°F. (293°A.). In England 15.5°C. or 60°F. **salt-** The t. at which crystals commence to separate when a solution is concentrated by boiling. **standard-** A t. of 0°C. or 273°A.

t. coefficient. A factor that indicates quantitatively the effect of t. on a property of matter; as of:

electrical conductivity	2.5 % per 1°C
chemical reactivity	2 to 3.5 % per 10°C

t. indicator. An electrical instrument consisting of a dial and galvanometer, which accurately measures the temperature. **t. reaction.** See *Maumené number.* **t. regulator.** Thermo-regulator. **t. recorder.** An electrical device for permanently recording the temperature at one or more locations. **t. scale.** See *thermometer scale.*

tempered. Subjected to repeated heatings; each of less intensity than the one before it. **t. steel.** A steel that has been hardened and subsequently heated again at a lower temperature.

tempering. (1) The reheating and cooling of metal; especially, a process for hardening steel. (2) Rendering plastic materials (such as clay) homogeneous. Cf. *annealing.* **t. oil.** A heavy, viscous oil used for cooling metals during the tempering process.

template. An outline of an article to be constructed, made in thin wood, paper or metal, to serve as a pattern or guide.

tempolabile. Describing a substance that changes in the course of time; as, certain biological liquids.

temulentine. $C_{12}H_{42}O_{19}N$ = 504.3. An alkaloid from the seeds of *Lolium temulentum*, the darnel grass associated with wheat.

temuline. $C_7H_{12}ON_2$ = 140.1. An alkaloid from lolium, q.v.

tenacity. Ability to hold fast, cf. *tensile strength.*

tenaculum. A hook-shaped dissecting needle.

tendering unit. A measure of the tendering of fabrics by chemical attack (*e.g.*, in laundering) in terms of the cuprammonium viscosity in reciprocal poises.

tengujo. Yoshino.

teniacide. An agent that kills tapeworms; as, aspidium.

teniafuge. An agent that expels tapeworms; as, spigelia, pomegranate.

tenite. Trade name for a cellulose aceto-butyrate plastic.

tenith. Trade name for a cellulose acetate plastic.

Tennant, Charles. 1768–1838. A Scotch industrial chemist noted for the original manufacture of chloride of lime.

Tennant, Smithson. 1761–1815. An English chemist noted for his discovery of iridium and osmium.

tennantite. $3Cu_2S.As_2S_3$. A native copper sulfarsenite, with iron.

tenorite. CuO. A native black oxide of copper.

tensile. Rigid. **t. strength.** Tenacity. The resistance which materials offer to a pulling action. It is measured by the breaking stress of the substance in dynes per sq. cm. Some t. s. (kg./sq. mm.) are:

flax fibers	60–110
steel	50–100
ramie fibers	70–80
rayon	60
copper	20–50
silk fibers	35–44
cotton fibers	28–44
rubber	15–20

tensimeter. An instrument used to determine transition points by measuring small vapor-pressure changes.

tensiometer. An apparatus for measuring surface tension, q.v.

tension. The stress caused by pulling or stretching; as, of rubber. **adhesion-** The degree of wetting of a solid by a liquid. **electric-** Electromotive force. **gaseous-** The elasticity of a gas. **surface-** The force exerted on the surface of a liquid, which causes the formation of a meniscus or the absence of froth. It is due to the unequal attractions exerted upon one another by the molecules near the surface, and in the liquid. **vapor-** See *vapor tension*.

tenth-meter. 10^{-10} m. or 1 Ångström unit.

tenth-normal solution. N/10 or 0.1 N, decinormal. A solution that contains 0.1 of the equivalent weight of a substance per liter.

tephigram. An entropy-temperature diagram.

tephroite. Mn_2SiO_4. A manganese silicate.

tephrosal. $C_{10}H_{16}O$ = 152.1. A volatile, liquid ketone from tephrosia; slightly soluble in water, soluble in alcohol, ether or benzene.

tephrosia. (1) Devil's shoe-string, Turkey pea. The dried leaves of *T. virginiana*, a Leguminosae; used medicinally as a cathartic. (2) Fish bean, uwuwa, ombwe. The leaves of *T. vogelii*, a Leguminosae of N. Rhodesia, used as fish poison and parasiticide.

tephrosin. $C_{23}H_{22}O_7$ = 410.15. Hydroxydequelin. A crystalline principle from *tephrosia*, *derris* and *cube*, q.v. Colorless, short, thick prisms, m.198, insoluble in water, soluble in alcohol, ether or glycerol.

ter- A prefix derived from the Latin indicating thrice or threefold. Cf. *tri-*.

teraconic acid. $C_7H_{10}O_4$ = 158.12. *2*-isopropylidene butanedioic acid*. The crystalline solid $Me_2C:C(COOH).CH_2COOH$, soluble in water, alcohol or ether, m.162 (decomp.).

teracrylic acid. $C_7H_{12}O_2$ = 128.09. *β,γ*-dimethylpentenic acid. A liquid, m.−18, b.218.

teratolite. A mixed, native oxide of iron and manganese, with decomposed feldspar.

terbium. Tb = 159.2. A rare earth metal and element, atomic number 65; discovered by Mosander in gadolinite. **t. chloride.** $TbCl_3$ = 265.6. A colorless, crystalline powder, readily soluble in water or alcohol. **t. hydroxide.** $Tb(OH)_3$ = 210.2. A colorless powder, soluble in dilute acids. **t. nitrate.** $Tb(NO_3)_3$ = 345.2. A white powder; soluble in water, decomp. by heat to Tb_2O_3. **t. oxide.** Tb_2O_3 = 366.4. An amorphous white powder, soluble in dilute acids. **t. sulfate.** $Tb_2(SO_4)_3$ = 606.5. Colorless crystals; soluble in water.

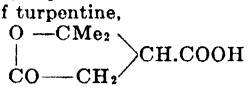
terchloride. Trichloride.

terebene. $C_{10}H_{16}$ = 136.18. A mixture of terpenes from turpentine. A yellowish, fragrant liquid, b.160–172, insoluble in water.

terebenthene. Turpentine.

terebentylic acid. $C_8H_{10}O_2$ = 138.12. A liquid, $d_0°$.0.87, b.160.

terebic acid. $C_7H_{10}O_4$ = 158.1. Terebinic acid, *2,2*-dimethyl paraconic acid. An oxidation-product of turpentine,



Colorless crystals, m.175. Cf. *terpenylic acid*. **pyro-** Pyroterebic acid.

terebinic acid. Terebic acid.

terebinthina. Turpentine.

terephthalal, terephthalyl. The tetravalent radical, =CH.C_6H_4.CH=.

terephthalic. Pertaining to p-phthalic acid. **t. acid.** $C_8H_6O_4$ = 166.1. Benzene-p-dicarboxylic acid, $C_6H_4(COOH)_2$. The para-isomer of phthalic acid. A white powder, sublimes when heated, insoluble in water, slightly soluble in alcohol; used as a reagent for alkali in wool. **t. aldehyde.** $C_8H_6O_2$ = 134.1. Benzene-p-dialdehyde, $C_6H_4(CHO)_2$. Colorless needles, m.-116, b.245; soluble in water or alcohol. **t. nitrile.** $C_8H_4N_2$ = 128.1. p-Dicyano-benzene, $C_6H_4(CN)_2$. Colorless crystals, m.215, insoluble in water, slightly soluble in alcohol or ether.

terephthalonic acid. Carboxyformyl benzoic acid.

terephthalyl alcohol. *α,α'-p*-Xylenediol.

teresantalic acid. $C_8H_{16}O_2$ = 143.1. An acid of the terpene series, in sandalwood oil.

tergitol. The trade name of a group of sodium or amine salts of higher primary or secondary alkyl sulfates having detergent properties.

terlinguarite. Hg_2ClO. A native oxychloride of mercury.

term. A mathematical relation. **D-** The diffuse lines in the spectrum. **P-** the principal lines in the spectrum. **S-** The sharp lines in the spectrum. See *hydrogen atom*, *orbits*, *atomic structure*, *series*, and *state*. **t. system.** See *quantum numbers*.

terminal. The end of an electric wire or electrode; or a binding post for it.

terminalia. Myrobalan.

terminology. (1) A branch of science that deals with the construction, definition and arrangement of names and terms. (2) A nomenclature. **Geneva-** See *Geneva*. **organic-** See *organic compounds*, *ring systems*, *radicals*, *structure symbols*.

termolecular. Trimolecular.

ternary. (1) Consisting of three. (2) Tertiary. **t. compound.** A molecule that consists of three different types of atoms. **t. steel.** A steel consisting of iron, carbon and one other metal. **t. system.** A system of three components.

ternitrate. Trinitrate.

teroxide. Trioxide.

terpadiene. A derivative of terpane (methane), containing two double bonds.

terpadienone. A derivative of terpanone containing two double bonds, generally $C_{10}H_{14}O$; as, carvone.

terpane. Methane.

terpanone. A saturated ketone, $C_{10}H_{18}O$, derived from terpenes; as, tetrahydrocarvone.

terpene. (1) A hydrocarbon of the general formula, $C_{10}H_{16}$, in essential oils, resins and other vegetable aromatic products. Classification:

A. *Monocyclic*—cymene-group, isomers of hexahydrocymene or menthane, limonene.

B. *Bicyclic*—carene, pinene, camphene group.

C. *Acyclic*—aliphatic terpenes.

Related to the terpenes are compounds with one-half, one and one-half, two or more times, the molecular weight of the terpenes. These are:

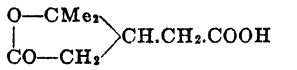
hemiterpenes	C_5H_8
as: pentadiene, isoprene.	
terpenes	$C_{10}H_{16}$
as: bornylene, camphene, carene, dipentene, fenchene, geranene, limonene, myrcene, ocimene, phellandrene, pinene, sabinene, sylvestrene, terpinene, thujene.	
sesquiterpenes	$C_{15}H_{24}$
as: cadinene, cannibene, caryophyllene, cedrene, clovene, guajene, patchoulene, santalene, selinene, zingiberene.	
diterpenes	$C_{20}H_{32}$
polyterpenes	$n(C_{10}H_{16})$

Cf. *projection nucleus, symmetry.* (2) A derivative of the related cyclic or unsaturated hydrocarbons, $C_{10}H_{14}$, $C_{10}H_{18}$ and $C_{10}H_{20}$; as, pinane, pinol, menthol, ionone. (3) $C_{10}H_{16}$ = 136.1. Dipentene, d.l.-limonene, cinene, cajeputene, kautchin, diamylene. A liquid hydrocarbon in the oils of bergamot, geranium, citronella, dill, caraway, wormseed and other essential oils. A colorless liquid, d.0.85, b.181, insoluble in water, alcohol or ether; used for flavoring purposes, as an anthelmintic, antispasmodic and anodyne. **t. dihydrochloride.** $C_{10}H_{16}.2HCl$ = 209.0. Dipentene dihydrochloride. A colorless crystalline substance, m.50; insoluble in water, soluble in alcohol, ether or benzene. **t. hydriodide.** $C_{10}H_{16}.HI$ = 264.1. Dipentene iodide, terpene iodide. A reddish-brown liquid; insoluble in water, soluble in alcohol, ether or benzene. **t. hydrochloride.** $C_{10}H_{16}.HCl$ = 172.6. Dipentene hydrochloride, pinene hydrochloride, artificial camphor, turpentine camphor. A colorless crystalline mass, m.125, b.208, insoluble in water, soluble in alcohol; used medicinally as an antiseptic.

terpenol. A group of cyclic alcohols, $C_{10}H_{17}OH$, derived from the terpenes; as, carvestrol.

terpenone. A group of ketones, $C_{10}H_{16}O$, derived from terpanones; as, dihydrocarvone.

terpenylic acid. $C_8H_{12}O_4$ = 172.1. An oxidation-product of turpentine and the monobasic acid.

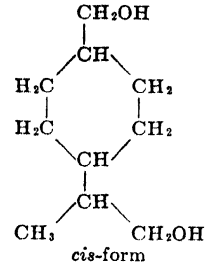


Colorless crystals, m. about 90 (see *terebic acid*).

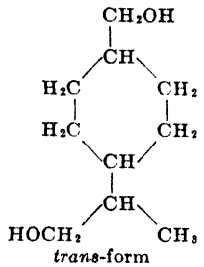
terpilene. $C_{10}H_{16}$ = 136.1. Terpinylene. A terpene obtained by dehydrating a terpene dihydrochloride solution. A clear liquid, d.0.852, b.176. **t. dihydrochloride.** Eucalyptole.

terpilenol. Terpineol.

terpin, terpine. $C_{10}H_{20}O_2$ = 172.2. Dipentene-glycol, dihydroxymenthane. A diatomic alcohol; two isomers:



cis-form
m.104
b.258

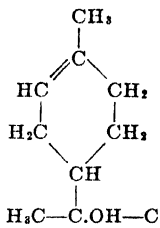


trans-form
m.156
b.263

t. hydrate. $C_{10}H_{20}O_2.H_2O$ = 190.23. Colorless rhombic crystals, m.106, b.258; soluble in water, alcohol or ether. It is obtained by oxidation of turpentine; used medicinally for whooping cough.

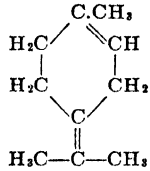
terpinene. $C_{10}H_{16}$ = 136.2. A hydrocarbon from turpentine. It exists in an alpha- and beta-form. A colorless liquid, d.0.865, b.179; insoluble in water, soluble in alcohol or ether.

terpineol. $C_{10}H_{18}O$ = 154.2. Lilacin, terpilenol. A clear, colorless liquid. (α-) d.0.936, m.35, b.219.8; (β-) d.0.923, m.33, b.210; (γ-) d.0.936, m.70, b.218; insoluble in water, soluble in alcohol or ether. It has a lilac odor; used in perfumery.



terpinol. A mixture of terpenes forming a colorless, oily liquid of hyacinth odor; insoluble in water, soluble in alcohol. Used as an antiseptic, in perfumery, soap manufacture, and medicinally.

terpinolene. $C_{10}H_{16}$ = 136.2. The hydrocarbon,



A colorless liquid, m.15, b.183; insoluble in water, soluble in alcohol, ether or glycerol. Cf. *citral, citronellal.*

terpinylene. Terpilene.

terpyridyl. 2.6-di-2′-pyridyl pyridine. A solution in HCl is a reagent for Co (orange color).

terra- A prefix indicating an earth or earthy origin. **t. alba.** A white clay or kaolin. **t. cariosa.** Rotten stone. **t. cotta.** A coarse clay or plastic earth, baked and used for decorative purposes or utensils. It is of better quality than brick. **t. rossa.** A fossil red earth. **t. japonica.** Pale catechu or gambir. **t. verde.** Green earth. A pale-green disintegration-product of hornblende minerals; used to fix basic dyes on textiles.

terracoles. A group of lichens.

terrein. $C_8H_{10}O_3$ = 154.0. A hydroxycyclopentanone produced by the mold *Aspergillus terreus.*

tersulfate. A sulfate containing three sulfate radicals.

tert-. An abbreviation and prefix indicating *tertiary.*

tertiary. Third in order or type. **t. alcohol.** An organic compound of the type, $R_3C.OH$. **t. amine.** An organic compound of the type, R_3N; as, trimethylamine Me_3N. **t. carbon atom.** A carbon atom that is attached to three other carbon atoms. **t. epoch.** A geologic period (q.v.) and system of strata deposited during the cenozoic era. **t. lipid.** See *lipids.* **t. phosphate.** The normal phosphate, M_3PO_4.

tervalent. Having three different valencies.

tesseral. Same as isometric or cubic (crystals). Cf. *crystal system.*

test. (1) A qualitative trial, or reaction, *e.g.*, for the identification of a substance. (2) A physical experiment designed to determine the physical properties of a substance or material. **biological-** A serum reaction. **generic-** q.v. **hot toddy-** An evaluation of: *aroma*, by treating 10 cc. liquors with 40 cc. hot water and lightly smelling it in comparison with a standard; *flavor*, sip and roll the liquid over the tongue without swallowing. If many tests are to be made chew an olive between tests and breathe fresh air. **layer-** Ring t. **load-** The subjection of a material to different pressures or weights and temperatures, and measurement of the resulting deformation. **negative-** q.v. **ordinal-** q.v. **ring-** A chemical reaction between two liquid layers, so that the reaction-products form a zone between them. **slag-** An examination of refractories for their behavior towards slag penetration. The slag should break from the walls cleanly. **spalling-** The behavior of heated materials after repeated quenching in water. **spot-** q.v. **streak-** q.v.

t. glass. Test tube. **t. meal.** See *test-meal.* **t. paper.** A filter paper impregnated with a solution of a reagent or an indicator (see table). Used to determine: (1) the presence of certain substances in a solution which must not be contaminated by the addition of the reagent itself; (2) the acid or basic character of a solution. **t. solution.** T.S. A solution of reagent. **t. tube.** A small cylindrical glass vessel of resistant glass; used for chemical reactions.

TEST PAPERS

Congo Red	with OH^- red, with H^+ blue (pH3–5)
Lead acetate	with H_2S black
Litmus blue	red with H^+
Litmus red	blue with OH^-
Litmus neutral	red with H^+, blue with OH^- (pH 4.5–8.3 sensitive to 0.001N)
Methyl orange	red with H^+, yellow with OH^-, pH 3.1–4.4
Nitrazine	at pH 4.5—yellow; 6.0—olive; 6.5—green; 7.5—blue.
Phenolphthalein	red with OH^-, white with H^+ pH 8.3–10
Potassium iodide	red with Hg salts
Potassium iodide-starch	blue with oxidizing agents
Starch	blue with iodine
Turmeric	red with OH^- (sensitive to 0.004N) or borates.

testa. A shell; as, testa ovi (egg shell).

testes. The dried substance of the testes of the steer; used medicinally for neurasthenia and diabetes.

test-meal. The specially-prepared food that is eaten, withdrawn from the stomach after a certain time, and then analyzed.

testosterone. A male sex hormone, m.154, from testis tissue, or synthesized. Cf. *androsterone, cholane derivatives.*

tetanics. A poison that chiefly affects the spinal cord and produces spasmodic contractions of the muscles; as, nux vomica, ignatia, thebaine.

tetanine. $C_{13}H_{30}O_4N_2$ = 288.2. A ptomaine from cultures of the tetanus bacillus.

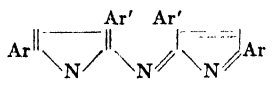
tetanotoxin. $C_6H_{11}N$ = 85.1. A ptomaine from cultures of the tetanus bacillus.

tetanthrene. $C_{14}H_{14}$ = 182.11. Tetrahydrophenanthrene, an aromatic hydrocarbon.

tetartohedral. A crystal form which exhibits only one quarter of the full number of faces required by the symmetry of the system.

tethelin. A principle obtained from the anterior lobe of the pituitary body. It is supposed to control the growth of an organism.

tetra- Quadri-. A prefix derived from the Greek, indicating "four." **t. arylazadipyrromethines.** Stable dyestuffs made by the progressive replacement of methine bridges in porphins to form azaporphins and finally phthalocyanines (q.v.): e.g.,



tetrabasic. Describing an acid that has four replaceable hydrogen atoms, as H_4SiO_4.

tetrabenzyl- A prefix indicating four benzyl radicals. **t. tin.** $Sn(CH_2Ph)_4$ = 482.92. Colorless prisms, m.42.5, insoluble in water, soluble in organic solvents.

tetraborane. B_4H_{10} = 53.3. A boron hydride, q.v.

tetraborate. A salt of tetraboric acid of the type, $M_2B_4O_7$; as, $Na_2B_4O_7$, borax or sodium tetraborate.

tetraboric acid. See *boric acid* (pyro-).

tetrabrom-, tetrabromo- A prefix describing a compound containing four bromine atoms in its molecule. **t. benzene.** 1.2.3.5- or 1.3.4.5-. $C_6H_2Br_4$ = 393.73. Soluble in ether, insoluble in alcohol, m.98.5, b.329. **t. cresol sulfonphthalein.** Bromcresol green. **t. ethane.** $C_2H_2Br_4$ = 345.8. Ethylene tetrabromide, $CHBr_2.CHBr_2$. A colorless liquid, d.2.972, m. −20, insoluble in water, soluble in alcohol or ether; used in organic synthesis. **t. fluorescein.** Eosin. **t. phenolsulfonphthalein.** Bromphenol blue.

tetracaine hydrochloride. Pontocaine, decicaine. The hydrochloride of 4-butylaminobenzoyl-β-dimethylaminoethanol, a local anesthetic.

tetracarboxylic acid. A tetrabasic organic acid containing four COOH radicals; as,
ethanetetracarboxylic acid, or dimalonic acid, $CH(COOH)_2.CH(COOH)_2$
propanetetracarboxylic acid, or methylenedimalonic acid, $CH(COOH)_2.CH_2.CH(COOH)_2$.
butanetetracarboxylic acid, or ethylenedimalonic acid, $CH(COOH)_2.CH_2.CH_2.CH(COOH)_2$

tetracetate. A compound containing four acetate radicals, $(CH_3COO)_4M$.

tetrachloro-, tetrachlor- A prefix describing a compound containing four chlorine atoms in its

molecule. **t. acetone.** $C_3H_2O.Cl_4$ = 195.86. Di-dichlormethyl-ketone, $(CHCl_2)_2CO$. Colorless crystals, m.48. **t. aniline.** $C_6HCl_4NH_2$ = 230.9. **2.3.4.5-** 1-Amino-tetrachlorobenzene. Colorless crystals, m.118; insoluble in water, soluble in alcohol or ether. **2.3.5.6-** m.90. **t. benzene.** $C_6H_2Cl_4$ = 215.9. **1.2.3.4-** Colorless needles, m.45, b.254; insoluble in water, soluble in alcohol or ether. **1.2.4.5-** Colorless monoclinic crystals, d.1.858, m.140, b.243; slightly soluble in water, soluble in alcohol or ether. **1.2.3.5-** White needles, m.50, b.246; insoluble in water, soluble in alcohol. **t. ethane.** $C_2H_2Cl_4$ = 167.87. Acetylenetetrachloride, ethylenetetrachloride. **1.1.2.2-** or *αα'ββ'*- CH_2Cl_2—CH_2Cl_2. A colorless liquid, d.1.600, m. −43.8, b.146.3, insoluble in water, miscible with alcohol or ether. Used as a solvent for fats and waxes, for airplane dope, for cleaning metals, as a paint remover, spotting agent, insecticide, and in organic synthesis. **1.1.1.2-** or *ααα'β'*- CH_2Cl—CCl_3. A colorless liquid, d.1.5825, b.129. **t. ethylene.** C_2Cl_4 = 165.84. Perchloroethylene. $CCl_2:CCl_2$. A colorless liquid, d.1.608, m. −19, b.119; insoluble in water, soluble in alcohol or ether. Used as a spotting and drying agent, soap solvent, and solvent for fats and waxes. **t. methane.** Carbon tetrachloride. **t. quinol.** Chloranil.

tetrachloride. A compound that contains four chlorine atoms in its molecule; as, $SnCl_4$.

tetracid. A base that contains four hydroxyl radicals; or an alcohol with four OH groups.

tetracol. Trade name for carbon tetrachloride.

tetracosane. $C_{24}H_{50}$ = 338.4. A hydrocarbon of the paraffin series. Colorless crystals, m.51; insoluble in water, soluble in alcohol or ether.

tetracosanic acid*. $C_{24}H_{48}O_2$ = 368.37. A fatty acid, m.84.2 from peanut oil. **iso-** A fatty acid, m.80, from Swedish pine oil.

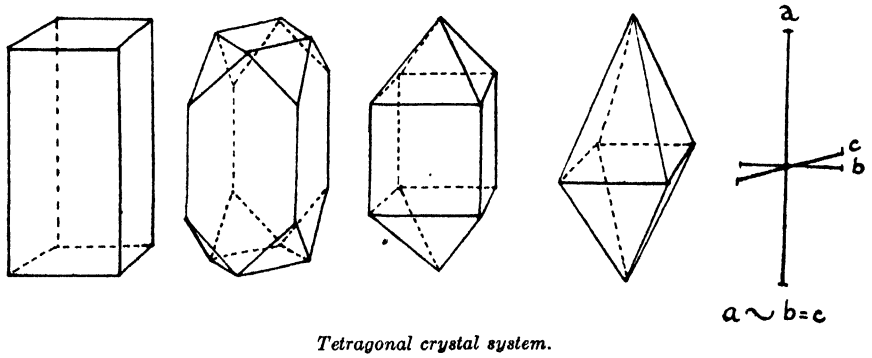
tetradymite. Bi_2Te_3. Tellurbismuth. A native bismuth telluride, which usually contains some sulfide.

tetraedrite. A native arsenic and copper sulfide, intermediate in composition between tennantite and tetrahedrite.

tetraethyl- A prefix describing a compound containing four ethyl groups in its molecule. **lead-** See tetraethyl *plumbane* and *tetraethyl gas*. **t. ammonium hydroxide.** $C_8H_{21}ON$ = 147.1. NEt_4OH. Colorless, hygroscopic, hairlike needles, m.50, soluble in water. Used medicinally as an antirheumatic or uric acid solvent. **t. ammonium iodide.** $C_8H_{20}NI$ = 257.2. NEt_4I. Yellowish crystals; soluble in water or alcohol. **t. benzene.** $C_{14}H_{22}$ = 190.2. The aliphatic-aromatic hydrocarbon $C_6H_2Et_4$. **1.2.3.4-** A colorless liquid, d.0.888, m.13, b.254; insoluble in water, soluble in alcohol, ether or benzene. **1.2.4.5-** A colorless liquid, d.0.887, b.250. **t. gas.** A "knockless" gasoline for automobiles, which contains a small amount of lead tetraethyl. Cf. *knock*. **t. germanium*.** $GeEt_4$ = 188.76. Colorless liquid, d.0.991, m. −90, b.163, insoluble in water. **t. lead*.** Tetraethyl *plumbane*. **t. tin*.** $SnEt_4$ = 234.86. Ethylstannane. Colorless liquid, d.1.187, m. −112, b.181, insoluble in water. **t. urea-** $C_9H_{20}ON_2$ = 172.18. $Et_2N.CO.NEt_2$. A colorless liquid, b.210; soluble in water or alcohol.

tetragalloyl- A prefix indicating four $C_6H_2(OH)_3CO$— radicals, from gallic acid. **t. erythrite.** $C_{32}H_{26}O_{20}$ = 730.2. $C_4H_6O_4[C_6H_2(OH)_3CO]_4$. White crystals, decomp. 308, slowly soluble in water, alcohol, or acetone.

tetragonal. Describing a crystal having its three axes at right angles to each other; two of the axes are of equal length, the third is shorter or longer (see illustration).



Tetragonal crystal system.

tetrad. (1) An atom or group of atoms that has a valency of four. (2) In crystallography: A crystal which exhibits four similar faces when rotated about its axis of symmetry through 360°.

tetradecane*. $C_{14}H_{30}$ = 198.24. A hydrocarbon of the methane series. A colorless liquid, d.0.765, m.5, b.253; insoluble in water, soluble in alcohol or ether.

tetradecanoic acid*. Myristic acid.

tetradecoic acid. Myristic acid.

tetradecyl. The monovalent radical, $—C_{14}H_{29}$, derived from tetradecane.

tetradecylene. $C_{14}H_{28}$ = 196.29. A hydrocarbon, soluble in alcohol, m. −12, $b._{15mm}$.127.

tetrahedral. Pertaining to a tetrahedron, cf. *tetrahedronal*.

tetrahedrite. Cu_2SbS_3, or $3Cu_2S.Sb_2O_3$. Panabase, fahlerz, gray copper ore. A native copper antimony sulfide. Cf. *aphthonite*, *schwatzite*, *tetraedrite*.

tetrahedron. A crystal of the isometric system, which has four equal faces; as, a pyramid.

tetrahedronal. Tetrahedral. Resembling a tetrahedron. **t. atom.** A static atom in which the electron octet is divided into four pairs of electrons which oscillate around centers located as the four corners of a tetrahedron. Cf. *Lewis atom*. **t. carbon.** A model of the C atom, generally used to illustrate the directions of the bonds; as,

single bond: tetrahedrons touching on corners; double bond: tetrahedrons touching on edge; triple bond: tetrahedrons touching on face; These correspond, respectively, with one, two, or three pairs of electrons held in common by the two C atoms.

tetrahexahedron. A crystal of the isometric system that has 24 equal faces; four on each face of a cube.

tetrahydro- A prefix describing a compound that contains four hydrogen atoms in excess of the formula indicated by its suffix-name. An unsaturated compound whose molecule has been saturated with four hydrogen atoms. **t. benzene.** C_6H_{10} = 82.11. $C_6H_6.H_4$. A colorless liquid, b.82. **t. benzoic acid.** See *benzoic acid*. **t. butene.** Tetramethylene. **t. furan.** Butylene oxide. **t. naphthalene.** Tetralin. **t. naphthol.** $C_{10}H_{12}O$ = 148.15. $C_6H_5.OH.(CH_2)_4$. A solid, m.69, b.$_{716mm}$.264, fairly soluble in water, very soluble in alcohol or ether. **t. naphthylamine.** $C_{10}H_{11}.NH_2$ = 147.2. *alpha-* aryl-. A colorless oil, b.277; soluble in alcohol. *beta-* acyl-. A colorless liquid, d.1.034, b.251; soluble in alcohol. **t. phenol.** $C_6H_{10}O$ = 98.11. $C_6H_9.OH.H_4$. A liquid, b.166, soluble in water. **t. quinoline.** $C_9H_{11}N$ = 133.1. A hydrogenation product of quinoline, $C_6H_4\langle^{NH—CH_2}_{CH_2—CH_2}$. A colorless crystalline mass or liquid, d.1.063, m.20, b.251, soluble in water, alcohol or ether; used in organic synthesis. *iso-* $C_6H_4\langle^{CH_2—NH}_{CH_2—CH_2}$. A yellow liquid, b.232; soluble in water, alcohol or ether. **t. thiazoles.** Thiazolidines. **t. tubanol.** q.v.

tetrahydroform. Trimethylenimine.

tetrahydroxy- A prefix that indicates four hydroxy groups. **t. benzene.** (1:2:4:5) $C_6H_2(OH)_4$ = 142.1. Colorless leaflets, m.215; soluble in water, alcohol or ether. **t. benzoic acid.** $C_6H(OH)_4COOH$ = 186.1. A solid, m.148. **t. quinone.** $C_6H_4O_6$ = 172.06. A soluble solid. **t. stearic acid.** $C_{18}H_{36}O_6$ = 348.4. Sativic acid. A white purgative powder in strophanthus oil.

tetraiodo- A prefix that indicates four iodine atoms. **t.-ethylene.** C_2I_4 = 531.73. CI_2:CI_2. An odorless, colorless, crystalline powder, m.187; used as an antiseptic. **t. phenolphthalein.** $C_{20}H_8I_4N_4Na$. A bluish powder, soluble in water; used as a radiopaque medium. **t. pyrrole.** Iodol.

-tetraketone. A suffix indicating four =CO groups; as, diphenyl t. Cf. *tetrone*.

tetrakis hexahedron. A form of the regular crystal system, (4-faced cube).

tetralin. $C_{10}H_{12}$ = 132.15. Tetrahydronaphthalene. A colorless liquid, d.0.917, b.205; insoluble in water, soluble in alcohol or ether. Used as a solvent for resins, waxes, fats and oils, as a substitute for turpentine, and in motor fuels. Cf. *dekalin*.

tetralite. Tetryl.

tetramethyl- A prefix that indicates the presence of four methyl groups. **t. ammonium.** A group of organic compounds of the type, $N(CH_3)_4X$; as,

$N(CH_3)_4Br$—t. bromide
$N(CH_3)_4Cl$—t. chloride
$N(CH_3)_4OH$—t. hydroxide
$N(CH_3)_4I$—t. iodide.

t. ammoniumformate. Forgenin. **t. ammoniumhydroxide.** NMe_4OH = 91.13. A soluble solid, decomp. by heat. **t. benzene.** $C_{10}H_{14}$ = 134.1. The hydrocarbon, $C_6H_2Me_4$. **1.2.3.4-** A colorless liquid, d.0.882, m.−4, b.204, insoluble in water, soluble in alcohol; it is an isomer of prehenitol. **1.2.4.5-** Durene. **6.1.2.4-** Isodurene. **1.2.3.5-** Isodurene. **t. diamino benzhydrol.** *Michler's hydrol*. **t. diaminobenzophenone.** See *Michler's ketone*. **t. diaminodiphenylmethane.** See under *diphenylmethane*. **t. diaminotriphenylmethane.** Leucomalachite green. **t. lead*.** $PbMe_4$ = 267.31. A colorless liquid, d.1.995, m.−27.5, b.110, insoluble in water. **t. oxamide.** $(CONMe)_2$. White crystals, m.80. **t. p-phenylene diamine.** Wurster's blue. **t. tin*.** $SnMe_4$ = 178.79. A colorless liquid, d.1.314, b.78, insoluble in water, soluble in organic solvents.

tetramethylene. (1) C_4H_8 = 56.06. Tetrahydrobutene. Cyclobutane, cyclotetramethylene, $CH_2\langle^{CH_2}_{CH_2}\rangle CH_2$. Many derivatives are known:

amino tetramethylene, $C_4H_7.NH_2$, b.81
hydroxy tetramethylene, $C_4H_7.OH$, b.123
methyl tetramethylene, $C_4H_7.Me$, b.39

(2) 1.4-butylene. The divalent radical, $—CH_2.CH_2.CH_2.CH_2—$; as, in
tetramethylene amine, $H(CH_2)_4NH_2$;
tetramethylene diamine, $NH_2—(CH_2)_4—NH_2$, putrescine.

(3) compound containing four CH_2== radicals. **t. amine.** Aminobutane. **t. diguanidine.** Arcaine. **t. glycol.** 1.4-Butanediol. **t. imine.** Pyrrolidine. **t. oxide.** Butylene oxide. **t. sulfide.** Butylene sulfide.

tetramethylethyleneketone. Pinacone.

tetramethylleucaniline. $C_{23}H_{27}N_3$ = 345.25. $(Me_2N.C_6H_4)_2CH.C_6H_4NH_2$. Lustrous crystals, m.151, soluble in alcohol; used in organic synthesis.

tetramethylmethane. C_5H_{12} = 72.1. *Tert.*-pentane, 2,2-dimethylpropane CMe_4. A colorless liquid, and isomer of pentane.

tetramethylurea. $C_5H_{12}ON_2$ = 116.1. $Me_2N.CO.N.Me_2$.

tetramido. Containing four amino groups and one or more oxygen atoms.

tetramine. An organic compound containing four amino nitrogens; as, hexamethylenetetramine, $(CH_2)_6(NH_4)$. Cf. *tetrammine, amines*.

tetramino- A prefix indicating the presence of four amino groups, $R(NH_3)_4$.

tetrammine. A metallic compound of the type $M(NH_3)_4X_3$, where M is a trivalent metal (as Co or Cr) and X a halogen. Cf. *tetramine, ammines*.

tetramolecular. A reaction of the fourth order, in which four molecules undergo a change.

tetramorphism. Crystallizing in four different crystal systems; as, phosphorus.

tetrandrine. (1) $C_{19}H_{23}NO_3$ = 313.19. An alkaloid, m.217 from *Stephania tetrandra*, a Menispermaceae. Cf. *codethyline*. (2) $C_{38}H_{42}O_6N_2$ = 622.3. An alkaloid from the Chinese drug hanfengchi.

tetrane. Butane.

tetranitrate. A compound containing four $—NO_3$ radicals; as, erythroltetranitrate.

tetranitro- A prefix indicating a compound containing four $—NO_2$ radicals. **t. aniline.** $C_6H_4N_5O_8$ = 273.06. T.N.A. $NH_2.C_6H(NO_2)_4$.

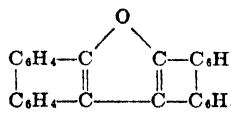
A high explosive, d.1.89, m.170, exploding at 237. **t. anthraquinone.** Aloetic acid. **t. chrysazin.** Chrysammic acid. **t. diphenyl.** $C_{12}H_6(NO_2)_4$ = 334.1. Colorless crystals, m.140, insoluble in water, soluble in alcohol or ether. It is used in organic synthesis. **t. diphenylmethane.** $C_{13}H_8(NO_2)_4$ = 348.2. Yellow prisms, m.172, insoluble in alcohol or ether; used in organic synthesis. **t. methane.** $C(NO_2)_4$ = 196.1. A colorless liquid, d.1.650, m.13, b.126 (decomp.), insoluble in water, soluble in alcohol or ether. It is a color reagent for unsaturation in organic compounds. **t. methylaniline.** Tetryl. **t. naphthalene.** $C_{10}H_4(NO_2)_4$ = 308.12. **1.4.5.8-** alpha-. Yellow rhombic crystals, m.257, explodes when further heated, slightly soluble in water, alcohol or ether. **1.3.6.8-** Long needles, m.203, explodes when further heated; insoluble in water. **1.3.5.8-** Yellow tetragonal crystals, m.194, soluble in water, alcohol or ether; used in organic synthesis. **t. phenol.** $C_6H(OH)(NO_2)_4$ = 274.1. 1-hydroxy-2.3.4.6-tetranitro-benzene. Yellow needles, m.130, explode when further heated; soluble in water, alcohol or ether. **t. phenosulfonphthalein.** A pH indicator changing from yellow (acid) to magenta (alkaline).

tetranitrol. Erythrol tetranitrate.

tetranthera. The bark of *Tetranthera citrata*, a Lauraceae.

tetraphenyl. Describing a compound containing four phenyl groups (—C_6H_5)$_4$, as, tetraphenylethane or lead tetraphenyl. **t. ethane.** $C_{26}H_{22}$ = 334.3. The hydrocarbon $\alpha\alpha'\beta\beta$-$CHPh_2$.-$CHPh_2$. Colorless crystalline needles, d.1.182, m.209, b.360; insoluble in water, soluble in alcohol, ether or acetic acid. **t. ethylene.** $C_{26}H_{20}$ = 332.2. The hydrocarbon Ph_2C:-CPh_2. Colorless monoclinic crystals, m.221, b.415; insoluble in water, soluble in alcohol or ether. **t. lead*.** $PbPh_4$ = 515.38. White needles, m.228, soluble in benzene. **t. methane.** $C_{25}H_{20}$ = 320.15. CPh_4. Colorless crystals, m.285, b.431. **t. silicon.** $C_{24}H_{20}Si$ = 336.2. The silane, $SiPh_4$. Colorless crystals, m.228, b.300; insoluble in water. **t. succinic acid.** $C_{28}H_{22}O_4$ = 422.2. Tetraphenylethanedicarboxylic acid, $Ph_2C(COOH).C(COOH)Ph_2$. Colorless crystals, m.261. **t. tin*** $SnPh_4$ = 426.86. Tetragonal crystals, d.1.490, m.226, insoluble in water, soluble in organic solvents. **t. urea.** $C_{25}H_{20}ON_2$ = 364.17. $Ph_2N.CO.NPh_2$. Colorless crystals, m.183; insoluble in water.

tetraphenylene. Describing a compound containing four phenylene groups, (=C_6H_4)$_4$; as, tetraphenylene furfurane. **t. furfurane.** $C_{28}H_{16}O_2$ = 368.2. The heptacyclic compound,

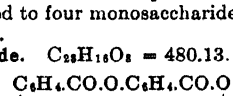


tetraphenyltin. See *tin tetraphenyl.*

tetraphosphorus monoselenide. P_4Se = 203.34. An insoluble solid, m.166.

tetrasaccharide. A carbohydrate which can be hydrolyzed to four monosaccharides; as lupeose, stachyose.

tetrasalicylide. $C_{28}H_{16}O_8$ = 480.13.



tetrasilane. Si_4H_{10} = 122.32. A hydride of silicon, $SiH_3.SiH_2.SiH_2.SiH_3$. An unstable liquid, m. —94, b.90.

tetrathionate. A salt of the type $M_2S_4O_6$; soluble in water, insoluble in alcohol.

tetrathionic acid. $H_2S_4O_6$ = 226.0. A polythionic acid obtained by the action of iodine on thiosulfates. When heated it decomposes into sulfuric acid, sulfur dioxide and sulfur. It can exist only in dilute solutions.

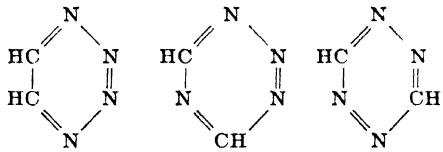
tetratomic. Describing: (1) A molecule consisting of four atoms, as, NH_3; (2) A compound that has in its molecule four hydroxyl groups, as, $M(OH)_4$ or $R(OH)_4$.

tetravalent. Describing an atom or group of atoms that has a valency of four. (Cf. *quadrivalent.*)

tetrazone*. A derivative of bihydrazine (q.v.) $H_2N.NH.NH.NH_2$. (See *tetrazone, tetrazo-*).

tetrazene*. A derivative of $NH:N.NH.NH_2$. Cf. *tetrazane.*

tetrazine. $C_2H_2N_4$ = 82.2. The heterocyclic compounds,

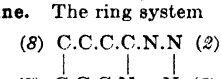


1.2.3.4- v- 1.2.3.5- a- 1.2.4.5- s-

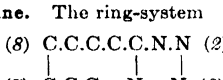
symmetric- Dark red prisms, m.99; insoluble in water, soluble in alcohol. **vicinal-** Ozotetrazone, known only in its derivatives.

tetrazo- Bisazo, bisdiazo. A prefix indicating a compound containing two azo groups, (—N:-N—)$_2$; as, bisdiazoamine (tetrazoamine), bisdiazohydrazine (tetrazohydrazine).

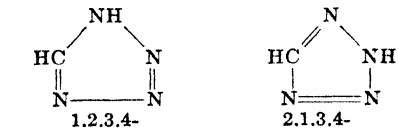
tetrazolazocine. The ring system



tetrazolazonine. The ring-system



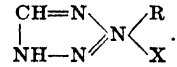
tetrazoles. CH_2N_4 = 70.06. The heterocyclic compounds,



1.2.3.4- 2.1.3.4- (or 1.2.3.5-)

Soluble in water, alcohol or ether, m.156 (sublimes). Two types of derivatives: **C-**, when the substituting radical is on the carbon atom; **N-**, when the substituting radical is on the nitrogen atom. **azo-** q.v. **benzo-** q.v. **bis-** q.v. **diazo-** q.v. **phenyl-** q.v. **pyrro-** q.v.

tetrazolium. A tetrazole derivative in which one nitrogen atom is pentavalent; as,



tetrazone. An organic compound of the type, $R_2N.N:N.NR_2$, obtained by the action of

yellow mercuric oxide on asymmetric dialkylhydrazines. They are strong reducing agents in an acid solution. Cf. vicinal *tetrazine*.

tetrazotic acid. $(CH_2)N_4$, known only in derivatives. Cf. *tetrazole, tetrazyl*.

tetrazyl. The monovalent radical, —HCN_4, derived from tetrazole. **t. hydrazine.** $CN_4.NH.NH_2$ = 99.08. Yellow crystals, m.199.

tetrinic acid. $C_5H_6O_3$ = 114.05. *α*-methyltetronic  . Colorless crystals, m 189. (Cf. *pentinic* and *hexinic acids*.)

tetrodonine. A curare-like poisonous principle, fugin, obtained from the roe of Japanese fishes of the genus, Tetrodon.

tetrole. Furan.

tetrolic acid. $C_4H_4O_2$ = 84.1. Butynoic acid*. The unsaturated acid MeC:C.COOH. Colorless leaflets, m.76, b.203; soluble in water, alcohol or ether. **t.a. series.** See *acetylene acids*.

tetronal. $C_9H_{20}S_2O_4$ = 256.3. Diethylsulfonediethylmethane, *3.3*-bisethylsulfonyl pentane*, $Et_2C(SO_2Et)_2$. Lustrous leaflets, m.85; slightly soluble in water, soluble in alcohol or ether. Used medicinally as a hypnotic and sedative, but it may cause hematoporphyrin to appear in urine.

-tetrone. A suffix indicating four=CO groups; as, anthracene t. Cf. *-tetraketone*.

tetronerythrin. A red pigment from the feathers of birds.

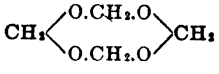
tetronic acid. $C_4H_4O_3$ = 100.03. The pentacyclic compound,  . Colorless crystals, m.141; soluble in alcohol. **ethyl-** Pentinic acid. **methyl-** Tetrinic acid. **propyl-** Hexinic acid.

tetrophan. Trade name for dihydro benzacridine carboxylic acid.

tetrose. $C_4H_8O_4$—. A group of monosaccharides that contain four carbon atoms. Four isomers:

d- and l-erythrose
d- and l-threose.

tetroxane. $C_4H_8O_4$ = 120.1. The heterocyclic compound,



tetroxide. A binary compound that contains four oxygen atoms.

tetryl. $C_7H_5N_5O_8$ = 287.08. Tetranitromethylaniline, methylnitropicramide, tetralite, *2.4.6*-trinitrophenylmethylnitramine, $(NO_2)_3C_6H_2NMe.NO_2$. Yellow powder, m.130, exploding 187. Used as an explosive in detonators, and as a primer for less sensitive explosives.

teucrin. $C_{31}H_{24}O_{11}$ = 452.2. A glucoside from germander, *Teucrium fruticans*, a labiate plant. Used in the treatment of tuberculosis.

teucrium. (1) Cat thyme, Syrian mastic. The dried herb of *Teucrium marum*, a Labiatae. It contains an essential oil, camphor, resin and glucoside. A sterilized extract is used in ampoule medication. (2) *T. chamaedris*. Germander, q.v. (3) *T. scordium*. Water *germander*.

textile. A woven cloth or fabric. **t. chemistry.** The methods of dyeing and finishing, and the chemical and microscopical examination of fabrics and yarns.

TEXTILES, SOLUBILITY

	Per cent solubility in			
	Acetone	NaOH	H_2SO_4	Calcium thiocyanate solution
Wool	0	100	0	3
Silk	0	100	0	100
Cotton	0	3.5	100	2
Cotton mercerized	0	3.5	10	2
Acetate rayon	100	6	100	100
Viscose rayon	0	6	100	100

texture. Coarse structure. *E.g.*, the arrangement of rock particles and crystals that gives a stone its physical appearance; or of fibers in textiles or paper.

tfol. An argillaceous earth containing gelatinous silica; used in North Africa as a substitute for soap. **t. ointment.** A mixture of 20 parts tfol and 100 parts tar; used medicinally as an antiseptic paste.

Th. The symbol for thorium. Th Ω. Hibernium. **ThEm.** Thoron. **ThX.** See *radioactive elements*.

thalenite. The mineral $2Y_2O_3,4SiO_2,H_2O$.

Thales of Miletus. About 640–546 B.C. A Greek philosopher noted for his attempt to find a single material cause for all things. To him is ascribed the saying that "Moisture is the principle of all life."

thalictrine. $C_{20}H_{27}O_4N$ = 345.2. An alkaloid obtained from *Thalictrum macrocarpum*, or *T. foliolosum* (Ranunculaceae). Colorless prismatic needles, m.208, insoluble in water and soluble in alcohol. It is a cardiac poison and laxative.

thalleoquine reaction. A test for alkaloids in which a characteristic color is obtained on adding in succession chloroform, bromine water and sodium hydroxide.

thallic. Describing a compound containing trivalent thallium, Tl^{+++}. (See *thallium compounds*.) **t. chloride.** Thallium chloride (2).

thalline. $C_{10}H_{13}ON$ = 163.2. Tetrahydro-p-quinanisol, tetrahydro-p-methoxyquinoline, $C_6H_4N(OMe).H_4$. Colorless rhombic crystals, m.40, soluble in water, alcohol or ether. It has a coumarin-like odor, and gives a deep green color with ferric chloride; hence its name (cf. *thallium*). **t. salicylate.** $C_{10}H_{13}ON.C_7H_6O_3$ = 301.2. Reddish crystals, soluble in alcohol. Used medicinally as an antiseptic and antipeptic. **t. sulfate.** $(C_{10}H_{13}ON)_2.H_2SO_4.2H_2O$ = 460.4. Colorless crystals, m.110; soluble in water or alcohol; used medicinally as an antiseptic and antipyretic. **t. tartrate.** $C_{10}H_{13}ON.C_4H_6O_6$ = 313.2. White crystals, m.155; soluble in water, slightly soluble in alcohol. Used medicinally as an antipeptic.

thallium. Tl = 204.39. A rare metal of the gallium-indium family, and element, atomic number 81. It is the lightest element having naturally-radioactive isotopes. Cf. *radioele-*

ments. A bluish-white metal, d.11.862, m.303.5, b.1280, insoluble in water, soluble in nitric acid. It was discovered in 1861 by Crookes and named from its green spectral line (Greek, thallein = green). It is widely distributed in nature, in small quantities, and is obtained from the lead chamber sludge by precipitation with zinc. Thallium forms two series of compounds, and has valencies of one and three:

Tl^{+}	Tl^{+++}
thallous-	thallic-

Its salts are all cumulative poisons. In its chemical properties it is analogous to the alkali metals, lead, and aluminum. The metal is used as a catalyst in the manufacture of azobenzene; as an antiknock compound; in optical glass; and as poison for ants and rodents. Principal sources:

crookesite (16–19 % Tl)..... $(Cu, Tl, Ag)_2Se$
lorandite (59–60 % Tl)..... $TlAsS_2$
hutchinsonite (18–25 % Tl).... $(Tl, Ag, Cu)_2S$
vrbaite (29–32 % Tl)..... $TlAs_2S_5$

t. acetate. $TlC_2H_3O_2$ = 263.4. Thallous acetate. Colorless hygroscopic crystals, d.-3.68, m.110, soluble in water. **t. alcoholate.** $TlOC_2H_5$ = 249.4. A saturated alcoholic solution of thallous oxide, d.3.55; the heaviest liquid known excepting mercury. **t. alloys.** A mixture of thallium and other metals. The m. of some thallium alloys are:

with	90 %Tl 10 %	80 %Tl 20 %	70 %Tl 30 %	60 %Tl 40 %	50 %Tl 50 %
Cd	235°C	210°C	230°C	245°C	258°C
K	305°C	208°C	240°C	220°C	215°C

t. alkyls. A group of organic compounds of the type, R_2TlX; as,

thallium diethylchloride..... Et_2TlCl,
thallium diethylhydroxide..... Et_2TlOH,
thallium diethyliodide..... Et_2TlI.

t. alum. $Tl_2SO_4,Al_2(SO_4)_3,24H_2O$ = 1279.64. Soluble white crystals. **t. amalgam.** An alloy of 8.5 % Tl and 91.5 % Hg, used in thermometers for low temperatures (−60°C.). **t. bromides:** (1) TlBr = 284.3. Thallous bromide. Colorless regular crystals, d.7.54, m.450; insoluble in water. (2) $TlBr_3$ = 444.1. Thallic bromide. Yellow needles, soluble in water or alcohol, decomp. by heat. **t. carbonate.** Tl_2CO_3 = 468.8. Thallous carbonate. Colorless monoclinic crystals, d.7.11, m.272 (decomp.); soluble in water, insoluble in ether. **t. chlorides:** (1) TlCl = 239.5. Thallous chloride. Colorless cubic crystals, d.7.02, m.429, b.720, slightly soluble in water or hydrochloric acid; it is used as a getter (q.v.) in tungsten lamps, and is more stable than $TlCl_3$. (2) $TlCl_3,-H_2O$ = 328.5. Thallic chloride. Thallium sesquichloride. A colorless, deliquescent, crystalline powder, occurring anhydrous or with 1, 4 and 7½ mol. of H_2O. Very soluble in water or alcohol, decomp. 100. **t. chloroplatinate.** Tl_2PtCl_6 = 816.54. A yellow, sparingly-soluble solid, analogous to K_2PtCl_6. **t. ethyl.** $TlEt_3$ = 291.39. An "anti-knock" compound. **t. fluosilicate.** $Tl_2SiF_6.2H_2O$ = 382.48. Six-sided plates, very soluble in water. **t. formate.** HCO_2Tl = 249.39. Thallous formate. Colorless liquid, used for mineralogical solutions. **t. formate- malonate.** A double salt, d.4.9, m.60, miscible with water; used as density liquid in mineralogy. Cf. *Clerici's solution.* **t. glass.** A variety of flint glass in which lead is replaced by thallium. It has a high refractive index. **t. hydroxides:** (1) TlOH = 221.4 ($+H_2O$). Thallous hydroxide. A pale yellow powder, soluble in water, alcohol or ether. It contains $1H_2O$ and is a strong base, decomp. 100. (2) $Tl(OH)_3$ = 255.4 or, TlO.(OH) = 237.4. Thallic hydroxide Tl. A dark orange powder, insoluble in water or caustic alkalis, soluble in acids or ammonium salt solutions; decomp. 100. **t. iodides:** (1) TlI = 331.31. Thallous iodide. A citron-yellow, crystalline powder, d.7.072, m.432, b.806; insoluble in water, alcohol or ether, soluble in aqua regia. (2) TlI_3 = 585.15. Thallic iodide. A yellow powder, slowly decomp. in air, soluble in alcohol or ether. **t. ions.** The monovalent Tl^{+} (thallous) or trivalent Tl^{+++} (thallic) ion. **t. mercurous nitrate.** A saturated solution, d.5.3, used for the separation of minerals. **t. nitrates:** (1) $TlNO_3$ = 266.2. Thallous nitrate. Colorless rhombic crystals, d.5.55, m.205, soluble in water or alcohol; used as a reagent and indicator, and in pyrotechnics for green fires. (2) $Tl(NO_3)_3 + 3H_2O$ = 444.4. Thallic nitrate. Colorless deliquescent crystals, decomp. 100. **t. oxides:** (1) Tl_2O = 424.8. Thallous oxide. A black powder, m.870, decomp. 1865; soluble in water, slightly soluble in alcohol. Used in the manufacture of flint, glass and artificial gems. (2) Tl_2O_3 = 456.8. Thallic oxide. A dark brown, hexagonal, crystalline powder, d_0°5.56, m.759, decomp. 875; insoluble in water and soluble in acids. The oxides TlO or Tl.O.Tl:O, and Tl_3O_5 also exist. **t. oxysulfide.** Tl_2SO. A light-sensitive substance used in photoelectric cells (thalofide cell). **t. ozone paper.** A filter-paper that has been impregnated with a solution of thallium hydroxide. It is colored brown by ozone. **t. peroxide.** T. oxide (2). **t. phosphate.** Tl_3PO_4 = 708.07. Thallous phosphate. Colorless needles, d.6.89; soluble in water or in ammonium salt solutions, insoluble in alcohol or ether. **t. sesquichloride.** Thallic chloride. **t. sulfates:** (1) Tl_2SO_4 = 504.8. Thallous sulfate. Colorless rhombic prisms, d.6.76, m.632, decomp. by further heat, soluble in water; used as a reagent. (2) $Tl_2(SO_4)_3,7H_2O$ = 823.1. Thallic sulfate. Colorless crystals; decomp. by heat, soluble in water. It forms double-salts of the type, $MTl(SO_4)_2$, not isomorphous with $TlAl(SO_4)_2$. Used as poison for rodents, and insecticide. **t. sulfides:** (1) Tl_2S = 440.8. Thallous sulfide. Black tetragonal, lustrous crystals, d.8.0, m.448 (decomp.); insoluble in water, alcohol or ether, soluble in acids. (2) Tl_2S_3 = 505.0. Thallic sulfide. A black mass, insoluble in water, decomp. by heat. **t. trioxide.** T. oxide (2).

thallochlor. The green coloring material of Iceland moss. It differs from chlorophyll.

thallofide cell. Thalofide cell.

thallophytes. A class of cryptogamous plants that includes algae, fungi and single-celled plants (bacteria, diatoms). Classification:

1. *Peridineae*	flagellates
2. *Cyanophyceae*	blue-green algae
3. *Chlorophyceae*	green algae
4. *Rhodophyceae*	red algae
5. *Phaeophycetes*	brown algae
6. *Diatomae*	diatoms
7. *Schizomycetes*	bacteria
8. *Phycomycetes*	algal fungi
9. *Myxomycetes*	slime molds
10. *Eumycetes*	fungi
11. *Characeae*	stone worts

thallous. Describing a compound of monovalent thallium. **t. compounds.** See *thallium*. **t. formate.** See *thallium formate*.

thalofide cell. A photoelectric cell in which thallium oxysulfide is the light-sensitive material; the ohmic resistance decreases when it is illuminated.

thalviol. Thujone.

thanatol. $C_8H_{10}O_2$ = 138.08. Guaethol, ajacol, pyrocatechin monoethylether, $C_6H_4(OEt)OH$, ethoxyhydroxybenzene. An oily liquid, m.27, b.215, insoluble in water, soluble in alcohol or ether; used medicinally.

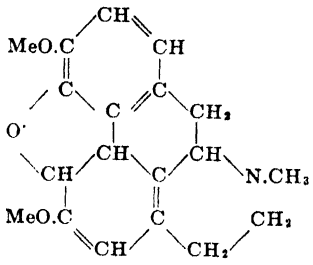
thapsic acid. A fatty acid, m.124 from *Thapsia garganica*, an Umbelliferae; insoluble in water, soluble in alcohol.

thawing. (1) The liquefaction of ice by heat. (2) The warming of frozen dynamite until it becomes soft and plastic.

thea. The Latin term for tea.

theamin. $C_7H_8N_4O_4.NH.C_2H_4OH$. Theophylline ethanolamine. A white powder, used as a diuretic and vasodilator.

thebaine. $C_{19}H_{21}O_3N$ = 311.3. Paramorphine, dimethylmorphine. An alkaloid from opium.



Colorless glistening prisms, m.193, slightly soluble in water, soluble in alcohol or ether. It is very poisonous; used medicinally similarly to strychnine. **methyl-** $C_{20}H_{23}O_3N$ = 325.3. An alkaloid from opium. Colorless crystals, insoluble in water.

t. hydrochloride. (Tbn)HCl.H_2O = 365.7. Colorless rhombic crystals, soluble in water; used in ampoule medication. **t. tartrate.** (Tbn)$C_4H_6O_6.H_2O$ = 479.36. A white crystalline powder, soluble in water or alcohol.

thebaol. $C_{16}H_{12}O_3$ = 253.1. *3.6*-Dimethoxy-*4*-hydroxyphenanthrene. A phenol from thebaine.

theelin. Oestrone.

theelol. Oestriol.

theetsee. A black varnish obtained by tapping the stems or trunks of *Melanorrhoea usitata*, an Anacardiaceae of Malaya.

theine. Caffeine.

thelophoric acid. $C_{20}H_{12}O_9$ = 396.1. A deep-red pigment from the fungus *Thelophora*, or from *Hydnum ferrugineum*.

ThEm. The symbol for thoron.

Thénard, Louis Jacques. 1777–1857. A French chemist, noted for his writings and the isolation of elementary boron. **T.'s blue.** The blue mass obtained by heating alum moistened with cobalt nitrate. It consists of cobalt aluminate, $Co(AlO_2)_2$, and its formation is used as a blowpipe test for aluminum.

thenardite. Na_2SO_4. A native sodium sulfate.

thenyl alcohol. Thiophene carbinol.

theobroma. (1) Cocoa. (2) A genus of plants, Sterculiaceae, that yield cacao. **oil of-** Cacao-butter.

theobromine. $C_7H_8O_2N_4$ = 180.1. Cacaine, 3.7-dimethylxanthine, 3.7-dimethyl-2.6-dioxypurine. An alkaloid from the leaves and seeds of *Theobroma* species; an isomer of theophylline and paraxanthine. A microcrystalline powder, m.337, slightly soluble in water or alcohol, soluble in ether. Used as its salts medicinally, as a diuretic and nerve stimulant. **iodo-** T. sodium iodide. **methyl-** Caffeine. **uro-** Paraxanthine.

t. acetylsalicylate. (Tbr)$C_9H_8O_4$ = 360.16. A white crystalline powder; insoluble in water, soluble in alcohol. **t. barium sodium salicylate.** Barutine. A white amorphous powder. **t. hydrochloride.** (Tbr)HCl = 215.6. White crystals, soluble in water; used medicinally as a nerve stimulant. **t. lithium.** $C_7H_7LiO_2N_4$ = 186.10. Theobromose. Uropherin. Colorless needles; soluble in water. **t. lithium benzoate.** $C_7H_7LiO_2N_4.LiC_7H_5O_2$ = 314.14. Uropherin-B. A white powder, soluble in water; used medicinally. **t. lithium salicylate.** $C_7H_7LiO_2N_4.LiC_7H_5O_3$ = 330.14. Uropherin-S. A colorless powder; soluble in water. **t. salicylate.** (Tbr)$C_7H_6O_3$ = 318.15. Fine white needles, slightly soluble in water; used medicinally. **t. sodium acetate.** $C_7H_7NaO_2N_4.NaC_2H_3O_2$ = 284.12. Theonacet, aguirin. A hygroscopic white powder, used medicinally. **t. sodium benzoate.** $C_7H_7NaO_2N_4.NaC_7H_5O_2$ = 346.14. A white crystalline powder; soluble in water. **t. sodium citrate.** $C_7H_7NaO_2N_4.Na_3C_6H_5O_7$ = 460.40. Urocitral. A white powder; soluble in water. **t. sodium formate.** $C_7H_7NaO_2N_4.NaCHO_2.H_2O$ = 288.12. Theophorine. A white powder; soluble in water. **t. sodium iodide.** $C_7H_7NaO_2N_4.NaI$ = 352.02. Eustenin, iodotheobromine, sodium iodotheobromate. A white hygroscopic powder; soluble in water.

theobromose. Theobrominelithium.

theocine. A brand of synthetic theophylline.

theodolite. An instrument for measuring angles in horizontal and vertical planes; used in surveying.

theoforine. Theobromine sodium formate.

theoline. C_7H_{16} = 100.1. An aromatic hydrocarbon from petroleum.

theonacete. Theobromine sodium acetate.

theophorine. Theobromine sodium formate.

theophylline. $C_7H_8O_2N_4.H_2O$ = 198.2. 1.3-Dimethylxanthine, 1.3-dimethyl-2.6-dioxypurine. An isomer of theobromine; an alkaloid from tea leaves. Colorless needles, m.264, slightly soluble in water, alcohol, or ether; used medicinally as a cardiac stimulant. **t. ethylene diamine.** Euphylline. A white crystalline powder; soluble in water. **t. sodium.** C_7H_7-

NaO_3N_4 = 202.3. Colorless crystals; soluble in water. **t. sodium formate.** $C_7H_7NaO_3N_4.NaCHO_2.H_2O$ = 288.4. Theophorine. An isomer of theoforine. A white powder, soluble in water.

theorem. Theory.

theory. The reduction of data or facts to a principle, and the demonstration of their interrelations. A doctrine or proposition capable of being demonstrated. **atomic-** See *atom.* **ionic-** See *ions, ionization.* **phlogiston-** See *phlogiston.* **quantum-** See *quanta, energy levels, orbits.* **side-chain-** See *Ehrlich theory.* **valency-** See *valency.*

theotannin. A tannin prepared from freshly-plucked, green tea leaves.

thephorine. Theophylline sodium formate. Cf. *theoforine.*

therapeutic. Pertaining to the art of healing. **t. agent.** A remedy or substance used to alleviate disease, pain or injuries. Therapeutic agents are classified according to their physiological actions:

I. *Internal remedies*
A. Affecting nutrition:—hematics, alkalis, acids, digestants, antipyretics, alteratives.
B. Affecting the nervous and muscular system:
(a) The brain:—cerebral excitants, cerebral depressants, narcotics, hypnotics, analgesics, anesthetics.
(b) The spinal cord:—motor excitants, motor depressants.
(c) Nerve centers and ganglionic systems:—antispasmodics, tonics, antiperiodics.
(d) Heart and circulatory system:—cardiac stimulants, cardiac sedatives, vascular stimulants, vascular sedatives.
(e) Excretories:—diuretics, renal depressants, vesical tonics, vesical sedatives, urinary sedatives, diaphoretics, sudorifics, anhidrotics, antilithics.
C. Affecting special organs:
(a) Organs of respiration:—expectorants, pulmonary sedatives, errhines, sternutatories.
(b) Alimentary canal:—sialagogues, emetics, purgatives, peristaltics, carminatives, astringents, stŏmachics.
(c) The liver:—hepatic stimulants, cholagogues, hepatic depressants.
(d) Generative system:—ecbolics, emmenagogues, aphrodisiacs, anaphrodisiacs.
(e) Eyes (ciliary muscle):—mydriatics, myotics.
II. *External remedies*
A. Irritants:
rubefacients, epispastics, pustulants, escharotics.
B. Local sedatives:
demulcents, emollients.
III. *Agents which act on organisms infecting the human body*
Antiseptics, disinfectants, antizymotics, anthelmintics, antiparasitics, antiperiodics.

t. index. The ratio: minimum fatal dose/minimum curative dose. *chemical-* The ratio: curative dose/tolerated dose.

therapeutics. The teaching of the use of remedial measures; the science and art of curing disease.

therapy. A system of treatment, as:

pharmacotherapy	action of drugs
specific chemotherapy	action of chemicals
immunotherapy	action of vaccines
organotherapy	action of glands

Cf. *aero t., atmo t., hydro t., electro t., radium t.*

therm. (1) *Metric.* Small calorie. (2) *British.* British Thermal Unit (B.Th.U.), q.v. It equals 251.9 calories, and is the heat-producing capacity of 200 cubic feet of standard supply gas.

thermae. Natural warm springs.

thermal. Pertaining to heat or temperature. **t. capacity.** The amount of heat necessary to change the unit mass of a body one degree centigrade; =M × spec. heat, where M is the mass. **t. conductivity.** The amount of heat that passes, in unit time, through a unit volume (one cubic centimeter) of a substance when the opposite faces of the cube differ by one degree centigrade. **t. constant.** The heat in calories evolved during a particular reaction. **t. death point.** The degree of temperature required to kill bacterial cultures when exposed for 10 minutes. **t. deformation.** Pyro-electricity. **t. energy.** Heat energy. **t. excitation.** The transition of an electron to an excited orbit, caused by an increase in temperature. According to Saha, the fraction, Y, of a gas which is excited at the absolute temperature, T, is $\log \frac{Y}{1-Y} = -\frac{5048E}{T}$, where E is the excitation potential. **t. expansion.** The increase of volume due to heat. It is relatively small for solids and liquids, but large for gases. **t. intensity.** Temperature. **t. ionization.** The loss of an electron by an atom due to an increase in temperature. The fraction, X, of an element which is ionized at absolute temperature, T, is (Saha):

$$\log \frac{X}{1-X} = -\frac{5048I}{T} + \frac{5}{2}\log T - \log p\epsilon - 6.5,$$

where I is the ionization potential and $p\epsilon$ the electron pressure in atmospheres. **t. radiations.** Heat radiations, q.v. **t. unit.** Therm.

thermel. Thermocouple.

thermic. Pertaining to heat.

thermifugin. $C_9H_8(CH_3N.COONa)_3$ = 404.1. Sodium methyltrihydroxyquinoline carbonate A pale yellow powder, soluble in water; used medicinally as an antipyretic.

thermin. $C_{10}H_{11}NH_2.HCl$ = 183.6. Tetrahydro-β-naphthylamine hydrochloride. Pale-rose, crystalline powder, m.237, soluble in water, alcohol or ether; used medicinally as a mydriatic.

thermion. The ions which carry current through a vacuum in a thermionic tube. They may be positive (positively-charged atoms), or negative (electrons).

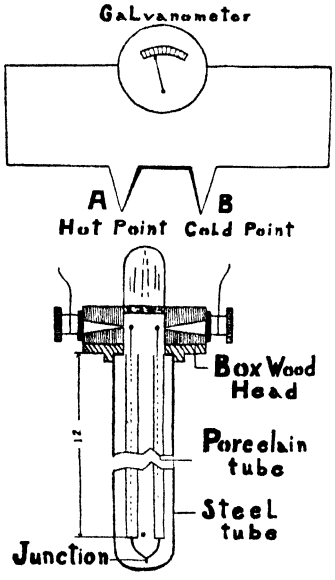
thermionic effect. The loss of electrons from a heated body maintained at an electric potential. It is the foundation of the thermionic valve or tube used for radio reception or transmission, and may be used to rectify or to amplify currents.

thermit(e). A mixture of aluminum and ferric oxide (Fe_3O_4). It is ignited by a primer (magnesium powder) and reacts violently

with liberation of heat and formation of aluminum oxide and molten iron. Used in the thermite process and incendiary bombs, and attains a temperature of about 3000°C. **t. process.** Goldschmidt's process. Thermo-reduction. (1) A method of obtaining a high temperature and molten iron by igniting a mixture of aluminum and ferric oxide; used in welding steel, rails, steam-ship shafts, etc. (2) A method of obtaining metallic chromium or manganese by mixing their oxides with powdered aluminum and igniting the mixture with a primer, the aluminum combining with the oxygen of the oxide to form Al_2O_3.

thermo- A prefix derived from the Greek, indicating "heat."

thermochemistry. The study of the relations of heat and chemical reactions. (See *thermodynamics.*)



Thermocouple.

thermocouple. Thermopile, thermel, thermoelement, thermojunction. A sensitive device for measuring temperature by the production of a thermo-electric current at the junction of two different metallic wires embedded in clay or porcelain. One wire is kept at constant low temperature, the other at the temperature to be measured.

Couple	Maximum temperature	E.M.F.
copper-constantan	500°C	25.54 millivolts
chromel-copel	550	
silver-constantan	600	32.50
iron-constantan	600	32.75
chromel-alumel	1200	
Pt—(*90%* Pt+*10%* Rh)	1600	18.00
Ni—nickel chrome	1090	41.80

By using a sensitive galvanometer and a t. of Bi and Sb wires the heat radiations from stars or planets are measured. Cf. *radiometer, pyrometer, bolometer.*

thermocross. Thermocouple.

thermodin. $C_{13}H_{17}O_4N$ = 251.2. Phenacetin urethane, acetyl-p-ethoxyphenylurethane, EtO.C_6H_4.N(COMe)COOEt. Colorless crystals, m.-87, slightly soluble in water; used medicinally as an antipyretic.

thermodynamic concentration. Activity. **t. potential.** Gibb's function, thermo-potential. "*The differential coefficient of the energy with respect to the variable expressing the quantity of the substance.*" (Gibbs.)

thermodynamics. The study, founded on experiment, of the empirical relations between heat energy and other forms of energy. **First law of-** *Conservation of energy;* "Heat and work are equivalent." Thus, a definite quantity of heat gives a fixed amount of mechanical energy; and, *vice versa*, a definite quantity of mechanical energy yields a fixed quantity of heat. This is also expressed by the statement that any change or transformation produced in a body is proportional to the *heat equivalent;* hence, the change in the energy content of a body depends on the difference between the original and final states, and is independent of any intermediate states. The maximum net amount of work obtained from a given process, changing at constant temperature and pressure from a higher to a lower state, is the *free energy.* **Second law of-** *Degradation of energy:* It is impossible, when unaided by any external agency, to convey heat from one body to another at a higher temperature; therefore in all changes, the *entropy* or amount of irreversible energy of the participating bodies increases. **Third law of-** Every substance has a finite positive entropy and, at absolute zero temperature, the entropy value is zero in the case of pure crystalline substances. Cf. *entropy.*

thermoelectric. Pertaining to electricity produced by heat. **t. current.** An electric current produced from a thermo-couple. **t. power.** The thermoelectromotive force produced at the junction of two metals by a temperature-difference between the two metals of one degree centigrade.

thermoelectromotive force. Thermoelectric power.

thermoelement. (1) Thermocouple. (2) Thermopile.

thermograph. A self-recording thermometer.

thermojunction. Thermocouple.

thermokalite. A mixture of trona, thenardite, thermonatrite and sodium bicarbonate.

thermolabile. Decomposed or destroyed by heat.

thermoluminescence. Luminescence caused by a slight increase in the temperature of a body, without the production of incandescence.

thermolysis. Dissociation or decomposition produced by heat.

thermomagnetic effect. A difference in magnetic properties caused by heat; as, the Leduc effect, Nernst effect.

thermometamorphism. A change in allotropic forms produced by heat.

thermometer. A device for determining the temperature or the intensity of heat of a body. Three types: *Mechanical-* Consists of a substance that expands and contracts with alterations of temperature.

Electrical- Involves measuring the change in or production of an electric current or resistance caused by a change of temperature; as, resistance thermometers, electrical thermocouples.

Optical- Involves examining the light of an

incandescent body; as, optical pyrometer, radiation thermometer.

THERMOMETERS

Classification according to Rimbach and Behar.

A. Indicating Thermometers (visible scales):

1. Liquid-in-glass (visible column)

mercury	− 38 to 540°C
pentane	−180 to 20°C
alcohol	− 70 to 120°C
thallium amalgam	− 60° to 100°C
gallium in quartz	31 to 1000°C

2. Pressure-spring (dials)

mercury expansion	− 38 to 530°C
non-mercury liquids	− 50 to 400°C
vapor pressure	− 30 to 370°C
gas filled	−130 to 540°C

3. Solid expansion

bimetallic	up to 550°C
metal and refractory	up to 650°C

4. Electrical resistance

nickel	−180 to 120°C
platinum	−180 to 1000°C

B. Indicating Pyrometers (graphic pointers):

1. Thermoelectrical

thermocouples	up to 1600°C

2. Optical

optical pyrometer	600 to 2500°C

3. Radiation

radiation pyrometers	500 to 2000°C

4. Fusion and melting

Seger cones	600 to 2000°C

C. Controlling thermometers (thermostats, q.v.)

angle- An L-shaped t. for insertion in the vertical side of a vessel. **armored-** A t. surrounded by a metal casing. **Beckmann-** See Beckmann. **kata-** q.v. **ultra-** Beckmann t.

t. conversion. To change a thermometer reading from one scale to another:

To change °C to °F—Multiply the °C by nine, divide by five, and add 32.

To change °F to °C—Subtract 32 from the °F, multiply by five and divide by nine.

t. scales:

(1) °C = degree centigrade or degree Celsius

$$t°C = \frac{9}{5}t + 32°F = \frac{4}{5}t°R = t + 273°A$$

(2) °F = degree Fahrenheit

$$t°F = \frac{5}{9}(t - 32)°C = \frac{4}{9}(t - 32)°R$$

(3) °R = degree Réaumur

$$t°R = \frac{5}{4}t°C = \frac{9}{4}t + 32°F = \frac{5}{4}t + 273°A$$

(4) °A = degree absolute

$$t°A = t - 273°C$$

thermonatrite. $Na_2CO_3.H_2O$. A native monohydrated sodium carbonate.

thermoneutrality. The absence of a heat change when dilute solutions of neutral salts are mixed, and no precipitate forms.

thermonuclear reaction. A reaction which proceeds at high temperatures (*e.g.*, in the interior of a star) and results in transmutation of elements by bombardment by α-particles, protons, electrons, etc.

thermophore. A device for retaining or holding heat; as, a hot water bag.

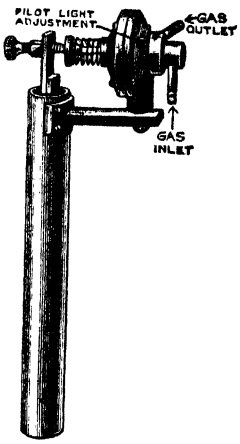
thermopile. A thermoelement which consists of a series of soldered metal plates or bars arranged in series so as to produce a cumulative effect; when heated at their junctions an electric current results.

thermoplastic. Rendered soft and moldable by the action of heat. Cf. *plastics.*

thermopotential. Thermodynamic potential.

thermoreduction. Thermite process.

thermoregulator. A device for mechanically regulating temperature by controlling the source of heat. (See *thermostats* and illustration.)



Thermoregulator for gas-heated thermostats.

thermosetting. Rendered hard by heat; as, certain plastics q.v.

thermostabile, thermostable. (1) Refractory or heat-resisting. (2) In biochemistry; not affected by temperatures above 55°C, or below 100°C.

thermostat. A device for regulating the heat of an oven, incubator, retort or other apparatus automatically.

thermotaxy. (1) A form of orthotaxy (q.v.) produced by the influence of heat. (2) The directional tendency of regular groupings in crystalline substances due to heat.

thermotension. The subjection of a red-hot metal to high tensile stress during cooling.

thermotropic. Caloritropic. Stimulated by or responding to a change of temperature.

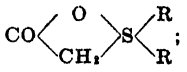
thermsilid. An acid-resisting alloy of 84 % iron and 16 % silicon.

°C	°F	°R	°A	°C	°F	°R	°A	°C	°F	°R	°A	°C	°F	°R	°A
1000	1832	800	1273	45	113	36	318	95	203	76	368	−5	23	−4	268
900	1652	740	1173	40	104	32	313	90	194	72	363	−10	14	−8	263
800	1472	640	1073	35	95	28	308	85	185	68	358	−15	5	−12	258
700	1292	560	973	30	86	24	303	80	176	64	353	−17.8	0	−14.2	255.2
600	1112	480	873	25	77	20	298	75	167	60	348	−20	−4	−16	253
500	932	400	773	20	68	16	293					−30	−22	−24	243
400	752	320	673	15	59	12	288	70	158	56	343	−40	−40	−32	233
300	572	240	573	10	50	8	283	65	149	52	338	−50	−58	−40	223
200	392	160	473	5	41	4	278	60	140	48	333	−100	−148	−80	173
150	302	120	423	0	32	0	273	55	131	44	328	−200	−328	−160	73
100	212	80	373	−1	30.2	−0.8	272	50	122	40	323	−273	−459.4	−218.4	0

Besides these common scales there are: (5) °K = degree Kelvin, practically the same as °A. (6) °Ra = degree Rankine, which is absolute Fahrenheit or °F based on absolute zero: −459°F = 0°Ra, 0°F = 459°Ra, 212°F = 671°Ra.

theta. The Greek letter *θ*, Θ. See *T*.

thetine. Thiobetaine, sulfinate. A group of organic compounds derived from the heterocyclic compound,



e.g., dimethylthetine, where R is —CH_3. **dimethyl-** $OSMe_2.CH_2.CO$ = 120.12. ***2.2*-dihydro-*2.2*-dimethyl-*1.2*-oxathietan-*4*-one.** Deliquescent crystals, decomp. by heat.

theveresin. $C_{48}H_{70}O_{17}$ = 918.7. A white amorphous powder; a split-product of thevetin.

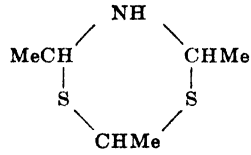
thevetin. $C_{54}H_{48}O_{24}$ = 1100.5. A crystalline glucoside from the seeds of yellow oleander, *Thevetia neriifolia*, an Apocynaceae of Central America. Small colorless crystals, m.215, $[\alpha]_D$ −39.2°, slightly soluble in water, soluble in alcohol. Cf. *theveresin*.

thiacetamide. Thioacetamide.

thiacetic. Thioacetic acid.

-thial*. The suffix for a thioaldehyde; as, ethanethial*, CH_3CHS.

thialdine. $C_6H_{13}NS_2$ = 163.26.

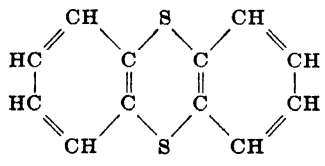


Colorless crystals, d.1.92, m.43 (decomp.)-soluble in water, alcohol or ether; used medicinally as a heart stimulant.

thiamide. An organic compound of the type, R—C:S.(NH_2). **iso-** An organic compound of the type, R—C:NH.(SH).

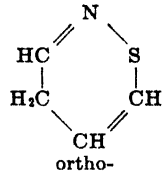
thiamin(e). Vitamin B_1.

thianthrene. $C_{12}H_8S_2$ = 216.24. Diphenylene disulfide, dibenzo-*p*-dithiin. The heterocyclic compound,

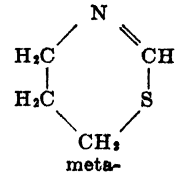


m.159, b.365; insoluble in water, soluble in alcohol or ether.

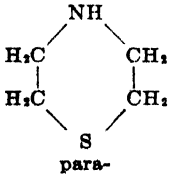
thiazine. A group of sulfur-containing heterocyclic compounds:



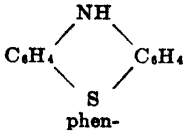
ortho-



meta-

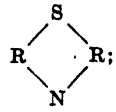


para-



phen-

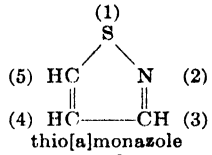
Cf. *benzo-t.*, *benziso-t.*, *pheno-t.* **t. dyes.** A group of aniline dyes derived from thiazines and containing the grouping,



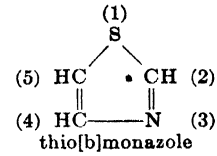
as in thionine, toluidine blue, methylene blue, methylene violet.

thiazole. C_3H_3NS = 85.1. Metathiazole, thio[o]-monazole. A colorless liquid, d.1.200, b.117; insoluble in alcohol, soluble in ether. **t. purple.** $C_{19}H_{17}BrN_2S_2$. A carbocyanine dye: *1.1'*-dimethyl thiocarbocyanine bromide, used as photographic sensitizer.

thiazoles. A group of organic compounds derived from:



thio[a]monazole or **ortho-**



thio[b]monazole or **meta-**

The derivatives are named according to position; thus:

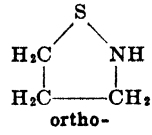
1—s—(sulfur)	1—s—(sulfur-)
2—n—(nitrogen)	2—μ—(median-)
3—γ—(gamma)	3—n—(nitrogen-)
4—β—(beta)	4—β—(beta-)
5—α—(alpha)	5—α—(alpha-)

as in

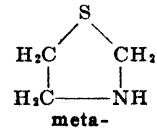
μ-amidothiazole, $C_3H_2NS.NH_2$	m.90
α-methylthiazole, $C_3H_2NS.Me$	b.232
μ-methylthiazole	b.128
$\alpha\mu$-dimethylthiazole, C_3HNSMe_2	b.143
trimethylthiazole, C_3NSMe_3	m.167

dihydro- Thiazoline. **tetrahydro-** Thiazolidine.

thiazolidine. C_3H_7NS = 89.1. Tetrahydrothiazoles. The saturated heterocyclic compounds:



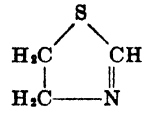
ortho-



meta-

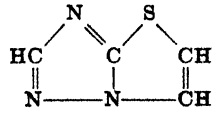
4-keto-2-thio-m- Rhodamine.

thiazoline. C_3H_5NS = 87.1. Dihydrothiazoles. A group of organic compounds derived from the heterocyclic compound,



μ-methylthiazoline, C_3H_4NSMe	b.145
μ-phenylthiazoline, C_3H_4NSPh	b.276

thiazoltriazol. $C_4H_3N_3S$ = 125.1. The heterocyclic compound,

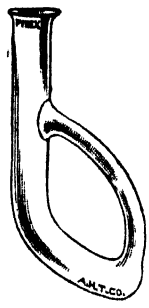


thiazyl. (1) The monovalent radical, C_3H_2NS—, derived from thiazole. (2) The monovalent N_3S_4— radical. **t. chloride.** N_3S_4Cl = 205.77. **t. nitrate.** $N_3S_4NO_3$ = 232.32.

thicken. (1) To evaporate to a greater viscosity. (2) To expand the ends of a metal rod.

thickness. (1) The degree of viscosity or fluidity. (2) The width of a plate. (3) The radius or gage of a wire.

Thiele tube. A specially-shaped test-tube (see illustration) which if heated at the base insures the circulation of the liquid in it, and thus, an even distribution of heat. Used in making melting-point determinations, a melting-point tube and thermometer being inserted in it.

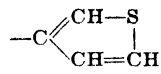


Thiele tube.

Thiel-Stoll solution. A saturated solution of lead perchlorate, $Pb(ClO_4)_2$, d.2.6; used for determining the specific gravity of minerals by the suspension method.

thienone. Thienylketone. **aceto-** Thienylmethylketone.

thienyl. The monovalent radical, —C_4H_3S, derived from thiophen:



t. diphenylmethane. $C_{17}H_{14}S$ = 250.1. $(C_4H_3S)CHPh_2$. Colorless crystals, m.63, b.335; soluble in alcohol. **t. ketone.** $C_9H_6OS_2$ = 194.17. Thienone, *2.2'*-dithienylketone, $(C_4H_3S)_2CO$. White needles, m.87, b.326, insoluble in water. **t. methylketone.** C_6H_6OS = 126.1. Acetothienone. $(C_4H_3S)COMe$. A colorless liquid, b.213. **t. phenylketone.** $C_{11}H_8OS$ = 188.1. $(C_4H_3S)COPh$. Colorless crystals, m.55, b.360; soluble in alcohol.

Thies process. A method of extracting gold from ores by adding chloride of lime and sulfuric acid to the crushed ore.

thigenol. A registered trade-mark for sodium sulfo-oleate solution, an antiseptic.

thimble. A porous cup made of filter paper or alundum, used for extracting materials, *e.g.*, in a Soxhlet apparatus.

thinner. A liquid which is used to thin out or dilute a solution of a paint or lacquer, but which is not itself necessarily a solvent for it (cf. *vehicle*).

thinolite. A tufa or native calcium carbonate, forming layers of interlaced crystals. It occurs in Nevada and California in large deposits.

thio- A prefix derived from the Greek "theion" —sulfur. It indicates the replacement of oxygen in an acid radical by sulfur having a negative valence of two. Cf. *sulfo-*.

thioacetal. Mercaptal.

thioacetaldehyde. $(CH_3.CHS)_3$ = 180.31. A solid, m.45, b.205, soluble in alcohol, insoluble in water or ether.

thioacetamide. C_2H_5NS = 75.1. Thiacetamide. $Me.C:S.NH_2$. Colorless leaflets; soluble in water or alcohol, m.109. Its derivatives are thiamides.

thioacetanilide. C_8H_9NS = 151.2. The thiamide, $Me.CS.NHPh$. Colorless needles, m.75, decomp. by further heat, insoluble in water, soluble in alcohol or alkalis; used in organic synthesis.

thioacetic acid. C_2H_4OS = 76.1. Thiacetic acid, thiolacetic acid. The thiolic acid, MeCOSH. A colorless liquid, d.1.074, b.93; soluble in water, alcohol or ether.

thioacetin. $C_8H_{10}O_3S$ = 150.15. Akcethin.

thioacid. An organic compound in which divalent sulfur has replaced some or all of the oxygen atoms of the carboxyl group; as,

R.CO.SH.....	thiolic acids* or carbothiolic acid*
R.CS.OH.....	thionic acids* or carbothionic acid*
R.CS.SH.....	dithionic acids* or carbodithioic acid*

If structure is uncertain:

RCSOH ⇋ RCOSH.....	thioic acid* or carbothioic acid*, *e.g.*,
CH_3COSH or CH_3CSOH	ethanethioic acid* or methane carbothioic acid*

If structure is certain:

CH_3COSH.....	ethanethiolic acid* or methane carbothiolic acid*
CH_3CSOH.....	ethanethionic acid* or methane carbothionic acid*
CH_3CSSH.....	ethanethionothiolic acid* or methane carbodithioic acid*

They differ from sulfo-acids, in which sulfur is tetra- and hexavalent. See *polythionic acids*, *carbylic acid*.

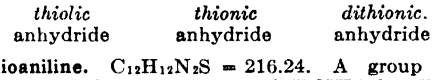
thioalcohol. Hydrosulfide.

thioaldehyde. A group of organic compounds containing the monovalent —CHS radical. They have the suffix -thial*, q.v.

thioamides. A group of organic compounds of the type $R.CS.NH_2$.

thioanhydride. An anhydride of a thioacid.

Three types:



thiolic anhydride — *thionic* anhydride — *dithionic.* anhydride

thioaniline. $C_{12}H_{12}N_2S$ = 216.24. A group of compounds of the type, $(C_6H_4NH_2)_2S$. *E.g.*, p-diamidodiphenylsulfide, m.115; o-diamidodiphenylsulfide, m.93. Soluble in ether, insoluble in water or alcohol.

thioantimonate. A salt of the unknown orthothioantimonic acid, H_3SbS_4 or $Sb_2S_5.3H_2S$. See *Schlippe's salt*.

thioantimonites. Salts of the type R_3SbS_3, $R_4Sb_2S_5$ and RSb_2, known only in solution.

thioarsenate. A salt of the type, M_3AsS_4.

thioarsenite. A salt of the type, M_3AsS_3.

thiobacteria. A group of bacteria that reduce or oxidize sulfur compounds.

thiobenzaldehyde. PhCHS = 122.14. **alpha-** A solid, m.160, decomp. by further heat. Soluble in alcohol or benzene, insoluble in water. **beta-** A solid, m.225, soluble in acetic acid.

thiobenzamide. C_7H_7NS = 137.1. The thiamide, $Ph.CS.NH_2$. Colorless crystals, m.116.

thiobenzanilide. $C_{13}H_{11}NS$ = 213.2. The thiamide, $Ph.CS.NHPh$. Colorless crystals, m.98.

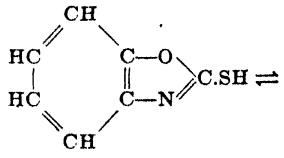
thiobenzimidazolone. Phenylene thiourea.

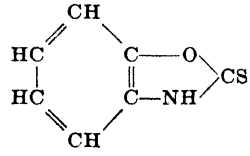
thiobenzoic acid. $C_7H_6OS.\frac{1}{2}H_2O$ = 147.15. The thiolic acid, Ph.COSH. Colorless crystals,

m.24; insoluble in water, soluble in alcohol or ether. Cf. *sulfobenzoic acid.*

thiobenzophenone. $C_{13}H_{10}S$ = 198.14. Ph.CS.Ph. Colorless crystals, m.146.5.

thiobenzoxazole. C_7H_5ONS = 151.1. The heterocyclic tautomeric compound:

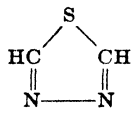




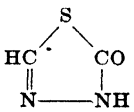
Colorless crystals, m.193.

thiobetaine. Thetine.

thiobiazoline. $C_2H_2N_2S$ = 86.1. Thio-bb'-diazole. The heterocyclic compound,



thiobiazolone. $C_2H_2ON_2S$ = 102.1. The heterocyclic compound,



thiocacodylate. A salt of thiocacodylic acid containing the Me_2AsOS— radical.

thiocarbamic acid. CH_3NS_2 = 93.16. $CS(NH_2)SH$, soluble in water, alcohol or ether. **t. ester.** An organic compound of the type, $R_2N.CS.OR$; *e.g.*, diphenylthiocarbamic phenyl ester, $Ph_2N.CS.OPh$.

thiocarbamide. Thiourea.

thiocarbanilide. Sulfocarbanilide.

thiocarbimide. Isothiocyanic acid.

thiocarbin. A mercaptan prepared by boiling glycerol with sodium thiosulfate; used as photographic emulsion ripening accelerator, and as an analytical reagent.

thiocarbonate. (1) A salt of trithiocarbonic acid of the type, M_2CS_3. (2) A salt of one of the thiocarbonic acids.

thiocarbonic acids. (1) A group of thioacids derived from carbonic acid by substitution of one or more of its oxygen atoms:

monothiocarbonic acid (thioncarbonic acid)	$CS(OH)_2$
carbonylmonothio acid (thiolcarbonic acid)	$CO(SH)OH$
dithiolcarbonic acid (carbonyl-dithio acid)	$CO(SH)_2$
dithiocarbonic acid (See *xanthic* acid)	$CS(SH)OH$
trithiocarbonic acid	$CS(SH)_2$

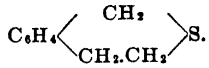
(2) H_2CS_3 = 110.6. An insoluble liquid, cf. *sulfocarbonic acid.* **ortho-** $C(SH)_4$. Known only in esters. **per-** H_2CS_4 = 142.2. A red oily liquid, decomp. to CS_2, H_2S and S. **t. ester.** An ester of a thiocarbonic acid; as, diphenyl-*thio*carbonic ester, PhO.CS.OPh. diphenyl*thiol*carbonic ester, PhO.CO.SPh.

thiocarbonyl. The divalent >CS radical, analogous to >CO.

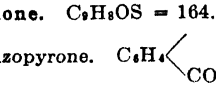
thiocarbonylchloride. Thiophosgene.

thiocarburyl chloride. Thiophosgene.

thiochroman. $C_9H_{10}S$ = 150.08. Dihydrobenzothiopyran.



thiochromanone. C_9H_8OS = 164.06. 2.3-dihydro-1.4-benzopyrone.

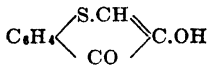


thiochrome. A fluorescent quinochrome (q.v.) which contains sulfur. It is an oxidation product of vitamin B_2 (q.v.), and is used to determine it.

thiochromene. 1.2-Benzothiopyran.

thiochromone. 1.4-Benzothiopyrone. **2.3-dihydro-** Thiochromanone. **3-hydroxy-** Thiochromonol. **2-phenyl-** Thioflavone. **2-phenyl-4-keto-** Thioflavone.

thiochromonol. $C_9H_6O_2S$ = 178.1. 3-hydroxybenzothiopyrone, hydroxythiochromone.

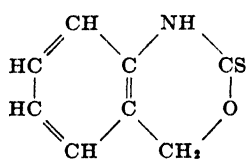


thiocol. Registered trade-mark for a preparation of potassium guaiacol sulfonate.

thiocoumarin. 1.2-Benzothiopyrone.

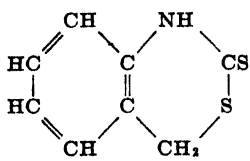
thiocresol. MeC_6H_4SH = 124.16. **ortho-** m.15, b.193. A solid. **meta-** A liquid. **para-** A solid, m.43, b.191. It stimulates cell proliferation and granulation of tissue.

thiocumazone. C_8H_7ONS = 165.14. Benzodihydrothiometoxazine. The heterocyclic compound,



Colorless crystals, m.142.

thiocumothiazone. $C_8H_7NS_2$ = 181.21. Benzodihydrothiothiazine. The heterocyclic compound,



Colorless crystals, m.166.

thiocyanate*. A salt of thiocyanic acid, which contains the monovalent radical, —SCN. Thiocyanate is the term preferred for thiocyanide, sulfocyanate, sulfocyanide, rhodanate, rhodanide.

thiocyanic acid. HSCN = 59.1. Sulfocyanic acid, rhodanic acid. HS.C:N. A colorless liquid; m.5, decomp. 200, soluble in water, alcohol or ether. **t. ester.** An ester of thiocyanic acid of the type, R—SCN. *E.g.*, methylthiocyanate, MeSCN; ethylthiocyanate, EtSCN.

thiocyanide. Thiocyanate.

thiocyano. The monovalent radical, NCS—. **t. dyestuffs.** Dyestuffs produced from nuclear-substituted t. derivatives or aromatic amines and phenols. They are deeper in shade than the corresponding non-substituted compound.

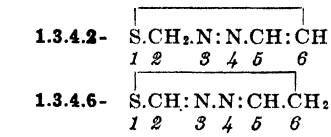
thiocyanogen. $C_2N_2S_2$ = 116.0. NCS—SCN, white rhombic crystals, m. −2; unstable, particularly in light. It behaves like a halogen. **t. value.** An analogue of the iodine number (q.v.) in which the thiocyanate radical replaces iodine. Cf. *thiocyanometry.*

thiocyanometry. Rhodanometry. Volumetric analytical methods using thiocyanates; as, determination of silver, the halogen-absorbing capacity of unsaturated compounds, etc.

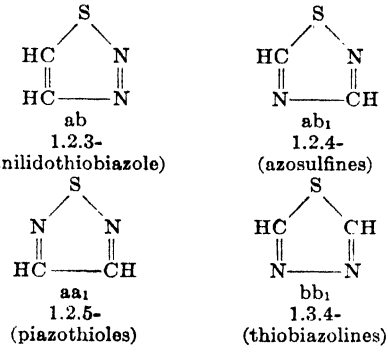
thiocyanuric acid. $C_3N_3S_3H_3$ = 177.25. Yellow needles, decomp. 200, soluble in alcohol, water or ether.

thiodialkylamine. An organic compound of the type, R_2NSNR_2; as, thiodiethylamine, $Et_2NSN.Et_2$.

thiodiazine. Diazthines. Derivatives of the heterocyclic compounds:



thiodiazoles. $C_2H_2N_2S$ = 86.2. A group of heterocyclic compounds:



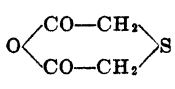
dihydro- Thiodiazoline. **tetrahydro-** Thiodiazolidine.

thiodiazolidine. $C_2H_6N_2S$ = 90.2. Tetrahydrothiodiazole. A group of heterocyclic compounds derived by saturating thiodiazoles.

thiodiazoline. $C_2H_4N_2S$ = 88.2. Dihydrothiodiazole. A group of heterocyclic compounds derived by partially saturating thiodiazoles.

thiodiglycol. Dioxyethylene sulfide. $S(CHOH.CH_2OH)_2$.

thiodiglycollic anhydride. $C_4H_4O_3S$ = 132.10. The heterocyclic compound,



Colorless crystals, m.103, b.159.

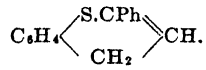
thiodiphenylamine. Phenothiazine.

thioether. Alkylsulfide, sulfur ether. An organic compound of the type, R.S.R., obtained from alkylhalides and alkalisulfides, and forming colorless volatile liquids that can be oxidized to sulfones. *E.g.*,

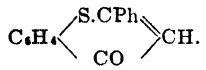
methylsulfide	Me_2S, b.37
ethylsulfide	Et_2S, b.91
n-propylsulfide	Pr_2S, b.130
n-butylsulfide	Bu_2S, m.182
vinylsulfide	$(CH_2:CH)_2S$, b.101
allylsulfide	$(CH_2:CH.CH_2)_2S$, b.140

In mixed ethers the term thio* is used; thus, methylthioethane*, MeSEt.

thioflavol. $C_{15}H_{12}S$ = 224.09. Phenylbenzothiopyran. The heterocyclic compound,



thioflavone. $C_{15}H_{10}OS$ = 238.09, 4-keto-2-phenyl-1.4-benzothiopyrone.



thioform. A basic bismuth dithiosalicylate, used as a dental antiseptic.

thioformanilide. C_7H_7NS = 137.14. The thioaldehyde, Ph.NH.CSH. Colorless crystals, m.137.

thiofuran. Thiophen.

thiogenic dyes. Sulfur dyes.

thioglycerol. $C_3H_8O_2S$ = 108.12. **1-** $CH_2SH.CHOH.CH_2OH$. A colorless liquid, d.1.295, decomp. by heat. **2-** $(CH_2OH)_2CHSH$. ***1.2-di-*** $C_3H_8OS_2$ = 124.19. A thick liquid, d.1.342, decomp. 130. **tri-** $C_3H_8S_3$ = 140.26. A heavy odorous liquid, d.1.391. They are all used to treat skin diseases.

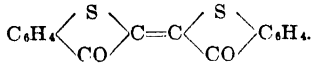
thioglycollic acid. $C_2H_4O_2S$ = 92.04. $CH_2SH.COOH$. White crystals, used as reagent for iron (1:10 million).

thiohydantoic. See *hydantoic.*

thiohydroquinone. $C_6H_4(SH)_2$ = 142.20. A solid, m.98.

thiohydroxy. Hydrosulfide, q.v. Cf. *thiol**.

thioindigo. $C_{16}H_8O_2S_2$ = 296.20.



Used as a permanent purple dye.

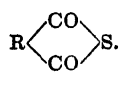
thioindigotic acid. Sulfindigotic acid.

thioketone. A compound of the type R_2CS. Their suffix is -thione*; as, *2*-butanethione*, MeCSEt or $CH_3.CS.CH_2.CH_3$.

thiol*. The monovalent radical, —SH. Cf. *hydrosulfide, thiols.*

thiolacetic acid. (1) Thioacetic acid. (2) Thioglycollic acid (incorrect use).

thiolic acid. An organic compound containing the monovalent radical, —CO.SH. **t. anhydride.** A compound of the type



thiols. Mercaptans, hydrosulfides. A compound of the type R.SH: methanethiol*, CH_3SH; ethanedithiol*, $CH_2SH.CH_2SH$, propanetrithiol*, $(CH_2SH)_2CHSH$.

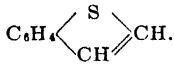
thion. Pertaining to divalent sulfur. Cf. *thione.* **t. dyes.** Sulfur dyes. **t. kudor.** A red-yellow solution of sulfur in boiling milk of

lime. It contains the calcium polysulfides, CaS_2 to CaS_7.

thionalid. Thio-glycollic-β-amino-naphthalide; used as a reagent.

thionamic acids. An organic compound of the type, R.NH.S:O.OH, in which sulfur replaces the carbon of the COOH group. *E.g.* ethylthionamic acid, EtNH.SOOH; diethylthionamic acid, $Et_2N.SOOH$. Cf. *carbamic acid.*

thionaphthene. C_8H_6S = 134.1. Benzothiophene, benzothiofuran. The heterocyclic compound,



Colorless leaflets, m.31, b.221; soluble in alcohol.

thionate. Thiosulfate. **di-** A salt of the type $M_2S_2O_6$. **penta-** A salt of the type $M_2S_2O_6$. **tetra-** $M_2S_4O_6$. **tri-** $M_2S_3O_6$.

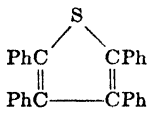
thion dyes. Sulfur dyes.

-thione*. The suffix for a thioketone; as, propanethione*, $CH_3.CS.CH_3$. Cf. *thion.*

thioneine. $C_9H_{16}N_3O_2S$ = 230.12. Thionene, thiazine, ergothioneine, sympectothiene,

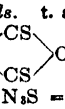
A constituent of blood and certain plants. Cf. *histidine.*

thionessal. $C_{28}H_{20}S$ = 388.2. The heterocyclic compound,

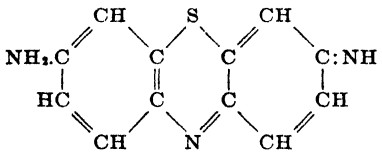


Colorless crystals, m.184.

thionic acid. (1) An organic compound containing the monovalent —CS.OH radical. (See *thioacids, polythionic acids.*) (2) A compound of the type, $H_2S_nO_6$, where n varies from 2 to 5. See *sulfuric acids.* **t. anhydride.** A compound of the type



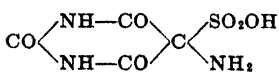
thionine. $C_{12}H_9N_3S$ = 227.2. Lauth's violet, amidophenthiazine. The heterocyclic compound,



A greenish-black powder of metallic luster, soluble in water with violet color. Used as a nuclear stain in microscopy, and as a hydrogen-ion indicator. Cf. *thioneine, leucothionine, methylene blue.*

thiono. The divalent radical, =CS. Cf. *thiocarbonyl, thione*.*

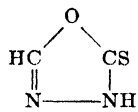
thionuric acid. $C_4H_3O_6N_3S$ = 223.14. Sulfamidobarbituric acid. The heterocyclic compound,



thionyl. Sulfinyl. The divalent group, =SO, from sulfurous acid. Cf. *sulfoxide, thienyl.* **t. amines.** An organic compound of the type, R.N:SO. *E.g.*, thionylmethylamine, Me-N:SO, b.58; thionylethylamine, EtN:SO, b.75. **t. aniline.** C_6H_5ONS = 139.1. PhN:SO. A colorless liquid, d.1.236, b.200; used in organic synthesis. **t. benzene.** $C_{12}H_{10}OS$ = 202.1. Diphenylsulfoxide, Ph_2SO. Colorless crystals, m.70. **t. bromide.** $SOBr_2$ = 207.91. A red liquid, b.$_{40mm}$.68. **t. chlorobromide.** SOClBr = 163.45. A yellow liquid, b.115. **t. chloride.** $SOCl_2$ = 118.9. A colorless, pungent liquid, b.79; used in organic synthesis. **t. dialkylamine.** An organic compound of the type, $R_2N.SO.NR_2$; as thionyldiethylamine, $(Et_2N)_2SO$, b.118. They may be considered as carbamides (ureas) in which the carbon atom is replaced by a tetravalent sulfur atom; or as substituted amides of sulfurous acid. Cf. alkyl *sulfamide.* **t. fluoride.** SOF_2 = 86.07. A colorless gas, b.—32. It forms with ammonia the compounds, $2SOF_2.5NH_3$ and $2SOF_2.7NH_3$. **t. hydrazine.** An organic compound of the type, $R_2N.N:SO$. *E.g.*, thionyldiethylhydrazine, $Et_2N.NSO$. **t. imide.** SONH = 63.2. A colorless liquid, m.—85, prepared by the action of ammonia on t. chloride. It polymerises at —70°C. to a yellow transparent resin, soluble in alcohol or acetone, insoluble in most other organic solvents or water. **t. toluidines.** C_7H_7ONS = 153.1. $Me.C_6H_4N:S:O$. ortho-, b.184; meta-, b.220; para-, m.7, b.224. Used in organic synthesis.

thio-oxamide. $(CSNH_2)_2$ = 120.18. A solid, soluble in alcohol or ether, decomp. by heat.

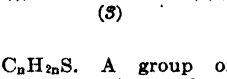
thio-oxybiazoline. The heterocyclic compound,



It is known only in the form of its derivatives; as, n-naphthyl-amido-, $NH_2—C_2ON_2S—C_{10}H_7$.

thio-oxydiphenylamine. Sulfaminol.

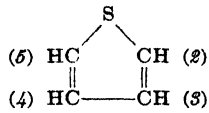
thiophane. $C_5H_{10}S$ = 92.15. The heterocyclic compound



Cf. *pyrane.*

thiophanes. $C_nH_{2n}S$. A group of sulfurated hydrocarbons from crude petroleum.

thiophen(e). C_4H_4S = 84.11. Thiofuran. The heterocyclic compound,



A colorless, benzene-like liquid, $d._{15}$°1.071, m.—37, b.84; insoluble in water, soluble in alcohol or ether. It forms numerous derivatives; used in organic synthesis. Cf. *thienyl.* **amino-** Thiophenine. **benzo-** Thionaphthene. **methyl-** Thiotolene. **nitro-** q.v. **tetrahydro-** Butylene sulfide. **tetraphenyl-** Thionessal.

t. alcohol. $C_4H_3S.CH_2OH$ = 114.13. A liquid, b.207. **t. carboxylic acids.** A group of acids derived from thiophen:

$C_4H_3S.COOH$ = 128.12.

2-thiophen carboxylic acid.	m.126, b.260
3-thiophen carboxylic acid.	m.136

$C_4H_2S(COOH)_2$ = 172.2.

2.3-thiophen dicarboxylic acid	m.260
2.4-thiophen dicarboxylic acid	m.118
2.5-thiophen dicarboxylic acid	b.30

t. biniodide. $C_4H_2I_2S$ = 336.0. Thiophen diiodide. Yellow leaflets, m.40; insoluble in water, soluble in alcohol, ether or chloroform. Used as an iodoform substitute and antiseptic. **t. sulfonate.** $C_4H_3S.HSO_3$ = 164.1. Colorless crystals; insoluble in water. The sodium salt is used as an antiseptic. **t. tetrabromide.** C_4Br_4S = 400.0. A yellow crystalline powder, m.112, b.326, insoluble in water, soluble in alcohol. It is used as an antiseptic.

thiophenine. C_4H_5NS = 99.1. Aminothiophen, $C_4H_3S.NH_2$. A yellow, liquid; insoluble in water.

thiophenol. C_6H_6S = 110.1. Phenthiol, phenylmercaptan, phenylthiol*, phenylsulfhydrate, PhSH. A colorless liquid, d.1.078, b.168, insoluble in water, soluble in alcohol or ether; used in organic synthesis. **ethenylamino-** q.v.

thiophenyl. The monovalent radical, PhS—, derived from thiophenol. Cf. *phenoxy*. **t. acetone.** A colorless liquid, m.3, b.266; soluble in alcohol.

thiophosgene. $CSCl_2$ = 115.0. Thiocarbonyl chloride, carbonthionyl chloride. A red liquid, d.1.508, b.73; insoluble in water, soluble in alcohol or ether.

thiophosphates. A group of compounds derived from phosphoric acids by substituting divalent sulfur for one or more oxygen atoms; as,

*mono*thiophosphates	M_3PO_3S
*di*thiophosphates	$M_3PO_2S_2$
*tri*thiophosphates	M_3POS_3
*tetra*thiophosphates	M_3PS_4

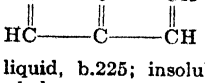
thiophosphoric acid. $PS(OH)_3$ = 114.12. A solid, decomp. by water, soluble in alcohol. **t. anhydride.** Phosphorus pentasulfide.

thiophosphorous anhydride. Phosphorus trisulfide.

thiophosphoryl. The trivalent radical, PS≡ derived from thiophosphoric acid. **t. bromide.** $PSBr_3$ = 302.86. A yellow solid, d.2.85, m.38, decomp. by further heat and by water. **t. chloride.** $PSCl_3$ = 169.5. A colorless liquid, $d_0°$.1.68, b.126, decomposed by water. **t. triamide.** $PS(NH_2)_3$ = 111.18. A white solid, decomp. by heat or water, d.1.7.

thiophthalide. C_8H_6OS = 150.1. The heterocyclic compound,  Colorless crystals, m.60.

thiophthene. $C_6H_4S_2$ = 140.10. Bithiophene. The heterocyclic compound,



A colorless liquid, b.225; insoluble in water, soluble in alcohol.

thiopyrophosphoryl bromide. $P_2S_3Br_4$ = 477.94. A yellow liquid, decomp. by water or heat.

thioresorcinol. $C_6H_4(SH)_2$ = 142.19. A yellowish-gray powder, m.27, b.243, insoluble in water; used medicinally as an antiseptic.

thiosemicarbazide. CH_5N_3S = 91.1. $H_2N.CS.NH.NH_2$. Colorless needles, m.181, soluble in water, used in organic synthesis, and as reagent for aldehydes and ketones.

thiosinamine. Allylsulfocarbamide. **t. ethyliodide.** $C_4H_8N_2S.C_2H_5I$ = 272.1. Tiodine. Colorless crystals, soluble in water or alcohol; used in medicine.

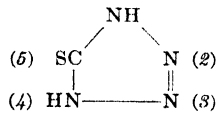
thiostannates. A salt of thiostannic acid, M_2SnS_3.

thiostannic acid. H_2SnS_3 = 216.9. Yellow unstable crystals.

thiosulfate. A salt of thiosulfuric acid of the type, $M_2S_2O_3$. Cf. *sodium t., thionate*.

thiosulfuric acid. $H_2S_2O_3$ = 114.0. An unstable acid, decomp. readily to sulfur and sulfurous acid.

thiotetrazoline. The heterocyclic compound;

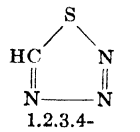


known in its compounds, *e.g.*, 1-phenylthiotetrazoline, $Ph(CHN_4S)$, m.142.

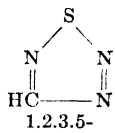
thiotolene. C_6H_6S = 98.13. Methylthiophen. A homolog of thiophen, C_4H_3MeS.

2- or alpha-	m.13, b.113
3- or beta-	b.120

thiotriazole. CHN_3S = 87.1. The heterocyclic compounds:



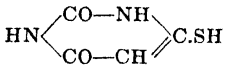
1.2.3.4-triazsulfole



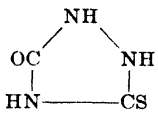
1.2.3.5-

thiouracil.  A compound used in hyperthyroidism.

thiouramil. $C_4H_4O_2N_2S$ = 144.1. The heterocyclic compound,



thiourazole. $C_2H_3ON_3S$ = 75.0. The heterocyclic compound,



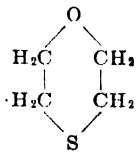
Colorless crystals, m.177; soluble in alcohol.

thiourea. CH_4N_2S = 76.1. Sulfourea, sulfocarbamide, thiocarbamide, $NH_2.CS.NH_2$ or $NH_2.CNH.SH$. Colorless prisms, d.1.42, m.180, slightly soluble in water, alcohol or ether. Used in organic synthesis, and as reagent for bismuth. **allyl-** See *allylsulfocarbamide*. **benzoyl-** q.v. **benzyl-** q.v. **diethyl-** q.v. **dimethyl-** q.v. **diphenyl-** Sulfocarbanilide. **ethyl-** q.v. **glycol-** q.v. **phenyl-** q.v. **pseudo-** $NH_2.CNH.SH$. Cf. pseudo-*urea*.

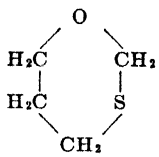
thiourethane. C_3H_7ONS = 105.14. The solid, $NH_2.CO.SEt$, m.108 (sublimes), insoluble in water, soluble in alcohol or ether.

thioxalic acid. $C_2H_2O_2S_2$ = 122.08. $(CO.SH)_2$. Cf. *rubeane*.

thioxane. C_4H_8OS = 104.1. The heterocyclic compounds,

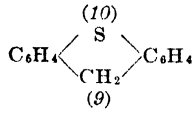


1.4- or *p*-



1.3- or *m*-

thioxanthene. $C_{13}H_{10}S$ = 198.1. Methylenediphenylenesulfide,

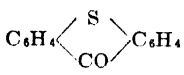


(*10*)

(*9*)

Colorless crystals, m.128, b.340; used in organic synthesis.

thioxanthone. $C_{13}H_8OS$ = 212.1. Benzophenone sulfide.



Colorless crystals, m.207, b.340.

thioxene. C_6H_8S = 112.13. Dimethylthiophen, $C_4H_2Me_2S$. A homolog of thiophen; four isomers:

2.3-	b.136	2.5-	b.135
2.4-	b.138	3.4-	b.145

thiozon. An allotrope of sulfur, q.v.

third law of thermodynamics. See *thermodynamics, entropy.*

third order. See *reactions, tertiary.*

thiuram. (1) The radical $R_2N.CS.$—. (2) $C_6H_{12}N_2S_4$ = 240.35. Bis(dimethylthiocarbamyl)-disulfide, $(Me_2N.CS.S)_2$. Yellow crystals, d.1.29, m.155. **ethyl-** $C_{10}H_{20}N_2S_4$ = 296.41. Bis(diethylthiocarbamyl)-disulfide, tetraethylthiuramdisulfide, $(Et_2N.CS.S)_2$. Yellow crystals, m.70. **t. disulfide.** A compound of the type $R_2N.CS.S.CS.NR_2$. **t. monosulfide.** A compound of the type $R_2N.CS.S.CS.NR_2$. Cf. *xanthogenate.*

thiurea. Thiourea.

thiuret. $C_6H_7N_3S_2$ = 185.2. A colorless crystalline powder, insoluble in water, soluble in alcohol or ether; used medicinally as an iodoform substitute.

thixotrope. A colloid whose properties are changed by mechanical treatment; as, clay.

thixotropic. Pertaining to thixotropy. **t. viscosity.** The anomalous viscosity of sols which are about to gel.

thixotropy. The property of certain gels of becoming fluid on shaking, and coagulating again when left at rest; as, a suspension of ferrous hydroxide. It is explained by the mechanical destruction of the zones (q.v.) of oriented molecules.

Thomas, Sidney Gilchrist. 1850–1885. An English technologist noted for his improvement of the Bessemer process. **T. meal. Basic slag. T. process.** The use of burned dolomite as a converter lining, which reacts with the phosphorus of the pig iron. **T. slag.** The finely-powdered basic slag obtained in the Thomas process. It consists of phosphates, and is used as a fertilizer.

Thompson, Benjamin. See *Rumford.*

Thompson process. Welding by means of an electric arc with the metal as an electrode.

Thomsen, Hans Peter Jürgen Julius. 1826–1909. A Danish chemist, noted for his work in thermochemistry. **T. process.** The manufacture of soda and alumina by heating powdered cryolite with lime, leaching out the sodium aluminate, and decomposing the latter into aluminum hydroxide and sodium carbonate by means of carbon dioxide.

thomsenolite. $NaCaAlF_6.H_2O$. A native fluoride of aluminum, calcium, and sodium.

Thomson, Sir Joseph John. 1856–1940. An English physicist noted for work in theoretical physics, discoverer of the electron, and Nobelist in 1906. **T., Thomas.** 1773–1852. An English chemist noted for his textbooks. **T., William.** Lord Kelvin.

thomsonite. A variety of zeolite sometimes used as a gem. It is a hydrous aluminum sodium calcium silicate.

thoria. Thorium oxide.

thorianite. A complex mineral which contains 70 % thorium oxide, 10–12 % uranium oxide, and rare earths.

thorite. $ThSiO_4$. A native thorium silicate, containing Ca, Fe, Mn, and V; varieties are freyalite and orangite.

thorium. Th = 232.12. A metal and element, atomic number 90. It occurs in monazite and thorite, and was discovered in 1828 by Berzelius. A gray, amorphous or crystalline, soft mass, readily burning in air to thorium oxide, d.11.2, m.1700; insoluble in water, alcohol, alkalis or acids, soluble in aqua regia. Thorium is radioactive and disintegrates into a series of elements. Cf. *radioactive elements, isotopes.* **meso-** See *mesothorium.* **radio-** See *radiothorium.*

t. Ω. Hibernium. **t. anhydride.** T. oxide. **t. chloride.** $ThCl_4$ = 374.2. Colorless, deliquescent plates, d.4.59, m.820 (sublime), soluble in water, alcohol or ether; used in the manufacture of incandescent burners. **t. dioxide.** T. oxide. **t. emanation.** Thoron, Tn. A radioactive gas; a disintegration-product of thorium. **t. hydroxide.** $Th(OH)_4$ = 300.4. A colorless, gelatinous substance, insoluble in water or alcohol. Formed on adding a hydroxide solution to thorium salt solutions. **t. lead.** ThD. See *radioactive elements.* **t. nitrate.** $Th(NO_3)_4.3H_2O$ = 534.2. A white, hygroscopic, crystalline or granular powder, soluble in water, decomp. to thorium oxide by heat. Used extensively in the manufacture of Welsbach mantles. **t. oxalate.** $Th(C_2O_4)_2$ = 408.12. White crystals, d.4.637, insoluble in water, soluble in ammonium oxalate solution. *hexahydrate-* $Th(C_2O_4)_2.6H_2O$ = 516.21. White amorphous powder. **t. oxide.** ThO_2 = 264.1. Thoria, t. dioxide. A white amorphous, infusible powder, d.9.9, insoluble in water or acids; it constitutes a large proportion of the white ash of incandescent gas mantles. Used medicinally as substitute for bismuth subnitrate in taking x-ray pictures. **t. picrate.** $Th(C_6H_2N_3O_7)_4.10H_2O$ = 1324.43. A yellow powder, highly explosive. **t. series.** See *radioactive elements.* **t. sulfate.** $Th(SO_4)_2.4H_2O$ = 496.2. Colorless crystals; slightly soluble in water. **t. x.** ThX. A radioactive substance produced from thorium, through the three intermediate products, Mesothorium I and II, and radiothorium. (See *radioactive series.*)

thornapple. Stramonium.

thorogummite. $UO_2.3ThO_2.3SiO_2.6H_2O$. A native hydrous silicate of thorium and uranium.

thoron. Tn = 220. Thorium emanation, ThEm. An isotope of radon (niton), and member of the thorium series. (See *radioactive elements.*)

thorotrast. A colloidal preparation of thorium oxide.

thoroughwort. Eupatorium.

Thorpe, Jocelyn Field. 1872–1940. An English chemist noted for organic synthesis; author and co-editor of *Thorpe's Dictionary of Applied Chemistry.* **T., Thomas Edward** 1845–1925. An English chemist noted for atomic weight determinations, and studies on gold.

thortveitite. A mineral, consisting chiefly of scandium silicate.

Thoulet's solution. A concentrated solution of potassium and mercuric iodides in water, d.3.17; used to determine the density of minerals by the suspension method.

thread. (1) A string, q.v. (2) A unit of worsted yarn measure, 36 inches.

three-dimensional. Pertaining to the three dimensions: length, width and height. **t. diagram.** A graph showing the relationships along the x, y and z axes of coordinates, q.v.

threonic acid. $C_4H_8O_5$ = 136.1. The hydroxy-acid, $CH_2OH(CHOH)_2COOH$ from threose.

threonine. α-Amino-β-hydroxy butyric acid.

threose. $C_4H_8O_4$ = 120.1. A tetrose and isomer of erythrose. It occurs in d- and l-forms.

threosic acid. $C_4H_6O_5$ = 134.1. The aldehyde-hydroxy acid, $CHO(CHOH)_2COOH$ from threose.

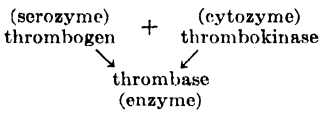
threshold. (From the German: schwellen wert). Liminal value.

thrombase. Thrombin, zymoplasm. The coagulating enzyme of the blood that transforms fibrinogen to fibrin, thus causing the coagulation of the blood.

thrombin. Thrombase.

thrombocytes. Blood platelets.

thrombogen. Serozyme. A substance of the blood that gives the enzyme, thrombase, with thrombokinase.



thrombokinase. Thrombozym. A substance in the blood cells that causes the formation of thrombase, and thence the clotting of blood. Cf. *coagulen, fibrinogen.*

thromboplastin. An extract of cattle brain. Used, in physiological salt solutions, as a hemostatic, and also in surgery.

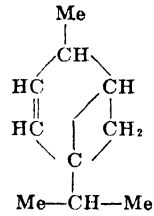
thrombosis. The formation of clots or plugs in the blood vessels.

thrombozym. Thrombokinase.

throwing power. The efficiency of an apparatus or electrolyte for the electro-deposition of metals. It is measured by: $(L - M)100/(L + M - 2)$; where L is the ratio of the distance between the anode and two half-cathodes in the liquid, and M is the ratio of the weights of metal deposited on the two half-cathodes.

thuja. Thuya. Arbor vitae, white cedar, tree of life. The dried, leafy young tops of *Thuja occidentalis,* a Pinaceae of North America and Europe. It contains an essential oil and tannin, which is used medicinally as a diuretic an sudorific. **t. oil.** Oil of white cedar. An essential oil from thuja. It has a sharp, camphor-like odor and taste, d.0.925, b.190; insoluble in water, soluble in alcohol. It contains pinene, fenchene, thujone and carvone.

thujene. $C_{10}H_{16}$ = 136.2. Tanacetene. A terpene obtained from thuja oil,



hydroxy- Thujol.

thujetic acid. $C_{28}H_{22}O_{13}$ = 566.2. A compoun obtained by heating thujin with barium hydroxide.

thujetin. $C_{14}H_{14}O_8$ = 310.1. A colorless, crystalline substance formed by hydration of thujigenin. It resembles quercitrin.

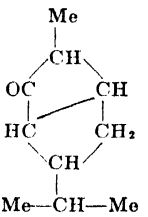
thujigenin. $C_{14}H_{12}O_7$ = 292.1. A decomposition product of thujin. Cf. *thujetin.*

thujin. $C_{20}H_{22}O_{12}$ = 454.18. A glucoside and coloring matter of thuja. Yellow crystals, insoluble in water, soluble in alcohol. It hydrolyzes to thujigenin.

thujoid. The combined principles of thuja; used medicinally.

thujol. $C_{10}H_{16}O$ = 152.2. Absinthol. Hydroxythujene. An alcohol in thuja oil.

thujone. $C_{10}H_{16}O$ = 152.2. Thalviol, 6-keto-sabinane, salviol, tanacetone. The dextrorotatory ketone,



A colorless liquid, d.0.913, b.203, from the essential oil of *Thuja* and *Salvia* species; insoluble in water, soluble in alcohol.

thujorhodin. Rhodoxanthin.

thujyl. The monovalent radical, $C_{10}H_{17}$—, derived from sabinane.

thulite. Zoisite.

thulium. Tm (or Tu) = 169.4. A rare earth metal and element, atomic number 69. It has a valency of three, and was discovered by Cleve in 1879 and independently by Soret. Its salts are greenish white. **t. chloride.** $TmCl_3$ = 275.8. Colorless crystals; soluble in water. **t. oxalate.** $Tm_2(C_2O_4)_3.6H_2O$ = 710.89. Greenish white precipitate, soluble in alkaline oxalate solutions. **t. oxide.** Tm_2O_3 = 386.8. A white amorphous powder; insoluble in water.

thuringite. $4(AlFe)_2O_3,7FeO,6SiO_2,9H_2O$. An amorphous mineral.

thus. Olibanum.

thuya. Thuja.

thymacetin. $C_6H_2MeC_3H_7(OEt)NHC_2H_3O$. Thymol-phenacetin. A white crystalline pow-

der, slightly soluble in water, soluble in alcohol; used medicinally as a hypnotic and analgesic.

thymamine. $C_{22}H_{40}O_5N_6$ = 468.2. A protamine isolated from the thymus gland.

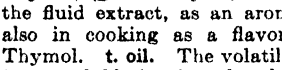
thyme. Thymus. The dried tops of *Thymus vulgaris*, (garden thyme) a Labiatae. Used, as the fluid extract, as an aromatic carminative; also in cooking as a flavoring. **t. camphor.** Thymol. **t. oil.** The volatile oil of t., d.0.894–0.930, soluble in alcohol and occurring in many grades.

thymegol. See *egol*.

thymene. $C_{10}H_{16}$ = 136.2. A terpene from thyme oil. A colorless aromatic liquid, d.0.868, b.160, insoluble in water, soluble in alcohol; used as an antiseptic. Cf. *thymine*.

thymidol. Methylpropylphenylmenthol. A condensation-product of thymol and menthol, used as an antiseptic mouth wash.

thymine. $C_5H_6O_2N_2$ = 126.06. 5-Methyluracil;



Colorless crystals, decomp. 335; a constituent of nucleic acids. Cf. *thymene*.

thyminic acid. Solurol.

thymiodol. Thymol iodide.

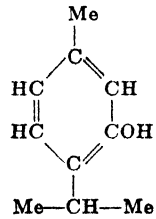
thymipin. A dialyzate of *Thymus vulgaris*, *Drosera rotundifolia* and *Pinguicula alpine*. Used in the subcutaneous treatment of whooping cough.

thymodin. Thymol iodide.

thymoform. $C_{21}H_{28}O_2$ = 312.3. A condensation-product of thymol and formaldehyde, $CH_2:(C_6H_2Me_2CH_7O)_2$. A yellow powder; insoluble in water, soluble in alcohol or ether. Used as an antiseptic dusting powder.

thymohydroquinone. $C_{10}H_{14}O_2$ = 166.16. A solid, m.140, b.290, slightly soluble in water, soluble in alcohol or ether.

thymol. $C_{10}H_{14}O$ = 150.2. Thyme camphor, p-propyl-m-cresol, 3-methyl-6-iso-propylphenol, 3-hydroxy-*p*-cymene, 1-methyl-3-hydroxy-4-isopropyl-benzene.



Colorless crystals, d.0.979, m.50, b.230, slightly soluble in water, soluble in alcohol or ether. Used as a reagent for indican, and medicinally, as an antiseptic. **acetyl-** q.v. **diiodo-** T. iodide. **hexahydro-** Menthol.

t. blue. $C_{27}H_{30}O_5S$ = 466.23. T. sulfonphthalein. A black powder, used as pH indicator, changing from pink (1.5) to yellow (2.8–8) to blue (9.6). *brom-* See *indicators*. **t. cambamate.** $C_{11}H_{15}O_2N$ = 193.2. Thymol urethane, thymotal, tyratol, thymolcarbamic ether, $C_{10}H_{13}OCO.NH_2$. A colorless crystalline powder, slightly soluble in water, decomp. by hydroxides; used medicinally as an intestinal antiseptic. **t. iodide.** $(C_{10}H_{13}OI)_2$ = 552. Diiodothymol, aristol, annidalin, thymotol, iodohydromol, iodosol, thymiodol, thymodin. A reddish-brown powder, obtained by the treatment of thymol with iodine in alkaline solution, insoluble in water, soluble in alcohol; used medicinally as an iodoform substitute and antiseptic. **t. phenacetin.** Thymacetin. **t. phthalein.** A pH indicator changing at 9.8 from colorless (acid) to blue (basic). **t. salicylate.** Salithymol. **t. sulphonphthalein.** T. blue. **t. urethane.** T. carbamate.

thymoquinone. $C_{10}H_{12}O_2$ = 164.15. Colorless crystals, m.46, b.232; soluble in water, alcohol or ether.

thymotal. Thymol carbamate.

thymotic acid. $C_{11}H_{14}O_3$ = 194.27. $C_6H_2(Me)$-$C_3H_7(OH)COOH$. Colorless crystals, m.127° (sublime), soluble in alcohol or ether. **t. alcohol.** Methyl-*i*-propyl-benzyl alcohol. **t. anhydride.** $C_{11}H_{12}O_2$ = 176.15. Colorless crystals, m.174.

thymotol. Thymol iodide.

thymovidin. A hormone from thymus.

thymus. (1) Thyme. (2) A lymph-gland in the neck and chest of an infant or young animal, which disappears before maturity is reached. Cf. *thymamine*. **t. histon.** A protein from t., mol. wt. = 6000, which lowers the pressure and coagulability of blood.

thymyl. The monovalent radical,

derived from thymol.

thynnin. A protamine (75 % arginine) from the sperm of *Thymnus thynnus*, the tunny fish of the Pacific Ocean.

thyraden. A dried extract of the thyroid gland; used medicinally for rickets and cretinism.

thyratron. A gas-filled, hot-cathode, grid-controlled valve rectifier and self-amplifier.

thyresol. $C_{18}H_{23}OMe$ = 234.21. Santalol methyl ester. A colorless liquid, used medicinally as a santalol substitute in urethritis.

thyroglobulin. A pseudoglobulin containing thyroxine and diiodotyrosine; it is considered to be the thyroid hormone.

thyroid. Thyroideum siccum. The dried thyroid glands of animals. A yellowish powder, slightly soluble in water; used medicinally as an alterative. **t. gland.** A large gland in front and on either side of the windpipe of man and animals; it produces thyroxine.

thyroidectin. The dried blood of animals from which the thyroid gland has been removed; used medicinally in goiter.

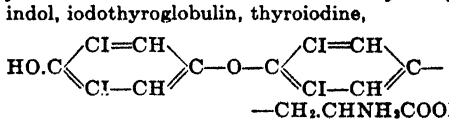
thyroidine. A crystalline iodine-free substance obtained from thyroid.

thyroiodine. Thyroxine.

thyro-oxindole. Thyroxine.

thyrotrophin. The active principle of the anterior lobe of the pituitary gland; it acts on the thyroid gland.

thyroxine. $C_{15}H_{11}O_4NI_4$ = 776.8. Thyro-oxyindol, iodothyroglobulin, thyroiodine,



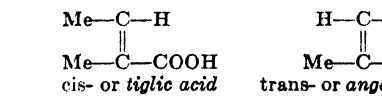
It is a derivative of tyrosine, and is the natural or synthetic active hormone of the thyroid gland. Colorless crystalline needles, m.250; insoluble in water. Used medicinally for goiter, cretinism and myxedema.

Ti. The symbol for titanium.

tiemannite. HgSe. Native mercurous selenide.

tiglaldehyde. C_5H_8O = 84.06. Guaiol, tiglic aldehyde, *2*-methyl-*2*-butenal*, MeCH:CMe.CHO. A colorless liquid, d.0.870, b.116.5.

tiglic. Pertaining to tiglium. **t. acid.** $C_5H_8O_2$ = 100.1. Methylcrotonic acid, iso-angelic acid, cevadic acid, *2*-methyl-*2*-butenoic acid*. An unsaturated, monobasic acid, which occurs in two isomeric forms in croton oil and chamomile oil.



cis- or *tiglic acid* trans- or *angelic acid*, q.v.

Colorless prisms, d.0.964, m.64, b.198; slightly soluble in water, soluble in alcohol or ether. Its isomer is angelic acid (q.v.). **t. aldehyde.** Tiglaldehyde.

tiglium. Croton seeds. The dried seeds of the croton oil plant, *Croton tiglium*, an Euphorbiaceae of the East Indies and Philippines. It contains croton oil, tiglic acid and crotonol; used as a drastic purgative.

tikitiki. Darak.

tile ore. Cuprite.

tilia. Linden flowers, lime flowers. The dried flowers of *Tilia europea*, a Tiliaceae of Europe. It contains an essential oil; used as an antispasmodic and tonic.

Tillmans' reagent. *2,6*-Dichlorophenol indophenol, which is a quantitative reducing agent for ascorbic acid.

timbo. The bark of *Serjania curassavica*, a Sapindaceae of Brazil; it contains an alkaloid and is used by natives as a fish-poison.

timbonine. An alkaloid from timbo.

time. (1) The fourth dimension; a measure of duration of an object, phenomenon or event. The standard unit is the second, *i.e.*, 1/86,400 part of a mean solar day; 1 second equals 1000 σ. Sensitive measurements of time are made with a tuning fork (registers $\frac{1}{1000}$ to $\frac{1}{10000}$ second). Longer periods are measured in days (q.v.) and years, q.v. The velocity of light per meter is 10^{-8} second. (See table.) (2) The relative hour of a day, which depends on geographical longitude and the position of the earth relative to the sun. Cf. *year*.

MAGNITUDES IN TIME

Sun diminishing one half its mass		1.5×10^{19}	sec.
Thorium, average life	25,000,000,000 yrs.	7.7×10^{17}	sec.
Uranium, average life	6,300,000,000 yrs.	1.9×10^{17}	sec.
Earth age (He in rocks)	2,000,000,000 yrs.	6×10^{16}	sec.
Universe, doubling in size	1,400,000,000 yrs.	4.3×10^{16}	sec.
Earth, Proterozoic era	850,000,000 yrs.	2.6×10^{16}	sec.
Earth, Paleozoic era	420,000,000 yrs.	1.3×10^{16}	sec.
Sun period in Milky Way	200,000,000 yrs.	6.2×10^{15}	sec.
Earth, Quaternary period	1,500,000 yrs.	4.6×10^{13}	sec.
Ionium, average life	120,000 yrs.	5×10^{12}	sec.
Dawn of history	6,000 yrs.	1.9×10^{11}	sec.
Birth of Christ	1,943 yrs.	6×10^{10}	sec.
Pluto period around sun	282 yrs.	8.7×10^{9}	sec.
Neptune period around sun	164.7 yrs.	5×10^{9}	sec.
Steam engine invented	162 yrs.	4.9×10^{9}	sec.
Oxygen discovered	162 yrs.	4.9×10^{9}	sec.
Urea synthesized	107 yrs.	3.1×10^{9}	sec.
Man, average life	42 yrs.	1.3×10^{9}	sec.
Radium and x-ray discovered	35 yrs.	1×10^{9}	sec.
1 year = 31,536,000 sec		3.1×10^{7}	sec.
Earth period around sun	365.2 days	3.1×10^{7}	sec.
Mercury period around sun	87.96 days	7.6×10^{6}	sec.
Uranium X[1], average life	35.4 days	3×10^{6}	sec.
Moon period around earth	27.8 days	2.3×10^{6}	sec.
Sun rotation	24.6 days	2×10^{6}	sec.
Radium E, average life	7 days	6×10^{5}	sec.
1 day = 86,400 sec		8.6×10^{4}	sec.
Earth rotation, 23h. 56m. 4 sec		8.6×10^{4}	sec.
1 hour = 3,600 sec		3.6×10^{3}	sec.
Radium A, average life, 4.5 sec		270	sec.
1 minute = 60 seconds = 60,000 sigmas		60	sec.
1 second = 1,000 sigmas (σ)		1	sec.
Motion-picture image on screen	64 σ	6.4×10^{-2}	sec.
Engine wheel period (1,500 r.p.m.)	40 σ	4×10^{-2}	sec.
Alternating current cycle	10 σ	1×10^{-2}	sec.
Sound vibration (C_3)	4 σ	4×10^{-3}	sec.
Sound vibration (C_4)	2 σ	2×10^{-3}	sec.
Photographic shutter, fastest	1 σ	1×10^{-3}	sec.
1 sigma (σ) = 1,000 millisigma (mσ)		1×10^{-3}	sec.
Chromatine image	100 mσ	1×10^{-4}	sec.
Oscillograph	1 mσ	1×10^{-6}	sec.
Radium C', average life	1 mσ	1×10^{-6}	sec.
1 millisigma (mσ = 1,000 microsigma ($\mu\sigma$)		1×10^{-6}	sec.
High frequency cycle	100 $\mu\sigma$	1×10^{-7}	sec.
Radio oscillation	80 $\mu\sigma$	8×10^{-8}	sec.
Lingering period of excited atom	1$\mu\sigma$	1×10^{-9}	sec.
Thorium C', average life	1$\mu\sigma$	1×10^{-9}	sec.
1 microsigma ($\mu\sigma$) = 0.000,000,001 second		1×10^{-9}	sec.
Yellow light oscillation		5×10^{-14}	sec.
Cosmic ray oscillation		1×10^{-22}	sec.

tin. Sn = 118.70. Stannum. A metal and element, atomic number 50. A silver-white, rhombic or tetragonal metal, d.7.29, m.232, b.2270, insoluble in water, decomp. in dilute acids or concentrated alkalis. Crystalline forms:

Snβ gray tin d.5.85 brittle	18°C ⇌	Snα tetragonal d.7.29 malleable	170°C ⇌	Snγ rhombic d.6.56 brittle

Tin has a valency of two and four, and forms two series of compounds:

valency:	2	4
cations:	Sn^{++}, stannous	Sn^{++++}, stannic
anions:	SnO_2^{--}, stannites	SnO_3^{--}, stannates

The tin-organic compounds are derived mainly from tetravalent t. It is used as a metal, in alloys for t. foils, solders, utensils, type metal, dental alloys; and in the manufacture of tin salts. The World output in 1941 was 237,000 long tons, produced chiefly in the Federated Malay States > Dutch East Indies > Bolivia > Thailand > China > Nigeria.

alpha- White t. **beta-** Gray t. **black-** A treated t. ore which contains 60–70 % SnO_2. **block-** Cassiterite. **butter of-** Stannic chloride. **cry of-** The sound heard on bending a stick of tin. **flowers of-** Stannic oxide. **gray-** Beta t., β-tin. An enantiotropic form of white t. produced as a gray powder when the white t. is cooled to −40°C; the transition point is 18°C. It is the cause of tin disease, q.v. **stream-** Tinstone, occurring in an alluvial deposit. **tetraphenyl-** See *t. tetraphenyl*. **white-** Alpha-, ordinary-, α-tin. The usual form of malleable tin.

t. acetate. Stannous acetate. **t. alkyls.** A compound of the type SnR_4. See *stannanes, t. tetraethyl, t. tetramethyl, etc.* **t. alloys.** A mixture of tin and other metals. The melting points of some binary alloys are:

with	90 % Sn 10 %	80 % Sn 20 %	70 % Sn 30 %	60 % Sn 40 %	50 % Sn 50 %
Al	540°C	560°C	570°C	590°C	605°C
Ag	300°C	375°C	420°C	450°C	495°C
Sb	255°C	310°C	350°C	395°C	430°C
Cu	440°C	530°C	580°C	630°C	680°C
Pb	216°C	200°C	185°C	190°C	220°C
Ni	800°C	1060°C	1230°C	1305°C	1290°C

Cf. tables under *Al, Co, Pb, Ni, Ag;* also *babbitt, Britannia, pewter, rhine-metal, solder.* **t. ammonium chloride.** Pink salt. **t. anhydride.** Stannic oxide. **t. ash.** Stannic oxide. **t. bath.** Molten tin into which metals are dipped, and so coated with a film of tin. **t. bichloride.** (1) Stannic chloride. (2) Sodium stannic chloride, Na_2SnCl_6. **t. bisulfide.** T. disulfide. **t. bronze.** Stannic sulfide. **t. chlorides.** (1) Stannous chloride. (2) Stannic chloride. **t. chloride solution.** A solution of 5 pts. stannous chloride in 1 pt. hydrochloric acid. A slightly yellow, refractive liquid, d.1.9, used as a reagent. **t. chromate.** See *stannic* or *stannous chromate.* **t. citrate.** Stannous citrate. **t. dichloride.** Stannous chloride. **t. diethyl*.** $Sn(C_2H_5)_2$ = 176.8. Stannous ethide. An oily liquid, d.1.654, decomp. by heat; insoluble in water, soluble in alcohol. **t. dioxide.** Stannic oxide. **t. disease.** The transformation into grey t. and the resulting brittleness and loss of metallic luster. **t. disulfide.** Stannic sulfide. **t. foil.** A thin sheet of tin or tin alloy; used for wrapping food and other articles to prevent them drying out. **t. glass.** (1) A glass that contains tin; as, certain flint glasses. (2) An obsolete name for bismuth. **t. glaze.** An opaque glaze formed on pottery by tin salts. **t. hydroxide.** Stannic hydroxide. **t. iodide.** Stannic iodide. **t. minerals.** The chief ore of tin is the oxide, cassiterite. Others are:

cassiterite	SnO_2
stannite	Cu_2FeSnS_4
teallite	$PbSnS_2$
cylindrite	$Pb_3FeSn_4Sb_2S_{14}$
nordenskioldine	$CaSnB_2O_6$

t. monosulfide. Stannous sulfide. **t. monoxide.** Stannous oxide. **t. mordant.** A tin salt used in dyeing; as, stannous chloride or stannic chloride. **t. oxalate.** Stannous oxalate. **t. oxide.** See *stannous oxide, stannic oxide.* **t. oxychloride.** Stannous chloride. **t. oxymuriate.** Commercial stannic chloride, $SnCl_4.5H_2O$. **t. peroxide.** Stannic oxide. **t. pickling.** The process of immersing iron in diluted acids prior to a tin bath. **t. plate.** A sheet iron or steel covered with a film of tin. **t. protochloride.** Stannous chloride. **t. protoxide.** Stannous oxide. **t. pyrites.** Stannine. **t. salt.** Stannous chloride. **t. spar.** Cassiterite. **t. sponge.** Argentine. **t. stone.** Cassiterite. **t. sulfate.** Stannous sulfate. **t. tetraethyl.*** $Sn(C_2H_5)_4$ = 234.9. Stannic ethide. A colorless liquid, d.1.187, b.181; insoluble in water, soluble in alcohol. **t. tetramethyl.*** $Sn(CH_3)_4$ = 178.81. Stannic methide. A colorless liquid, d.1.314, b.78; insoluble in water, soluble in alcohol. **t. tetraphenyl.*** $Sn(C_6H_5)_4$ = 426.7. Stannic phenide. Colorless crystals, m.226, b.420; soluble in ether. **t. triethyl.*** $Sn_2(C_2H_5)_6$ = 411.7. Distannic ethide, $Et_3Sn—SnEt_3$. A colorless liquid, b.270, insoluble in water or alcohol. **t. triethylhydroxide.** $Sn(C_2H_5)_3OH$ = 222.7. Stannic ethylhydroxide, Et_3SnOH. Colorless crystals, m.66, b.272.

tincal. Borax.

tincture. A medicated liquid made by extraction of a drug and generally weaker in strength than a fluid extract. **alcoholic-** A solution made by percolating 10 gms. of a drug with 100 cc. of alcohol, or macerating the same quantity of a resinous drug. **aqueous-** An extract made with water.

t. of iodine. A solution of 7 gm. iodine and 5 gm. potassium iodide in 5 cc. water, made up to 100 cc. with alcohol; used medicinally as an antiseptic.

tinder. Inflammable charred linen or wood used for lighting furnaces.

tinkal. Borax.

tinning. Coating with a film of tin; as, tin plate.

tinstone. Cassiterite.

tint. A shade of a color.

tintometer. A colorimeter or device for estimating the intensity of a colored solution by comparison with standard solutions, or colored glass slides.

tiodine. Thiosinamine ethyliodide.

tissue. In biology, a structure composed of cells and cell products.

titan yellow. Clayton yellow, thiazol yellow. A yellow dye made from dehydrothio-*p*-toluidine, used for detection of caustic alkalis (red) and magnesium (red). Cf. *titanellow.*

titanate. A salt of titanic acid; as, M_2TiO_3—metatitanate, M_4TiO_4—orthotitanate.

titanellow. Yellow titanium oxide, used for making ivory shades in dental porcelain, for dental cements and for yellow tiles. Cf. *titan yellow.*

titania. Titanium dioxide.

titanic. Pertaining to tetravalent titanium. **t. acid.** (1) H_2TiO_3 = 97.9. *meta-* $TiO(OH)_2$. A colorless precipitate obtained by boiling titanium sulfate solution, insoluble in water or acids, soluble in alkalis with the formation of salts. (2) H_4TiO_4 = 115.9. *ortho-* $TiO(OH)_4$. A white precipitate obtained by adding acids to metatitanates, soluble in excess of acid or alkali and forming with the latter, the titanyl radical. **t. anhydride.** Titanium oxide. **t. chloride.** Titanium tetrachloride. **t. hydroxide.** Titanic acid. **t. iron.** Ilmenite. **t. oxide.** Titanium dioxide.

titaniferous. Containing titanium, (mineralogical). **t. iron ore.** Ilmenite.

titanite. Sphene.

titanium. Ti = 47.90. A metallic element of the carbon group, atomic number 22, discovered by Gregor, 1789. It is a dark gray, amorphous metal, d.4.9, m.1800; insoluble in water, soluble in warm hydrochloric acid. Used (as ferrotitanium) as a cleaning and deoxidizing agent for molten steel; and in alloys with copper, bronze and other metals. Cf. *konel.* It has a valency of 2, 3, and 4 and forms several ions:

Ti^{+++}	titanous ion
Ti^{++++}	titanic ion
TiO_3^{--}	m-titanate ion
TiO_4^{----}	o-titanate ion
TiO^{++}	titanyl ion

t. bromide. $TiBr_4$ = 367.8. Orange crystals, d.2.6, m.39, b.230, decomp. by water. **t.**

chlorides. See *t. dichloride, t. trichloride, t. tetrachloride.* **t. dichloride.** $TiCl_2$ = 119.0. Titanous chloride. A black, hygroscopic powder, decomp. by water and burns when heated in air. **t. dioxide.** TiO_2 = 80.1. Titania. Colorless to black tetragonal or rhomic crystals, d.3.70–4.26, m.1560; insoluble in water, soluble in alkalis or concentrated sulfuric acid. In its pure state it is used as a white pigment for paint, water colors, inks, shoe polish, soap, rubber goods and for ceramic glazes, and as a filler for paper. **t. hydroxide.** (1) $Ti(OH)_3$ = 98.9. Titanous hydroxide. A blue black powder insoluble in water. (2) $Ti(OH)_4$ = 115.9. Titanic hydroxide. A white, insoluble solid. **t. iodide.** TiI_4 = 555.8. Titanic iodide. Red octahedral crystals, m.150, b.330; soluble in water or alcohol. **t. minerals.** Titanium is widely diffused in igneous and sedimentary rocks.

ilmenite	$FeTiO_3$
pseudobrookite	$Fe_4(TiO_4)_3$
perofskite (perowskite)	$CaTiO_3$
titanite	$CaTiSiO_5$
rutile, brookite, anatase, octahedrite	TiO_2

t. nitrate. Titanyl nitrate. **t. nitride.** Ti_2N_2 = 123.8. A dark powder prepared from rutile and nitrogen in the electric furnace; used for dusting moulds previous to casting steel. **t. oxalate.** $Ti_2(C_2H_4)_3.10H_2O$ = 539.97. Yellow prisms, soluble in water. **t. oxides.** See *t. sesquioxide, t. dioxide, t. trioxide.* **t. peroxide.** T. trioxide. **t. sesquioxide.** Ti_2O_3 = 143.8. A black amorphous powder, insoluble in water, soluble in concentrated acids. **t. sulfates:** (1) $Ti(SO_4)_2$ = 240.1. Colorless crystals; soluble in water. (2) $Ti_2(SO_4)_3$ = 384.0. Green crystals; insoluble in water, soluble in dilute acids. It is an antiseptic. **t. trichloride.** $TiCl_3$ = 154.5. Dark violet crystals, decomp. 440, soluble in water, alcohol or acids; used as a reducing agent in analytical chemistry. **t. trioxide.** TiO_3 = 95.9. Titanellow, q.v. A yellow powder. **t. tetrachloride.** $TiCl_4$ = 189.9. Titanic chloride. A colorless liquid, d.1.76, m.−26, b.136, soluble in water; used as a mordant in dyeing. **t. white.** A white pigment composed chiefly of t. dioxide.

titanous. Pertaining to trivalent titanium. **t. chloride.** Titanium trichloride.

titanox. A mixture of titanium oxide and barium sulfate (3:1) kneaded with linseed oil and turpentine, and used for paints. **t. B.** 25 % TiO_2 with 75 % $BaSO_4$. **t. C.** 30 % TiO_2 with 70 % $CaSO_4$.

titanyl. The divalent radical, TiO=. **t. nitrate.** $TiO(NO_3)_2$ = 188.1. Titanium nitrate. Colorless crystals; soluble in water. **t. sulfate.** $TiOSO_4$ = 160.1. White crystalline needles; soluble in acidic water; used as a mordant in dyeing.

titer. (1) A standard test for oils and waxes in which the sample is completely saponified, and the solidifying-point (or titer) of the resulting separated and washed fatty acids determined. (2) The number of cc. per liter by which a normal solution differs from a true standard. (3) The normality of a solution as determined by titration with a standard. (4) The number of grams of an element, radical or compound in one cc. of a standard solution.

titrant. The standardized solution used for titration.

titrate. (1) To analyze by a volumetric method. (2) The solution being titrated.

titrating. The process of titration. Cf. volumetric *analysis.*

titration. The volumetric determination of a constituent in a known volume of a solution by the slow addition of a standard reacting solution of known strength until the reaction is completed. The end-point of the reaction is indicated by a change of color (indicators) or by galvanometric measurements. **differential-.** The t. of equal portions of the test solution in such a way that one always contains the same volume of the titrating solution in excess of that in the other. At the end-point the potential difference between the solutions in a maximum. **t. error.** The ratio of the concentration of active ions at the end-point to the initial concentration.

titre. Titer.

titrimeter. A line-operated vacuum tube device for potentiometric titrations, in which the potential changes of the system are followed continuously and automatically on a microammeter, which may be calibrated to read e.m.f. directly. Cf. *potentiometer, sectrometer.*

titrol. Tea tree oil. The volatile oil of *Melaleuca alternifolia*, a Myrtaceae of Australia; an antiseptic. Cf. *melasol.*

Tl. Symbol for thallium, element No. 81.

Tm. Symbol for thulium, element No. 69.

Tn. Symbol for thoron, isotope of No. 86.

tn. Abbreviation for ton.

T.N.A. An abbreviation for trinitroaniline.

T.N.B. An abbreviation for trinitrobenzene.

T.N.T. An abbreviation for trinitrotoluene.

T.N.X. An abbreviation for trinitroxylene.

tobacco. Tabacum. The dried leaves of *Nicotiana tabacum*, a Solanaceae. It contains nicotine, nornicotine, nicotianine, nicotelline and other alkaloids; used medicinally as a relaxant, and in large quantities for smoking and as a fumigant and insecticide. **Indian- Lobelia. t. stems.** The ground waste-products of t., used as fertilizer: 1.2–3.3 % N_2, 4–9 % K_2O.

Tobias acid. *2*-Naphthylamine-*1*-sulfonic acid; used as an intermediate.

Tobin bronze. An alloy of 55 pts. copper, 43 pts. zinc and 2 parts tin.

tocopherols. See *vitamins E.*

toddy. (1) The fermented sap of the coconut and other palms. (2) A hot tea containing some spirituous liquor. **t. test.** See *test.*

Toison solution. A staining solution for the red blood corpuscles: 0.025 gm. methyl violet (6B), 1.0 gm. sodium chloride, 8.0 gm. sodium sulfate, 30 cc. glycerin in 300 cc. water.

tolamine. Chlorazene.

tolane. $C_{14}H_{10}$ = 178.2. Bibenzyl, diphenylacetylene. The unsaturated hydrocarbon, PhC:CPh. Colorless crystalline leaflets, m.60, b.275; insoluble in water, soluble in alcohol or ether. **t. sulfide.** $C_{14}H_{10}S$ = 210.1. Tollalylsulfide. PhC(=CPh)–S– Colorless crystals, m.174.

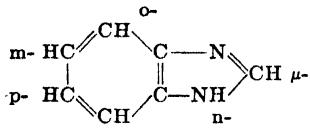
tolerance. (1) The capacity to withstand the effects of a continued use of a drug. (2) The limit of error permitted in the graduation of measuring instruments, as, standardized burets; or, in general, of any standardized product.

tolidine. $C_{14}H_{16}N_2$ = 212.22. Dimethylbenzidine, 4.4′-diamino-3.3′-dimethyldiphenyl, $NH_2MeC_6H_3.C_6H_3MeNH_2$. **3.3′.4.4′.-** Colorless

scales, m.129, slightly soluble in water, soluble in alcohol or ether. **2.2′.4.4′-** m.109. **1.1′.4.4″-** m.128; **a reagent. t. sulfate.** $C_{14}H_{16}N_2.H_2SO_4$ = 310.3. A white or reddish crystalline powder; slightly soluble in water or alcohol.

tolil. $C_{16}H_{14}O_2$ = 238.11. Dimethylbenzil. A group of ketones; $MeC_6H_4CO.COC_6H_4Me$.

tolimidazole. $C_7H_6N_2$ = 118.1. The heterocyclic compound,



tolite. Trinitrotoluene.

tollalyl sulfide. Tolane sulfide.

Tollens, Bernhard. 1841– . A German agricultural chemist, noted as author. **T. reagent.** An ammoniacal solution of silver oxide, used in testing for aldehydes and ketones.

toloxy. Cresoxy. The monovalent radical, $Me.C_6H_4O$— or methylphenoxy group, from cresol.

tolu. Balsam of Tolu. The resinous exudation of *Myroxylon toluifera*, or *Toluifera balsamum*, a Leguminosae of tropical America; used medicinally as a stimulant and stomachic. **t. oil.** Albahaca oil.

tolualdehyde. C_8H_8O = 120.06. Toluic aldehyde. **α-** Phenylacetaldehyde, $PhCH_2CHO$. A liquid, d.1.027, b.194. **o-** Methylbenzaldehyde, $Me.C_6H_4CHO$. A liquid, d.1.039, b.-195.5. **m-** d.1.019, b.195. **p-** d.1.020, b.204.

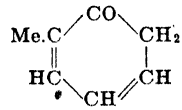
toluamide. C_8H_9ON = 135.1. (1) Carbamyltoluene. $Me.C_6H_4.CONH_2$. **ortho-** Colorless needles, m.139; slightly soluble in water, soluble in alcohol or ether. **meta-** Colorless crystals, m.94; slightly soluble in water. **para-** Colorless needles, m.158; slightly soluble in water, soluble in alcohol or ether; used in organic synthesis. (2) α-Phenylacetamide. $C_6H_5CH_2CONH_2$.

toluanilide. $C_{14}H_{13}NO$ = 211.11. α-phenylacetanilide, $PhNHCOCH_2Ph$. Colorless crystals, m.117.

toluene. C_7H_8 = 92.1. Toluol, methylbenzene, phenylmethane, PhMe. A colorless, benzene-like liquid, d_{15}°.0.871, m. −93.2, b.111; insoluble in water, soluble in alcohol or ether. It is obtained from coal tar and is used extensively as a solvent, in organic synthesis, in the manufacture of benzoic acid derivatives, and coal-tar products. For derivatives see *benzal, benzenyl, benzyl, benzylene, tolyl, tolylene.* **amino-** Toluidine. **aminohydroxy-** Cresidine. **bromo-** C_7H_7Br = 171.1. Monobromtoluene, MeC_6H_4Br. (1) *ortho-* A colorless liquid, d.1.41, b.182; soluble in alcohol, ether or benzene. (2) *para-* Pale red crystals; soluble in alcohol or benzene. *alpha-* Benzylbromide. **chloro-** C_7H_7Cl = 126.6. Monochloro-p-toluene. A colorless liquid, d.-1.073, b.161; soluble in alcohol or ether. *alpha-* Benzylchloride. **cyano-** C_8H_7N = 117.1. Toluic nitrile, $CN.C_6H_4Me$. (1) *para-* A yellow crystalline powder, m.28, b.218; soluble in alcohol, ether or benzene. (2) *ortho-* A brown liquid, b.203; soluble in alcohol, ether or benzene. *alpha-* Benzylcyanide. **diacetylamidoazo-** Dimazon. **dihydroketo-** Toluenone. **isopropyl-** Cymene. **nitro-** q.v. **nitroso-** C_7H_7ON = 121.1. Nitrosomethylbenzene, $NO.C_6H_4.M$ *ortho-* m.72; *meta-* m.53; *para-* m.48. **oxy** Cresol. **phenyl-** q.v. **trichloro-** Benzotrichloride. **trinitro-** q.v. **trinitro-*tert.*-butyl-** Artificial musk.

t. sulfonic acid. $C_7H_8O_3S$ = 172.1. $Me.C_6H_4.SO_3OH$. Cf. *tosyl. ortho-*, $2H_2O$ = 208.2. Colorless crystals, b.129; soluble in water or alcohol. *meta-* $.H_2O$ = 190.1. Colorless needles; soluble in water, alcohol or ether. *para-* $.4H_2O$ = 244.1. Colorless leaflets, m.107; soluble in water, alcohol or ether. *hydroxy-* Cresol sulfonic acid. **t. sulfonic amide.** $C_7H_9O_2NS$ = 171.18. $Me.C_6H_4.SO_2NH_2$. *ortho-* m.155; *meta-* m.107; *para-* m.137. **t. sulfochloride.** $C_7H_7O_2SCl$ = 190.61. $MeC_6H_4SO_2Cl$, used as a reagent for amines. **t. sulfonylchloride.** T. sulfochloride. *ortho-* m.10, $b._{10mm}$.126; *meta-* m.12; *para-* m.66, $b._{15mm}$.145.

toluenone. C_7H_8O = 108.1. The carbocyclic ketone,



toluenyl. The radical C_6H_5CH=. Cf. *toluylene, tolylene.*

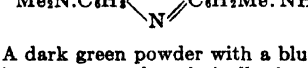
toluic acid. $C_8H_8O_2$ = 136.10. Methylbenzoic acid. The monobasic homolog of benzoic acid, $Me.C_6H_4.COOH$; three isomeric forms: *ortho-* Colorless needles, m.102, b.259; soluble in water, alcohol or ether. *meta-* Colorless prisms, m.110, b.263; slightly soluble in water, soluble in alcohol or ether. *para-* Colorless needles, m.176, b.275, soluble in water, alcohol or ether; used in organic synthesis. **alpha-** α- Phenylacetic acid, $Ph.CH_2.COOH$. Crystals, d.1.078, m.76.7, b.-265.5. **o-carboxy-** Homophthalic acid. **dihydroxy-α-** Homogentisic acid. **α-hydroxy-α-** Mandelic acid. **α-methyl-α-** Hydratropic acid. **methyl-** Xylic acid.

t. aldehyde. α-Tolualdehyde. **t. anhydride** $C_{16}H_{14}O_3$ = 254.2. o-Toluic acid anhydride, $(Me.C_6H_4CO)_2O$. Colorless crystals, m.36, b.-325; soluble in water. **t. nitrile.** Cyano*toluene.*

toluidide. One of a class of compounds derived from the toluidines by replacing one of the amino H atoms by an acyl radical; *e.g.*, $MeC_6H_4NHCOMe$, acetotoluidide.

toluidine. C_7H_9N = 107.12. Aminotoluene, $Me.C_6H_4.NH_2$. *ortho-* Colorless liquid, d.1.003, b.198. *meta-* Colorless liquid, d.0.989, b.203. *para-* Colorless leaflets, m.43, b.200; slightly soluble in water, soluble in alcohol or ether; used extensively in the synthesis of dyes and medicines. **acetyl-** Acetotoluide. **diethyl-** q.v. **methyl-** Xylidine. **nitro-** q.v. **thionyl-** q.v.

t. blue. $C_{15}H_{16}N_3SCl.ZnCl_2$. A double salt of zinc chloride and dimethyltoluthionine.



A dark green powder with a blue luster, soluble in water; used technically in dyeing textiles. Cf. *methylene blue, thiazine dyes, thionine.* **t. hydrochloride.** $C_7H_9N.HCl$ = 143.6. Pale red crystals; soluble in water or alcohol. **t sulfate.** $C_7H_9N.H_2SO_4$ = 205.1. Yellowish crystals; soluble in water or alcohol.

toluido. The monovalent radical MeC_6H_4NH— derived from toluidine.

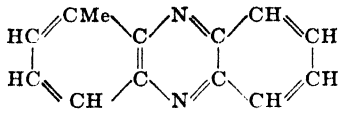
toluino. Toluido.

tolunitrile. Cyano*toluene.* **α-** Benzylcyanide.

toluol. Commercial toluene.

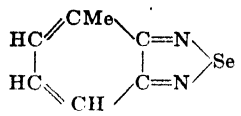
toluoyl. Toluyl.

toluphenazine. $C_{13}H_{10}N_2$ = 194.1. The heterocyclic compound,



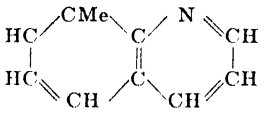
Colorless crystals, m.117. **dimethyldiamino-** Neutral red.

tolupiaselenole. $C_7H_6N_2Se$ = 197.2. The heterocyclic compound,



Colorless crystals, m.73, b.267.

toluquinoline. $C_{10}H_9N$ = 143.1. The heterocyclic compound,



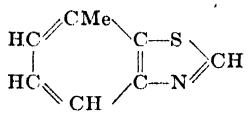
toluquinone. $C_7H_6O_2$ = 122.08. The solid, $MeC_6H_3:O_2$, m.67 (sublimes); soluble in alcohol or ether, insoluble in water. **methoxydihydroxy-** $C_8H_8O_5$ = 184.0.

A pigment produced from glucose by the fungus *Penicillium spinulosum.*

toluresitannol. $C_{16}H_{14}O_3OCH_3OH$. A constituent of tolu balsam.

tolurin. Vitamin B_1.

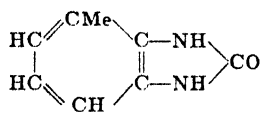
toluthiazole. C_8H_7NS = 149.1. The heterocyclic compound,



toluyl. Toluoyl. The monovalent radical, C_7H_7CO— or MeC_6H_4CO— (methylbenzoyl). Three isomers: o-, m-, p-. **alpha-** The monovalent radical, $PhCH_2CO$—.

t. aldehyde. C_8H_8O = 120.10. MeC_6H_4CHO. *ortho-* A liquid, b.200. *meta-* A liquid, b.199. *para-* A liquid, b.204. **t. azo-β-naphthol.** Scarlet R.

toluylene. (1) Tolylene, cresylene (6 isomers). The bivalent radical, $CH_3C_6H_3$=, derived from toluene. (2) Stilbene. **t. blue.** An oxidation-reduction indicator, q.v. **t. diamine.** $C_7H_{10}N_2$ = 122.1. The diamine, $CH_3C_6H_3(NH_2)_2$. **2.4-** Asymmetric diaminotoluene. Colorless needles, m.99, b.280; soluble in water, alcohol or ether. **2.3-** Colorless scales, m.61, b.255, soluble in water; used in organic synthesis. **2.5-** m.64, b.273. **2.6-** m.104. **t. diamine indophenol.** An oxidation-reduction indicator, q.v. **t. red.** Neutral red. **t. hydrate.** Stilbene hydrate. **t. urea.** $C_8H_8N_2O$ = 148.1. The heterocyclic compound,



Colorless crystals, m.290.

tolyantipyrine. Tolypyrine.

tolyl. (1) The monovalent radical, $CH_3.C_6H_4$—, or C_7H_7— derived from toluene; three isomers: o-, m-, and p-. **alpha-** Benzyl.

t. acetic acid. $C_9H_{10}O_2$ = 150.1. The monobasic acid, $CH_3.C_6H_4.CH_2COOH$. *ortho-* Colorless needles, m.88; soluble in water. *para-* Colorless needles, m.91, b.266; slightly soluble in water. **t. alcohol.** T. carbinol. **t. bromide.** Bromo*toluene*. **t. carbinol.** $C_8H_{10}O$ = 122.1. The monatomic alcohol, $CH_3.C_6H_4.CH_2OH$. *ortho-* Colorless needles, d.1.023, m.34, b.223; soluble in water, alcohol or ether. *meta-* A colorless liquid, d.1.036, m. −20, b.217; soluble in water or alcohol. *para-* Colorless needles, m.59, b.217; soluble in water, alcohol or ether. **t. chloride.** (1) Chloro*toluene*. (2) C_8H_9Cl. Xylyl chloride. **t. hydrazine.** $C_7H_{10}N_2$ = 122.08. Hydrazomethylbenzene $CH_3C_6H_4NHNH_2$. *ortho-* Colorless leaflets, m.56; soluble in water, alcohol or ether. *meta-* A liquid, b.245. *para-* Colorless tablets, m.65, b.240; soluble in water, alcohol or benzene. **t. hydrochloride.** $C_7H_{10}N_2.HCl.H_2O$ = 176.57. The hydrochloride of tolyhydrazine. *ortho-* Reddish crystals; soluble in water or alcohol. *para-* A brown powder, soluble in water or alcohol; used in organic synthesis. **t. hydroxylamine.** C_7H_9ON = 123.1. $CH_3.C_6H_4.NHOH$. *ortho-* Colorless leaflets, m.94, soluble in water, alcohol or ether; used in organic synthesis. **t. mercuric chloride.** C_7H_7HgCl = 327.12. Rhombic crystals, m.233, insoluble in water. **t. mustard oil.** C_8H_7NS = 149.2. Thiocyanomethyl-benzene, $CH_3.C_6H_4.NCS$. *ortho-* A yellowish liquid, b.238, insoluble in water, soluble in alcohol or ether. *para-* Colorless crystals, m.26, b.242, insoluble in water, soluble in alcohol or ether. **t. phenylketone.** Phenyltolylketone.

tolylene. The bivalent radical, $—C_6H_4.CH_2—$, which occurs in six isomers. **alpha-** Benzal. Cf. *toluylene.*

t. diamine. $C_7H_{10}N_2$ = 122.09. A group of isomeric compounds; as methylphenylene diamine, $NH_2CH_2\diagdown C_6H_4$, or diaminotoluene, $NH_2\diagup Me.C_6H_3(NH_2)_2$.

tolypyrine. $C_{12}H_{14}ON_2$ = 202.2. Tolyantipyrine, p-tolyldimethylpyrazole, $MeC_6H_4N(NMe.CMe:CH.CO)$. Colorless crystals, m.136; soluble in water or alcohol, insoluble in ether. Used medicinally as an antipyretic. **t. salicylate.** Tolysal.

tolysal. $C_{12}H_{14}ON_2$ = 202.2. Tolypyrine salicylate, $CH_3.C_6H_4.N(CO.CH:)NMe.CMe$. Small colorless crystals, m.101, insoluble in water, soluble in alcohol. Used medicinally as an antipyretic.

tombak. Any copper and zinc alloy.

ton. Unit of weight: 1 short ton = 2000 pounds = 907.18486 kg. (In common use in U.S.). 1 long ton = 2240 pounds = 1016.047 kg. (In common use in Britain). 1 metric ton (tonne) = 0.9842 long tons = 1.1023 short tons = 1000 kg. (in use in Continental Europe and non-English-speaking World.) **assay-** See *assay.*

refrigeration- The quantity of heat required to melt 2000 pds. of pure solid ice into water at 32°F; it equals 288,000 B.Th.U.

tonalite. A group of quartz, orthoclase and feldspathic rocks.

tonga. A mixture of the barks of *Rhaphidophora vitiensis* (Araceae) and *Premma taitensis*, (Verbenaceae) from the Pacific Islands. It contains tongine and an essential oil; is used as fluid extract for neuralgia. Cf. *tonka*.

tongine. An alkaloid from tonga.

tongs. A laboratory appliance for holding hot objects, such as crucibles, test-tubes or flasks.

Tongs.

tonic. An agent that increases vitality or restores vigor; as, iron, arsenic or gentian.

tonite. An explosive prepared from wet gun-cotton pulp (54 %) and barium nitrate (46 %).

tonka. Tonka bean, snuff bean. The dried seeds of *Coumarouna odorata* or *Dipteryx odorata*, a Leguminosae tree of Northern Brazil and Guiana. It contains coumarin and is used medicinally, as the fluid extract, as a cardiac stimulant, as an ingredient of perfumery and flavoring extracts, and in the manufacture of coumarin. Cf. *tonga*.

tonne. Metric ton.

tonquinol. $C_{11}H_{13}O_6N_3$ = 283.13. A colorless crystalline powder, used in perfumery as a substitute for musk.

toot poison. Tutin.

topaz. $Al_2SiO_4F_2$. A native aluminum fluosilicate, representative of a group of silica minerals (q.v.), and occurring in colorless or variously colored crystals. The transparent yellow variety is used as a precious stone. **false-** Quartz. **oriental-** Corundum.

topazolite. A yellow variety of iron garnet, q.v.

topochemical. (1) Referring to localized reactions which take place in the inner or outer fields of force of crystalline matter; as, ageing processes, or the building of crystals on a limited surface due to local supersaturation. (2) Reactions occurring in zones.

topochemistry. The study of localized reactions; as in colloidal systems. Cf. *zone, protoplasm*.

toramin. The ammonium salt of trichlorbutyl-malonate; used medicinally as a substitute for opium.

torbanite. A variety of cannel coal (q.v.), having a high ash.

torbernite. A hydrated copper, uranium phosphate. Cf. *chalcophyllite*.

tori seed oil. Mustard seed oil.

tormentil. Tormentilla, septfoil. The dried rhizome of *Potentilla tormentilla*, a Rosaceae of Europe and Northern Asia. It contains a red coloring matter, tormentil tannic acid, and quinovic acid; used for tanning leather and medicinally, as an astringent. Cf. *five-finger glass*. **t. tannic acid.** $C_{26}H_{22}O_{11}$ = 510.2. A constituent of tormentil; an amorphous red brown powder, used in tanning.

tornesite. A chlorinated rubber product. White powder, turning brown at 150°C., and resistant to common solvents and reagents.

torque. The force of or resistance to a twisting motion.

Torricelli, Evangelista. 1608–1647. An Italian inventor, assistant of Galilei, noted for construction of barometers, microscope and telescope.

torsion. The act of producing a strain by twisting or rotating at right angles to the length of a material.

torula. Mycoderma. A variety of yeast (fungi imperfectii) having a chain-like cell formation, in milk and beer.

torulin. Vitamin B_1.

tosyl. Abbreviation for the p-toluene sulfonyl radical.

totaquina. An anti-malarial evolved by the Malaria Commission of the League of Nations, which contains at least 75 % of crystallisable cinchona bark alkaloids, including at least 15 % quinine. It is equal in efficiency to, but much cheaper than quinine.

touch. The sense of feeling. **hard-** A t. like that of crystals of inorganic salts. **soft-** A t. like that of phthalic anhydride or bees-wax. **slippery-** The effect produced by alkali hydroxides. **unctuous-** A fatty feel due to substances such as soapstone or ointments.

touchstone. (1) Jasper. (2) A hard black stone, on which a streak is made with a gold alloy. It is treated with hydrochloric and nitric acids and water in succession, and the resultant streak compared with a standard streak gives an approximate value of the alloy. Cf. *streak test*.

Toulet's solution. A concentrated solution of mercury potassium iodide, d.3.17; used for the separation of minerals.

tourmaline. Brazilian sapphire, schorl, rubellite. A group of aluminum silicates in various colors containing boron and lithium. (Cf. *silica minerals*.) The red, blue, green and colorless t. are used as gems. Tourmalines are mixtures of aluminum borate with alkali, magnesium or iron silicates and frequently contain chromium, manganese, calcium and fluorine. They are doubly refractive and are used in optical instruments (polariscopes). See *aphrizite, achroite, indicolite*. **artificial-** Herapathite.

tower. A tall structure used for absorption, scrubbing, cooling or distilling.

towsagis. Mountain gum. A Russian plant used for making rubber.

toxalbumin. A poisonous albumin *e.g.*, in cobra venom. Cf. *sozalbumin*.

toxamins. A group of substances of unknown chemical composition that exist in minute quantities in different foods and are harmful to well-being. Antonym: *vitamins*.

toxemia. Blood-poisoning, or poisoning caused by substances produced by body-cells or microorganisms.

toxic. Poisonous or pertaining to poisons. **t. dose.** A dose that produces the characteristic symptoms of poisoning. **t. equivalent.** The smallest amount of a substance required to kill an animal, divided by the weight of the animal.

toxicarol. (1) $C_{23}H_{22}O_7$ = 410.19. Yellow crystals, optically-inactive, m.219, from the roots of *Tephrosia (Cracca) toxicaria*, of South America; used as a fish poison. (2) A second, unnamed principle, $C_{33}H_{22}O_6$ = 394.19. Greenish crystals, m.171, occurring also in derris (q.v.) and cube, q.v. Cf. *rotenone*.

toxicity. The degree of being poisonous; the ratio between the smallest amount that will cause the

death of an animal and the weight of the animal (toxic equivalent).

toxicodendrol. A poisonous liquid from toxicodendron.

toxicodendron. The dried poisonous leaves of *Rhus toxicodendron* (see *rhus*).

toxicology. A branch of science that deals with the actions, detection and treatment of poisons and poisonings.

toxigenes. Chemical products which, when injected into an animal, are not poisonous until modified by the vital activity of the cells; as ptomaines. Cf. *toxins*.

toxin(e). The soluble substances produced during bacterial growth that stimulate the formation of antitoxins (cf. *toxigenes*). **t. formation.** The production of poisonous substances from proteins of the living body by the action of bacteria: (1) *Phytotoxins* or *vegetable* toxins; such as, abrin, crotin, ricin and pollen. (2) *Zootoxins* or *animal* toxins, as t. of the toad, spider, snake, scorpion or bee. (3) *Bacteriatoxins* or toxins proper; as, t. produced by diphtheria, tetanus, botulism, cholera or coli bacteria. **t. immunity.** The production in the living body of antitoxins that counteract the effects of vegetable or animal toxins. (See *Ehrlich side-chain theory*.)

toxisterol. A sterol produced by irradiation of calciferol.

toxoflavin. An antibiotic substance produced by *Bacterium cocovenenans*.

toxoid. A toxin that has been deprived of its poisonous toxophore. (See *Ehrlich side-chain theory*.) It is a degenerated toxin, chemically modified so as to produce immunity, but not disease.

toxone. A toxin made less poisonous by partial combination with an antitoxin; a mixture of toxins with neutralized toxins (*toxoids*).

toxophore. The poisonous radical in a toxin molecule that reacts with the living protoplasm and forms a stable compound (*paraplasm*). Cf. *constellation*.

trace. A very small quantity of a substance; usually when present in a concentration of less than 5γ per gm.

tracer. A mixture of calcium resinate with magnesium, rare earth nitrates and glue; used in projectiles to make their path visible. **t. element.** A radioactive indicator, q.v.

tracheid. Fiber. An elongated cell from woody plants, containing varying amounts of lignin, and characterised by bordered pits or discoid markings which vary according to its origin.

track. The path described by a particle (*e.g.*, as, α-, β-rays, or protons, electrons, ions or molecules), made visible in a cloud chamber. Cf. *Wilson tracks, Brownian movement*.

tractive force. The power of pulling or drawing; as, of a magnet.

tragacanth. Gum dragon. The gummy exudation from the stems of *Astragalus gummifer* and other Astragalae species of the Leguminosae family native to Asia Minor. It contains bassorin, pectin and starch; used as an emulsifier and adhesive in pharmacy, the textile industry and by cigar makers. Cf. *bandoline, xylan-bassoric acid*. **Indian-** Sterculia gum.

tragacanthin. The carbohydrate of tragacanth, a polysaccharide hydrolyzing to pentosans.

tragon. Locust kernel gum from carob beans.

train. A connected arrangement of several chemical instruments; as, the combustion train in organic analysis.

trans- A prefix derived from the Latin and indicating "across." **t.-form.** An axially-stereoisomeric form of a compound; cf. *cis*:

trans-form *cis*-form

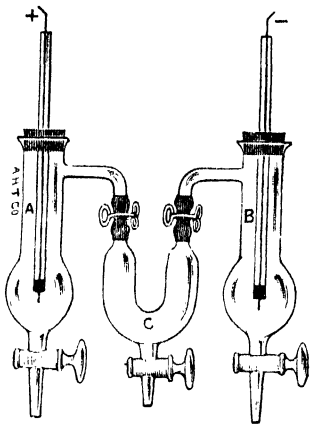
transamination. The reversible transference of amino groups by enzymes (transaminase, aminopherases, q.v.) into ammodicarboxylic acids and keto-acids.

transaudient. Permitting sound waves to pass through.

transcalent. Permitting heat waves to pass through.

transcrystallization. The formation of crystals so that their principal axes are perpendicular to the direction of flow of heat.

transfer. The conveyance of matter or energy from one location to an other. **t. number.** Transport number. **t. pipet.** A pipet that measures one definite volume of liquid. It has only one graduation mark and differs from measuring pipets, which have many graduations.



Transference cell.

transference. Transfer. **t. cell.** Hittorf cell. An electrolytic cell with a detachable center portion; used to determine the change of concentration of an electrolyte during electrolysis. **t. numbers.** Transport numbers.

transformation. A change in form, structure or internal arrangement of atoms. Cf. *nuclear reaction, radio-elements*. **radioactive-** See *radioactivity*.

t. constant. The fraction of radioactive material that disintegrates each second. **t. series.** See *radioactive* disintegration. **t. theory.** Electromagnetic radiations have corpuscular aspects (*e.g.*, Compton effect, light pressure), and the motion of matter has undulatory aspects (*e.g.*, electron scattering, where $\lambda = h/mv$). Cf. *Planck's constant, mass-energy cycle, quantum*.

transformer. A device for changing the electric potential or nature of an electric current; as, *step-down* transformer (higher to a lower potential) and *step-up* transformer (lower to a higher potential). It may also change the phase of the current, or convert it from alternating to direct, or the reverse. Cf. *rectifier*.

transition. A change from one state or form to another state or form; as, melting, boiling or a

change from one to another crystalline, allotropic or enantiomorphic form. **t. elements.** The three trios of elements in the periodic table which are grouped together, and connect the odd series 4, 6, and 8 with the following even series, viz.: (*A*) Fe, Co, Ni; (*B*) Ru, Rh, Pd; (*C*) Os, Ir, Pt. **t. interval.** The pH range over which the color change of an indicator takes place. Cf. *pT*. **t. point.** The temperature at which a transition occurs.

translucent. Semi-transparent; permitting the partial passage of light. Cf. *radiolucent, opaque, transparent.*

transmissibility. The capacity of a substance to allow the passage of light; the absorption by it of light of certain wave-lengths. It may be qualitative (color-screens) or quantitative (translucence).

transmutation. (1) A change of one element into another element; as, in radioactive disintegration or in alchemical notions. In the latter case transmutation always indicated a change from a base to a noble metal (gold). Cf. *atom building.* (2) Artificial. A change from one element into another by bombardment with fast-moving protons, deutons or alpha-particles, q.v. Cf. *radioelements, nuclear reactions, proton bombardment, neutron.*

transparency. The property of permitting the passage of rays of radiations; *e.g.:*
glass—transparent to visible light,
rock-salt—transparent to heat, visible, and ultra-violet rays,
white fluorite—transparent to infra-red, visible, and ultra-violet rays,
paraffin—transparent to Hertzian rays,
thin metals—transparent to gamma rays (Al to x-rays, Ag to ultra-violet rays, etc.).
Antonym: *opacity.*

transparent. Describing a substance through which one can see; or which permits the passage of rays of the visible spectrum. Antonym: opaque. Cf. *radiopaque, translucent.*

transpiration. The exhalation of water vapor by a plant or animal through its surface tissue or skin. Cf. *respiration.*

transport number. Transference number, Hittorf number (n). The relative migration-velocities of the anion and cation of an electrolyte. If u and v are the migration velocities of the anion and cation, respectively, then the corresponding transport numbers are:

$$n(\text{anion}) = v/(u + v),$$
$$(1 - n)(\text{cation}) = u/(u + v).$$

During electrolysis the ratio of the fall in concentration round the anode to that round the cathode is $n/(1 - n)$.

transposition. An atomic displacement within a molecule by which one atom changes place with another atom of the same molecule.

transudate. Liquid which has passed through a living tissue. Cf. *osmosis.*

transuranium. The elements, unknown so far, of atomic weights higher than that of uranium. It is calculated that 98 % of the universe consists of these elements, and that the known elements of our earth and those found by spectrum analysis constitute only 2 %. They are supposed to exist in the interior of stars. Cf. *hypon.* By bombardment of uranium, ekarhenium and ekaosmium, (q.v.) have been synthesized (1935).

trapezeum. A plane figure bounded by four straight lines, no two of which are parallel.

trapezohedron. A crystal of six, eight, or twelve faces, having unequal intercepts on all the axes.

trapezoid. A plane figure bounded by four straight lines, one pair of which are parallel.

trass. A natural pozzolana, q.v.

Traube Isidor. 1860–1943. A German chemist noted for work in colloids and capillary phenomena. **T. stalagmometer.** A stalagmometer (q.v.) for determination of the surface tension of fluids; used in biochemical investigations. **T.'s rule.** The adsorption of organic substances from aqueous solutions increases strongly and regularly in a homologous series with an increasing number of carbon atoms.

traumatol. C_7H_7OI = 234.3. Iodocresol, iodocresine. $CH_3C_6H_2I.OH$. A purplish-red powder, used as an iodoform substitute.

traversal. The path of a particle made visible by a track, q.v.

traversellite. Augite which contains Al_2O_3.

travertine. $CaCO_3$. Calcareous sinter, onyx. A native calcium carbonate, usually banded similarly to marble. Cf. *tufa.*

treacle. Molasses.

Treadwell, Frederick P. 1857–1918. An English chemist, noted for analytical methods.

treble. Triple.

trehalase. An enzyme of fungi that hydrolyses trehalose.

trehalose. $C_{12}H_{22}O_{11}$ = 342.2. A disaccharide from manna, yeast, mushrooms (trehala) and ergot. White crystals, m.210, $[\alpha]_D$ + 197°. It hydrolyzes to glucose and is used to differentiate paratyphoid bacteria. Cf. *mycose.*

treibgas. Calorgas.

tremolite. $3MgO,SiO_2,CaSiO_3$. A white or green native amphibole; a silica mineral, q.v.

trephone. Secretions from leucocytes which stimulate tissue repair in the healing of wounds.

trester. The residue remaining after pressing grapes. **t. fermentation.** The fermentation of diluted grape-residues, with or without addition of sugars.

tri- A prefix derived from the Latin indicating "three." See *ter-.*

triacetamide. $N.(C_2H_3O)_3$ = 143.11. A solid, m.78, soluble in ether.

triacetate. A compound whose molecule contains three acetate radicals, $(CH_3COO—)_3$.

triacetin. $C_9H_{14}O_6$ = 218.2. Glyceryltriacetate, $(MeCOO)_3C_3H_5$. An oily liquid from cod-liver oil, butter and other fats, d.1.161, b.258; slightly soluble in water soluble in alcohol or ether. Cf. *acetin.*

triacetonediamine. $C_9H_{20}N_2O$ = 172.2. *2.6*-Diamino-*2.6*-dimethylheptanone-4; bis (*2*-aminoisobutyl) ketone, $(NH_2CMe_2.CH_2)_2CO$. A reaction-product of ammonia and acetone.

triacontane. $C_{30}H_{62}$ = 422.5. A solid hydrocarbon isolated from the roots of *Oenanthe crocata*, an umbelliferous plant, m.66.

triad. (1) A group of three related elements or compounds; as, the triad Cl, Br, and I, or a group of three tautomeric compounds. (2) A trivalent atom or radical. (3) In crystallography, a crystal which shows 3 similar faces as it is rotated about its axis of symmetry through 360°.

triallylamine. $C_9H_{15}N$ = 137.1. The tertiary amine, $N(C_3H_5)_3$. A colorless, oily liquid.

triamido. Triamine.

triamine. A compound of the type, $R(NH_2)_3$. It differs from the tertiary amine, NR_3.

triaminoazobenzene. $C_{12}H_{13}N_5$ = 227.2. Aniline brown, Manchester brown, Vesuvin, Bismarck brown, $NH_2.C_6H_4N:N.C_6H_3(NH_2)_2$. A red or dark brown powder, m.143; soluble in water, alcohol or ether. Used as dye for leather, cotton or wool; as a bacteriological stain; and for determining the decolorizing power of charcoal.

triaminobenzene. $C_6H_9N_3$ = 123.1. $C_6H_3(NH_2)_3$. **1.2.3-** m. 103, b.330. **1.2.4-** m. below 100, b.340. Both are very soluble in water, alcohol or ether.

triamorph. A substance that crystallizes into three different types of crystals; described as trimorphous.

triamylamine. $C_{15}H_{33}N$ = 227.1. $N(C_5H_{11})_3$. A white solid, used as an antioxidant, solvent, in the rubber industry and for flotation.

triangle. A plane figure, bounded by three straight lines, pairs of which meet at three points. **reference-** See *diagram.*

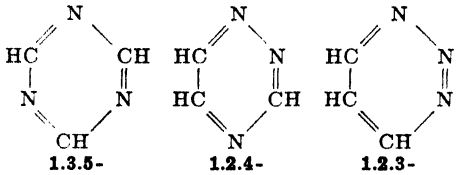
triatomic. Describing: (1) A molecule that consists of three atoms. (2) An acid that has three replaceable hydrogen atoms. (3) A base, alcohol or phenol that has three hydroxyl groups.

triazane. (1) Hydrazoamino. The monovalent radical —NH.NH.NH_2. (2) Prozane, NH_2.NH.NH_2; in which the H is replaceable by hydrocarbon radicals. Cf. *hydronitrogen.*

triazene. (1) The monovalent radical —NH.N:NR. (2) Diazoamine, NH_2,N:NH, in which the H is replaceable by hydrocarbon radicals. Cf. *hydronitrogen.*

triazeno. The monovalent radical, $NH_2N:N$—.

triazine. $C_3H_3N_3$ = 81 03. The heterocyclic compounds,



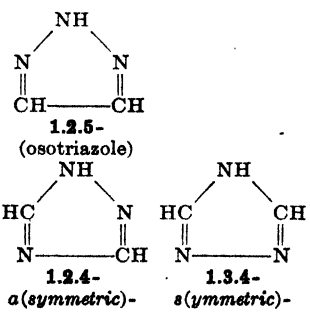
1.3.5- s(ymmetric)- (kyanidine) **1.2.4-** a(symmetric)- **1.2.3-** v(icinal)-

t. triol. Cyanuric acid.

triazinyl. The monovalent radical, $C_3H_2N_3$—, derived from triazine.

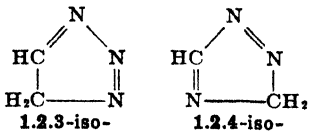
triazo. Azide. Trinitride. The monovalent group —N<N=N **t. benzene.** Phenyl azide.

triazole. $C_2H_3N_3$ = 69.06. Pyrrodiazole. The heterocyclic compounds,



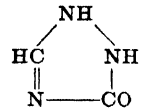
1.2.5- (osotriazole) **1.2.3-** v(icinal) **1.2.4-** a(symmetric)- **1.3.4-** s(ymmetric)-

1.2.4- Common triazole, pyrro-[ab″]-diazole. Colorless needles, m.120, b.260; soluble in water or alcohol. **benzo-** See *benzotriazole.* **diphenyl-** See *diphenyltriazole.* **iso-**



1.2.3-iso- **1.2.4-iso-**

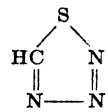
triazolone. $C_2H_3ON_3$ = 85.1. Ketotriazole. The heterocyclic compound,



1-phenyl-..... m.183
1-phenyl-5-methyl-..... m.167, b.300
1-phenyl-5-ethyl-..... m.192

triazolyl. The monovalent radical, $C_2H_2N_3$—, derived from triazole.

triazsulfole. CHN_3S = 87.11. Thio [a,b,b'] triazole. The heterocyclic compound,



E.g., 5-ethylamido-, $Et_2N(CN_3S)$, m.67; 5-allylamido-, $C_3H_5N(CN_3S)$, m.54.

tribasic. Describing a molecule that has three replaceable hydrogen atoms, or produces three hydrogen ions in solution.

tribenzal. Indicating 3 benzal radicals, Ph.CH=.

tribenzo-p-diazine. Naphthophenazine.

tribenzoylmethane. $C_{22}H_{16}O_3$ = 328.24. $(Ph.CO)_3CH$. Colorless crystals, m.225 (sublime), soluble in water, alcohol or ether.

tribenzyl. Indicating the presence of 3 benzyl radicals, $Ph.CH_2$—. **t. amine.** $C_{21}H_{21}N$ = 287.28. The solid, $N(C_6H_5.CH_2)_3$, m.91, soluble in water or ether, slightly soluble in alcohol. **t. ethyl tin.** $EtSn(CH_2Ph)_3$ = 420.90. White crystals, m.31, soluble in organic solvents. **t. tin chloride.** $(PhCH_2)_3SnCl$ = 427.32. White needles, m.142, insoluble in water. **t. tin hydroxide.** $(PhCH_2)_3SnOH$ = 408.87. Rhombic crystals, m.120, soluble in organic solvents.

tribenzylidene diamide. Hydrobenzamide.

tribo-. A prefix derived from the Greek, indicating "friction" or "rubbing."

triboelectric series. An arrangement of substances in a list so that any substance, when rubbed by a substance following it in the list, becomes positively electrified: (+) asbestos, hair (rabbit's fur), glass, wool, calcite, silk, cotton, magnalium, wood, amber, slate, ebonite, sulfur, celluloid, rubber, (−). Cf. *electromotive series.*

triboluminescence. The phenomenon shown by substances, especially crystals, of emitting light when crushed, rubbed, or mechanically pressed together. Cf. *luminescence.*

tribromide. A binary compound that contains three bromine atoms in the molecule.

tribromo-, tribrom- A prefix indicating that a compound contains three bromine atoms in its molecule. **t. acetaldehyde.** Bromal. **t. acetic acid.** $C_2HO_2Br_3$ = 296.78. CBr_3COOH. Colorless leaflets, m.135, decomp. 250; soluble in water, alcohol or ether. Used in organic

synthesis. **t. aniline.** $C_6H_4NBr_3$ = 329.83. Aniline-tribromide, 1-amino-2.4.6-tribromo-benzene, $NH_2C_6H_2Br_3$. Small needles, m.119, b.300, insoluble in water, soluble in alcohol or ether; used medicinally for neuralgia. **t. benzene.** $C_6H_3Br_3$ = 314.8. Symmetrical, or **1.3.5**-tribrombenzene. Colorless needles, m.-119, b.278, insoluble in water, slightly soluble in alcohol. **1.2.3**-. m.87, **1.3.4**-. m.44, b.275. **t. ethane.** $C_2H_3Br_3$ = 266.77. **1.1.2**-. or *β*-. $BrCH_2.CHBr_2$. A liquid, d.2.579, m.-−26, b.188. **t. ethanol.** Avertine. **t. ethylene.** C_2HBr_3 = 264.76. $BrCH:CBr_2$. A liquid, d.2.708, b.164. **t. hydriné.** Allyltribromide. **t. methane.** Bromoform. **t.-β-naphthol.** $C_{10}H_4Br_3OH$ = 380.9. A gray crystalline powder, soluble in alcohol or ether; used medicinally as a disinfectant. **t. phenol.** $C_6H_3Br_3O$ = 330.8 (2:4:6-). Bromol. Soft, white, colorless needles, m.92 (sublime), slightly soluble in water, soluble in alcohol, ether or benzene. Used as a disinfectant and antiseptic. **t. phenol bismuth.** Xeroform. **t. phenyl salicylate.** Cordol. **t. resorcinol.** $C_6H(OH)_2Br_3$ = 346.81. Colorless needles, m.-112, slightly soluble in water, soluble in alcohol or ether. **t. salol.** $C_{13}H_7O_3Br_3$ = 450.7. Cordol, tribromphenylsalicylate, $C_6H_4OHCO-OC_6H_2Br_3$. Colorless crystals, slightly soluble in water; used medicinally as an antiseptic.

tributylamine. $C_{12}H_{27}N$ = 185.3. The tertiary amine, NBu_3. A colorless liquid, d.0.778, m.−71, b.216; insoluble in water, soluble in alcohol or ether. **iso-** $N(CH_2CHMe_2)_3$. A colorless liquid, d.0.766, m.−22, b.191.

tributyrin. Butyrin.

tricalcium phosphate. See *calcium phosphate.*

tricaprin. $C_{33}H_{62}O_6$ = 560.48. Glyceryl tricaprinate, $(C_9H_{21}COO)_3C_3H_5$. Triclinic crystals, d.0.921, m.31, insoluble in water.

tricaproin. $C_{21}H_{38}O_6$ = 386.27. Glyceryl tricapronate, $(C_5H_{11}COO)_3C_3H_5$. A colorless liquid, d.0.988, m.−25, insoluble in water.

tricapryllin. $C_{27}H_{50}O_6$ = 470.39. Glyceryl tricapryllate, $(C_7H_{15}COO)_3C_3H_5$. Colorless liquid, d.0.954, m.8, insoluble in water.

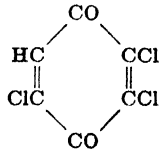
tricarballylic acid. $C_6H_8O_6$ = 176.1. Propane tricarboxylic acid, $CH_2COOH.CHCOOH.CH_2-COOH$. Colorless rhombic crystals, in beet molasses, m.166, decomp. by further heat, soluble in water, alcohol or ether. *β*-**hydroxy-** Citric acid.

tricetin. $C_{15}H_{10}O_7$ = 302.1. *5.7.3′.4′.5′*-Pentahydroflavone. A pigment from wheat.

trichinae. A race of food parasites.

trichloride. Terchloride. A binary compound that contains three chlorine atoms in its molecule.

trichloro-, trichlor- A prefix indicating that a compound contains three chlorine atoms in its molecule. **t. acetal.** $C_6H_{11}O_2Cl_3$ = 221.5. $(EtO)_2CH.CCl_3$. (1) A colorless liquid, d.1.288, b.197, soluble in water, alcohol or ether. (2) A solid, m.83, b.230. **t. acetamide.** $C_2H_2-ONCl_3$ = 162.4. $CCl_3.CONH_2$. Colorless leaflets, m.141, b.239; insoluble in water, soluble in alcohol or ether. **t. acetic acid.** $C_2HO_2-Cl_3$ = 163.4. $CCl_3.COOH$. Colorless rhombic crystals, $d_{60°}$.1.630, m.57, b.195, soluble in water, alcohol or ether. Used as a reagent, as a general test for unsaturated compounds and also in organic synthesis. **t. acetyl-chloride.** C_2OCl_4 = 181.8. $CCl_3.COCl$. A colorless liquid, b.118, soluble in alcohol; used in organic synthesis. **t. aldehyde.** Chloral. **t. benzenes:** $C_6H_3Cl_3$ = 181.43. Colorless solids or liquids, insoluble in water, soluble in alcohol or ether. **1.3.5.**- (asymmetric) m.63, b.209; **1.2.4.**- $d_{10°}$. (liq.) 1.466, m.17, b.213. **1.2.3.**- m.52, b.219, $d_{10°}$ (solid) 1.574. **t. butylalcohol.** Chloretone. **t. butylaldehyde.** Butylchloral. **t. butylmalonate.** Toramin. **t. ethane.** $C_2H_3Cl_3$ = 133.41. *alpha*- Methylchloroform, $MeCCl_3$. A colorless liquid, d.-1.325, b.75, insoluble in water, soluble in alcohol or ether; used medicinally as an anesthetic. *beta*- $CHCl_2.CH_2Cl$. A colorless liquid, d.1.478, b.114, insoluble in water, soluble in alcohol or ether. **t. ethanol.** $C_2H_3Cl_3O$ = 149.4. Trichlorethylalcohol, $CCl_3.CH_2OH$. Colorless rhombic tablets, m.18, b.151, slightly soluble in water, soluble in alcohol or ether. **t. ethylalcohol.** Trichlorethanol. **t. ethylene.** C_2HCl_3 = 131.4. 1-chloro-2-dichloroethylene. $CHCl:CCl_2$. A colorless liquid, d.1.459, m.-−70, b.87; insoluble in water, soluble in alcohol or ether. Used in organic synthesis, dry cleaning, and degreasing, as a refrigerant, in the manufacture of perfumes, paints and varnishes, for the extraction of fats, caffeine and nicotine, and as an inhalation anesthetic, particularly for angina pectoris. **t. ethylurethane.** Voluntal. **t. hydrin.** $C_3H_5Cl_3$ = 147.4. Allyltrichloride, trichloropropane, glycerylchloride, glyceryltrichlorohydrin $CH_2Cl.CHCl.CH_2Cl$. A colorless liquid, d.1.417, b.158, insoluble in water; used medicinally as a hypnotic and anesthetic. **t. hydroquinone.** $C_6H_3O_2Cl_3$ = 213.4. $C_6H-(OH)_2Cl_3$. Colorless prismatic crystals, m.134, soluble in water, alcohol or ether. **t. lactic acid.** $C_3H_3O_3Cl_3$ = 193.42. $CCl_3.CHOH.-COOH$, m.116, and soluble in water, alcohol and ether. **t. methane.** Chloroform. **t. methylchloroformate.** $C_2O_2Cl_4$ = 197.8. Diphosgene. $C_3Cl.COOCl$. A colorless liquid, b.127. A lung-irritant poison gas. **t. phenol.** $C_6H_3-OCl_3$ = 197.43. $C_6H_2(OH)Cl_3$, 1-Hydroxy-2.4.6-trichlorbenzene. Colorless rhombic crystals, m.68, b.244, soluble in water, alcohol or ether; used medicinally as an antiseptic and disinfectant. **1:2:3:5**- m.53, b.252. Slightly soluble in water, very soluble in alcohol or ether. **t. propane.** Trichlorohydrin. **t. quinone.** $C_6HO_2Cl_3$ = 211.5.



Yellow leaflets, m.165; insoluble in water, soluble in alcohol or ether. **t. toluene.** Benzotrichloride. **t. triethylamine.** $N(C_2H_4Cl)_3$ = 204.5. An irritating liquid, causing blisters.

trichodesmine. $C_{18}H_{27}NO_6$ = 353.2. An alkaloid, m.202 (decomp.), from *Trichodesma incanum*, a Boraginaceae.

trichroism. A phenomenon shown by certain minerals or crystals of having three different colors when viewed at different angles.

trichromatic. Three colors (q.v.). **t. analysis.** The matching of colors in terms of three primary components: red, green and blue.

tricin. $C_{17}H_{14}O_7$ = 330.1. *5,7,4*-Trihydroxy-*3′,5′*-dimethoxy flavone. A dimethylether of tricetin, a pigment in the leaves of wheat,

especially the variety khopli, *Triticum dicoceum*. Yellow needles, m.292, insoluble in water or benzene, soluble in alcohol, ether and acetic acid.

triclene. Trade name for trichloroethylene.

triclinic. Anorthic, asymmetric. A crystal that has three unequal, long axes at oblique angles to one another. See *crystal system, prisms, pyramids.*

tricosane. $C_{23}H_{48}$ = 324.37. The hydrocarbon, $Me(CH_2)_{21}Me$. A crystalline solid, d.0.779, m.47.7, b.320.7.

tricosanoic acid. See *cosanic acids.*

tricosanol. See *cosanols.*

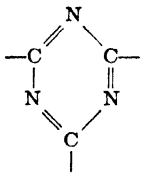
tricosoic acid. A group of isomers, $C_{22}H_{45}COOH$. **n-** Tricosanoic acid.

tricresol. A mixture of *o-*, *m-*, and *p-* cresols.

tricresyl. Indicating the presence of 3 cresol radicals. **t. phosphate.** $C_{21}H_{21}O_4P$ = 368.19. Lindol, tri-*p*-cresylphosphate, $(C_6H_4Me)_3PO_4$. Colorless odorless liquid, d.1.18, m. exceeds −25 (if pure m.77°C), b. exceeds 340; used as a plasticizer for lacquers, dopes, coating solutions, waterproofing paper and fabrics, and for softening resins and rubber. It causes "ginger paralysis."

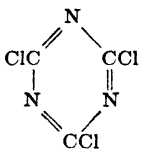
tricyanic acid. Cyanuric acid.

tricyano- Describing members of a group of compounds that contain, in their molecules, the ring,



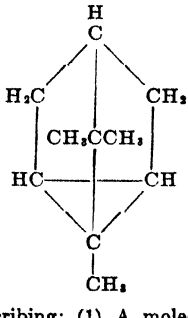
They are derived from cyanocompounds by polymerisation.

tricyanogen chloride. $C_3N_3Cl_3$ = 184.4. Cyanuric chloride. The heterocyclic compound,



Colorless crystals, m.146, b.190; slightly soluble in water, soluble in alcohol or ether. It is a polymer of cyanogen chloride.

tricyclene. $C_{10}H_{16}$ = 136.12. A tricyclic terpene:



tricyclic. Describing: (1) A molecule that contains three rings of atoms; as, anthracene, diphenylbenzene. (2) A ring of three atoms.

tridecane. $C_{13}H_{28}$ = 184.3. A saturated hydrocarbon of the methane series. Colorless liquid, d.0.757, m.−6, b.234; insoluble in water, soluble in alcohol or ether.

tridecanoic acid. $C_{13}H_{26}O_2$ = 214.20. Tridecylic acid, *n*-tridecoic acid, ficocerylic acids $C_{12}H_{25}COOH$, in figs and coconuts. Colorless crystals, m.51, $b._{100mm}$236.

tridecanol. Tridecyl alcohol.

tridecoic acid. An isomer of $C_{12}H_{25}COOH$. **n-** Tridecanoic acid. **cyclopentyl-** Chaulmoogric acid.

tridecyl. The monovalent radical, $C_{13}H_{27}$—, derived from tridecane. **t. alcohol.** $C_{13}H_{28}O$ = 200.22. *n*-Tridecanol, $C_{13}H_{27}OH$. Crystals, d.0.822, m.30.5, $b._{15mm}$156. **t. amine.** $C_{13}H_{29}N$ = 199.23. *n*-Aminotridecane. Crystals, m.27, b.265.

tridecylene. $C_{13}H_{26}$ = 182.3. An unsaturated hydrocarbon of the ethylene series. A colorless liquid, d.0.845, b.233; insoluble in water, soluble in alcohol or ether.

tridecylic acid. Tridecoic acid.

tridiphenylmethyl. The "free radical" compound, $(Ph.C_6H_4)_3C$, occurring in colorless crystals that form a colored solution.

tridymite. SiO_2. A native, hexagonal, crystalline form of silica (quartz), d.2.26, stable below 1470°C. It is also formed when quartz or cristabolite is heated at 870–1470°C; it has three crystalline forms.

trieline. Trichloromethylene.

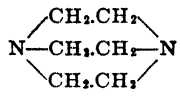
-triene. Suffix indicating three double bonds.

triethanolamine. $C_6H_{15}NO_3$ = 149.12. $\beta.\beta',\beta''$-Trihydroxytriethylamine, $N(C_2H_4OH)_3$. A colorless liquid, $d._{20°}$1.124, $b._{150mm}$227, soluble in water. Used as a basis for soaps and the emulsification of oils, waxes and paraffins; and as a reagent for antimony and tin.

triethoxy. Indicating 3 ethoxy radicals, EtO—. **t. boron.** $B(OC_2H_5)_3$ = 145.94. A colorless liquid, d.0.864, b.120.

triethyl- A prefix indicating the presence of three ethyl radicals in the compound. **t. amine.** $C_6H_{15}N$ = 101.2. The tertiary amine, NEt_3. A colorless liquid, d.0.733, b.89; soluble in water, alcohol or ether. It is a ptomaine in decaying fish. **t. arsine.** $C_6H_{15}As$ = 162.1. $AsEt_3$. A colorless liquid, d.1.152, $b._{735mm}$.140, soluble in alcohol. **t. benzene.** $C_{12}H_{18}$ = 162.20. The hydrocarbon, $C_6H_3Et_3$ (1.3.5). A colorless liquid, d.0.864, b.218; insoluble in water, soluble in alcohol or ether. **t. bismuthine.** $C_6H_{15}Bi$ = 296.12. Bismuth ethyl, $BiEt_3$. Colorless liquid, d.1.82, $b._{79mm}$107, insoluble in water, soluble in organic solvents. **t. boron.** $C_6H_{15}B$ = 97.94. Boron ethyl, BEt_3. Colorless liquid, d.0.6961, b.95, insoluble in water. **t. carbinol.** $C_7H_{16}O$ = 116.2. The tertiary alcohol, CEt_3OH. A colorless liquid, d.0.84, b.141; soluble in water, alcohol or ether. **t. gallium.** $C_6H_{15}Ga$ = 156.85. Gallium ethyl, $GaEt_3$. Colorless liquid, d.1.0576, m.−82.3, b.142.6, decomp. by water. **t. phosphine.** $C_6H_{15}P$ = 118.2. PEt_3. A colorless liquid, d.0.812, b.127; insoluble in water, soluble in alcohol or ether. Used as a reagent for carbon disulfide in illuminating gas. **t. phosphite.** $(C_2H_5)_3PO_3$ = 166.2. A colorless liquid, b.155; insoluble in water, soluble in alcohol or ether. **t. silicoformate.** $SiH(OEt)_3$ = 164.43.

triethylenediamine. $C_6H_{12}N_2$ = 112.15. Hexamethylenediamine. The heterocyclic compound,



A liquid, b.210. **t. glycol.** $C_6H_{14}O_4$ = 150.1. $(CH_2OH.CH_2.O.CH_2—)_2$. Colorless liquid, d.-1.1125, b.276, soluble in water or benzene; used as solvent for nitrocellulose and in synthesis.

triferrin. Iron paranucleinate. A reddish powder containing 22 % iron and 2.5 % phosphorus; insoluble in water, alcohol or ether. Used medicinally as a hematinic.

trifolium. Red clover blossoms. The dried flowers of *T. pratense*, a Leguminosae; used medicinally, as the fluid extract, as an alterative.

triformol. Paraformaldehyde.

trifructosan. $C_{18}H_{30}O_{15}$ = 486.24. Secalose, trifructose anhydride. A white, crystalline, sweet-tasting trisaccharide from rye-flour, and used to detect its presence in other flours; insoluble in 70 % alcohol, soluble in acids.

trigalloyl. Three galloyl radicals, $C_7H_5O_4$— or $C_6H_2(OH)_3CO$—, derived from gallic acid. **t. acetone glucose.** $C_{30}H_{28}O_{18}$ = 676.2. Amorphous, light brown mass, soluble in water. **t. glucose.** $C_{27}H_{24}O_{18}$ = 636.15. $(C_7H_5O_4)_3C_6H_9O_6$. Amorphous yellow mass, soluble in water. **t. glycerol.** $C_{24}H_{20}O_{15}$ = 548.12. $(C_7H_5O_4)_3.C_3H_5O_3$. Amorphous, brown mass, soluble in water, alcohol, ether or acetone. Used as a tanning agent.

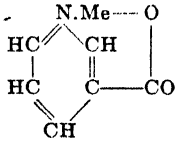
trigemin. $C_{18}H_{30}O_3N_3C_{15}$ = 424.6. Dimethylamidoantipyrinbutylchloralhydrate. Long, white needles, m.85; used as an analgesic and a sedative.

trigger. A substance which initiates a chain reaction, q.v.

triglyceride. See *glyceride*.

trigonal. Describing a crystal with two equal axes and one axis shorter or longer, all of them at right angles to one another. See *crystal systems*, *prisms*, *pyramids*.

trigonelline. $C_7H_7O_2N$ = 137.1. Nicotinic-methyl-betaine, the methylbetaine of nicotinic acid, in seeds of many plants; in sea urchin, *Arabacia pustulosa* and the Coelenterate, *Vella spirans*, jelly fish; and in urine, after taking nicotinic acid. Colorless crystals, m.218 (cf. *stachydrine*).



triguaiacyl. Having three guaiacyl radicals, $C_7H_7O_2$— or MeO.C_6H_4.O—. **t. phosphate.** $C_{21}H_{22}O_7P$ = 416.19. $(C_7H_7O_2)_3P.OH$. White crystals, m.98; used as a plasticizer. **t. phosphite.** $C_{21}H_{21}O_6P$ = 400.19. $(C_7H_7O_2)_3P$. White crystals, m.78; used as a plasticizer.

trihemellitic acid. Trimellitic acid.

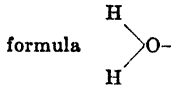
trihexosan. A dextrin, isolated from beer by precipitation with alcohol.

trihydrate. A compound that contains three molecules of water of crystallisation.

trihydric. Describing an alcohol with three hydroxy-groups.

trihydrocyanic acid. See *cyanidines*.

trihydrol. A threefold polymer of water, assumed to exist in solutions and to have the formula



. Cf. *dihydrol*.

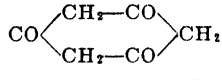
It is more abundant in cold than in hot water.

trihydroxy- A prefix indicating the presence of three hydroxy groups. **t. anthraquinone.** See *anthragallol*, *purpurin*, *anthrapurpurin*, *flavopurpurin*. **t. benzene.** **1.2.3-** Pyrogallol **1.-2.4-** $C_6H_3(OH)_3$ = 126.1. Hydroxy hydroquinone. White crystals m.141, very soluble in water, alcohol or ether. **1.3.5-** Phloroglucinol. **t. benzoic acid.** $C_7H_6O_5$ = 170.1. **2.3.4-** Pyrogallolcarboxylic acid, $C_6H_2(OH)_3COOH$. Colorless needles, d.$_4^{\circ}$1.69, m.110, decomp. 200, soluble in water, alcohol or ether. **3.4.5-** Gallic acid. **t. benzophenone.** $C_{13}H_{10}O_4$ = 230.2, m.133. **t. oestrin.** Oestriol. **t. pyridine.** $C_5H_5O_3N$ = 127.08. A solid, m.220–230 (decomp.), soluble in water, insoluble in alcohol or ether. **t. stearic acid.** $C_{17}H_{32}(OH)_3COOH$ = 332.0. A white solid, m.146, which acts as purgative.

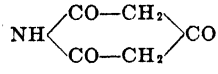
triiodide. A binary compound that contains three iodine atoms in its molecule.

triiodo-, triiod- A prefix indicating that a compound contains three iodine atoms in its molecule. **t. acetic acid.** $C_2HO_2I_3$ = 437.8. $CI_3.COOH$. Yellow scales, m.150; soluble in water. **t. benzene.** $C_6H_3I_3$ = 455.81. **1.2.3-** m.116 (sublime); **1.2.4-** m.91; **1.4.5-** m.183. **t. cresol** (*meta-*). Losophan. **t. methane.** Iodoform.

triketo- A prefix indicating that a compound contains three =CO groups in its molecule. **t. hexamethylene.** The keto-form of phloroglucinol,



t. hydrindenhydrate. Ninhydrin. **t. piperidine.** $C_5H_5O_3N$ = 127.1. 1.3.5-trioxypyridine. The heterocyclic compound,



t. purine. Uric acid.

triketones. A group of organic compounds containing three ketone groups, as,

Me.CO.CO.CO.Me..... pentanetrione
Me.CO.CH_2.CO.CO.Me..... 2.4.5-hexanetrione
Me.CO.CH_2.CO.CH_2.CO.Me. 2.4.6-heptanetrione

trilaurin. $C_{39}H_{74}O_6$ = 638.7. Glyceryl laurate, $C_3H_5(OOC.C_{11}H_{23})_3$. A crystalline glyceride from palmnut oil, cocoanut oil and bayberry oil.

trilinolein. $C_{57}H_{98}O_6$ = 878.8. Glyceryl linolate, $C_3H_5(OOC.C_{17}H_{30})_3$. A glyceride from linseed oil, sunflower oil or hempseed oil.

trilite. Trinitrotoluene.

trillion. (1) The number, 10^{18} (English and German usage = $1{,}000{,}000^3$). (2) The number 10^{12} (American and French usage) = $1{,}000{,}000 \times 1000^2$).

trillium. Beth-root, Indian balm, ground lily. The dried rhizome of *T. erectum*, a Liliacae; used medicinally, as the fluid extract, as a tonic and alterative.

trimellitic acid. $C_9H_6O_6$ = 210.1. Trihemellitic acid, 1.2.4-benzenetricarboxylic acid, $C_6H_3(COOH)_3$. Colorless crystals, m.216; soluble in water or alcohol.

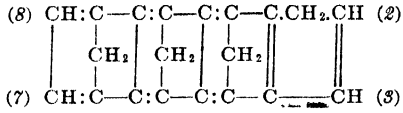
trimer. A condensation-product of three molecules. Cf. *polymer, dimer.*

trimeric. Able to form three-fold polymers. Cf. *trimetric.*

trimesic acid. Trimesitinic acid.

trimesitinic acid. $C_9H_6O_6$ = 210.1. Trimesic acid, 1.3.5-benzene tricarboxylic acid, $C_6H_3(COOH)_3$. Colorless crystals, m.348; soluble in water, alcohol or ether.

trimethano- A prefix indicating the presence of three $—CH_2—$ bridges in a ring; as, **t. cyclopentanthrene.**

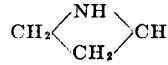


trimethoxy- A prefix indicating the presence of three methoxy groups, $CH_3O—$ or MeO—. **t. boron.** $C_3H_9O_3B$ = 103.69. Methylborate, $B(OMe)_3$. Colorless liquid, d.0.915, b.65.

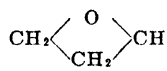
trimethyl- A prefix indicating that a compound contains three methyl groups in its molecule. **t. acetaldehyde.** Pival aldehyde. **t. acetic acid.** Pivalic acid. **t. acetone.** $C_6H_{12}O$ = 100.1. The ketone, $CMe_3.COMe$. **t. acetyl chloride.** Pivalyl chloride. **t. amine.** C_3H_9N = 59.1. Secaline. The tertiary amine, Me_3N, in leaves of *Chenopodium* species, in blood (0.002 %) and formed by the putrefaction of choline, etc. A colorless gas, d.0.673, m. −124, b.3.5; soluble in water, alcohol or ether. It is poisonous, and has a fishy ammoniacal odor; found in herring brine, and used for rheumatism. **t. amine oxide.** Me_3NO = 75.08. Kanirin. A base, m.96, occurring in muscle, urine, fishes, Cephalopods and Crustaceae. **t. amino hydrochloride.** $C_3H_9N.HCl$ = 95.6. Colorless crystals, m.271, soluble in water, alcohol or ether; used medicinally. **t. arsine.** C_3H_9As = 120.1. $AsMe_3$. A colorless liquid, d.1.124, b.52.8, soluble in water. **t. benzene. 1.2.3-** Hemimellitene. **1.2.4-** Pseudocumene. **1.3.5-** Mesitylene. **t. benzoic acid.** $C_{10}H_{12}O_2$ = 164.1. $C_6H_2Me_3COOH$. **2.3.5-** Colorless crystalline needles, m.149; soluble in alcohol or ether. **2.4.6-** Isodurylic acid. Colorless crystals, m.152; slightly soluble in water, soluble in alcohol or ether. **t. bismuthine.** C_3H_9Bi = 254.07. $BiMe_3$. A colorless liquid, d.2.300, b.110. **t. boron.** C_3H_9B = 55.89. BMe_3. White crystals, m.56, b.110. **t. carbinol.** $C_4H_{10}O$ = 74.1. The tertiary alcohol, CMe_3OH. A colorless crystalline mass or liquid, m.25, b.82; soluble in water, alcohol or ether. See *butanol.* **t. cyclohexane.** Hexahydrocumene. **t. cyclopentene.** Laurolene. **t. ethylene.** C_5H_{10} = 70.1. β-isoamylene, $MeCH:CMe_2$. A colorless liquid, b.36, insoluble in water, soluble in alcohol or ether; used medicinally as an anesthetic. **t. gallium.** C_3H_9Ga = 114.79. $GaMe_3$. A colorless liquid, m. −19, b.55.8. **t. glycine.** See *betaine.* **t. naphthalene.** Sapotalene. **t. phosphate.** $C_3H_9PO_4$ = 140.1. Me_3PO_4. A colorless liquid, d.1.220, b.197; soluble in alcohol or ether. **t. phosphine.** C_3H_9P = 76.1. Me_3P. A colorless liquid, b.40; insoluble in water, soluble in alcohol or ether. **t. pyridine.** Collidine. **t. quinoline.** $C_{12}H_{13}N$ = 171.17. The soluble solids: **2.3.4-** m.65, b.285; **2.5.7-** m.43, b.286; **2.3.6-** m.86, b.285; **2.6.8-** m.45, b.266. **t. tin.** $(C_3H_9Sn)_2$ = $(163.77)_2$. $SnMe_3$ or $Me_3Sn.SnMe_3$. A colorless liquid, d.1.570, m.23, b.182, insoluble in water. Cf. *stannane.* **t. tin bromide.** Me_3SnBr = 243.69. White crystals, m.27, b.165. **t. tin chloride.** Me_3SnCl = 199.23. White crystals, m.37. **t. tin hydride.** Me_3SnH = 164.78. An oily liquid, b.60. **t. tin hydroxide.** Me_3SnOH = 180.78. Colorless prisms, decomp. 118. **t. tin oxide.** $(Me_3Sn)_2O$ = 343.54. White amorphous powder. **t. tin sulfide.** $(Me_3Sn)_2S$ = 359.60. Yellow oil, d.1.649, m.6, b.233. **t. tryptophane.** Is Hypophorine. **t. xanthine.** Caffeine. **t. urea.** $C_4H_{10}ON_2$ = 102.1. $MeNH.CO.NMe_2$. Colorless crystals, m.75, b.232; soluble in water, alcohol or ether.

trimethylene. C_3H_6 = 42.1. (1) Cyclopropane, q.v. (2) A prefix indicating three methylene groups. (3) The bivalent radical, $—CH_2.CH_2.CH_2—$. **acetyl-** $C_3H_5.CO.Me$ = 84.1. A colorless liquid, b.113, insoluble in water, soluble in alcohol. **benzoyl-** Benzoyl cyclopropane. **keto-** Cyclobutanone. **methyl-** C_3H_5Me = 56.0. A colorless gas, b.4; insoluble in water, soluble in alcohol or ether.

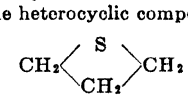
t. bromide. $C_3H_6Br_2$ = 201.90. The liquid $CH_2Br.CH_2.CH_2Br$, d.1.97, $b._{720mm}160$. **t. cyanide.** Glutaronitrile. **t. diamine.** 1.3-Propanediamine. **t. glycol.** 1.3-Propanediol. **t. group.** The bivalent radical $—CH_2.CH_2.CH_2—$. **t. imine.** C_3H_7N = 57.1. Tetrahydroform, 1.3-propylene imine. The heterocyclic compound,



t. oxide. C_3H_6O = 58.0. 1.3-propylene oxide. The heterocyclic compound,

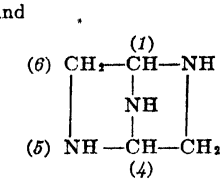


t. sulfide. C_3H_6S = 74.1. 1.3-propylene sulfide. The heterocyclic compound,



trimetric. Orthorhombic; cf. *trimeric.*

trimidine. $C_4H_9N_3$ = 99.09. The heterocyclic compound



trimolecular. Pertaining to three different molecules. **t. reaction.** A third order reaction, q.v.

trimorphism. The phenomenon of crystallizing in three different systems.

trimorphous. Describing a substance that crystallizes in three different systems.

trimyristine. Myristine.

trinitrate. A compound that contains three nitrate radicals, $(NO_3)_3$.

trinitride. Triazo.

trinitrin. Nitroglycerin.

trinitro- A prefix indicating that a compound contains three nitro-groups in its molecule. **t. aniline.** Picramide. **t. anisole.** $C_7H_5N_3O_7$ = 243.06. $MeO.C_6H_2(NO_2)_3$. White crystals, **2.3.4-** m.155. **2.3.5-** d.1.618, m.104. **2.4.6-** d.1.408, m.68.4. **3.4.5-** m.120. **3.4.6-** m.107. Used as high explosives. **t. benzene.** $C_6H_3(NO_2)_3$ = 213.1. T.N.B. **1.2.4-** Yellow crystals, m.57; slightly soluble in water; used in organic synthesis. **1.3.5-** sym., Yellow crystals, d.1.688, m.122, decomp. by further heat; slightly soluble in water, soluble in alcohol or ether. **t. cellulose.** Pyroxylin. **t. cresol.** $C_7H_5O(NO_2)_3$ = 243.1. 1-Methyl-3-hydroxy-2.4.6-trinitrobenzene, $C_6HMe(OH)(NO_2)_3$. Yellow needles, m.105, soluble in water, alcohol or ether; used as an antiseptic and in explosives. **t. glycerin.** Nitroglycerin. **t. naphthalene.** $C_{10}H_5(NO_2)_3$ = 263.1. **1.4.5-** or γ- Yellow needles, m.147; soluble in alcohol. **1.3.8-** or β- Yellow monoclinic needles, m.215; soluble in alcohol, ether or chloroform. **1.3.5-** or α- Yellow monocline crystals, m.122; slightly soluble in water, soluble in alcohol or ether. **1.2.5-** or γ- m.113. Used in organic synthesis and as explosives. **t. orcinol.** $C_7H_5O_8N_3$ = 259.10. $C_6(NO_2)_3Me(OH)_2$. A solid, m.163.5, slightly soluble in water, soluble in ether or benzene. **t. phenol.** $C_6H_3N_3O_7$ = 229.05. $HO.C_6H_2(NO_2)_3$. α- or **2.4.6-** Picric acid. β- or **2.4.5-** m.96. γ- or **2.3.6-** m.117.5. δ- or **2.3.5-** m.120. All are yellow crystals, soluble in water, and used as explosives. **t. phenyl methyl-tetramine.** Tetryl. **t. resorcinol.** $C_6H(NO_2)_3(OH)_2$ = 245.08. A solid, m.176 (sublimes). Soluble in alcohol or ether, slightly soluble in water. **t. toluene.** $C_7H_5O_6N_3$ = 227.1. **2.4.6-** or α- Trotyl, tolit, trilite, trinol, T.N.T., 1-methyl-2.4.6-trinitrobenzene, $C_6H_2Me(NO_2)_3$; pale yellow monoclinic leaflets, d.1.654, m.80.6, slightly soluble in water, alcohol or ether. Used similarly to picric acid in explosives. **2.3.4-** or β- Colorless leaflets, d.1.62, m.112; insoluble in water, slightly soluble in alcohol, soluble in ether. **3.4.5-** or δ- m.137.5. **2.3.5-** or ε- m.97.2. **2.3.6-** or ζ- m.79.5. **2.4.5-** or γ- Colorless crystals, d.1.62, m.104; insoluble in water, soluble in ether. Used as high explosives. **t. triazidobenzene.** $C_6N_{12}O_6$ = 336.0. Turek detonator, $(NO_2)_3C(N_3)_3$. Greenish-yellow crystals, m.131 forming hexanitrobenzene, insoluble in water; used as a detonating high explosive. **t. xylene.** $C_6H(NO_2)_3Me_2$ = 241.13. T.N.X. **2.4.6.1.3-** m.182; **2.3.5.1.4-** m.140.

trinitrol. Erythrol tetranitrate.

trinol. Trinitrotoluene.

-triol. A suffix indicating 3 hydroxy-groups present; as, propanetriol, $C_3H_5(OH)_3$, glycerol.

triolein. Olein.

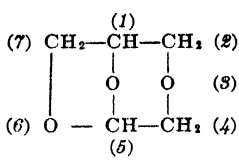
trional. $C_8H_{18}O_4S_2$ = 242.3. Sulfonethylene methane, $EtC(SO_2Et)_2Me$. A colorless crystalline powder, m.76; slightly soluble in water; used medicinally as a hypnotic.

-trione. A suffix indicating the presence of 3 keto groups, =CO.

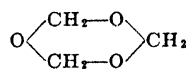
triose. $C_3H_6O_3$ = 90.1. A group of monosaccharides derived from glycerol:

CHO.CHOH.CH_2OH and CH_2OH.CO.CH_2OH.

trioxa- A prefix indicating three oxygen bridges in a ring system; as, **t. bicyclo octane.** $C_5H_8O_3$ = 116.1.

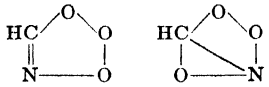


trioxan(e). $C_3H_6O_3$ = 90.1. Paraformaldehyde. The heterocyclic compound,



White crystals, m. 63, used in organic synthesis.

trioxazole. CHO_3N = 75.0. The heterocyclic compounds,



1.2.3.4- **1.2.4.3-**

trioxide. Teroxide. A binary compound that contains three oxygen atoms in its molecule. *E.g.*, Fe_2O_3, iron trioxide; SO_3, sulfur trioxide.

trioxin. Paraformaldehyde.

trioxime. A compound containing three =NOH radicals.

trioximido- A prefix indicating that the compound contains three —CH:N.OH groups in its molecule. **t. propane.** $C_3H_6O_3N_3$ = 132.08. HON:CH—C(:NOH)—CH:NOH. Colorless crystals, m.171.

trioxy- (1) A prefix indicating the presence of three oxygen atoms in the compound; generally as —C:O groups. (2) Trihydroxy. **t. methylene.** Paraformaldehyde. **t. purine.** Uric acid.

tripalmitin. Palmitin.

tripan roth. Trypan red.

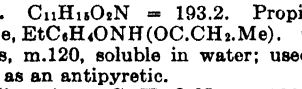
tripestone. A concretionary form of anhydrite.

triphane. Spodumene.

triphasic. Describing a system involving three phases.

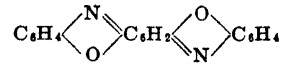
triphen- A prefix indicating that the compound contains three benzene-rings in its molecule.

triphenazineoxazine. $C_{18}H_{11}ON_3$ = 285.2. The heterocyclic compound,



triphenin. $C_{11}H_{15}O_2N$ = 193.2. Propionylphenetidine, $EtC_6H_4ONH(OC.CH_2.Me)$. Colorless crystals, m.120, soluble in water; used medicinally as an antipyretic.

triphenodioxazine. $C_{18}H_{10}O_2N_2$ = 286.2. The heterocyclic compound,

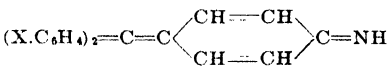


triphenol. Triatomic phenol. A compound having three —OH groups in an unsaturated ring.

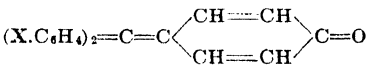
triphenyl- A prefix indicating that the compound contains three phenyl radicals in its molecule. **t. acetic acid.** $C_{20}H_{16}O_2$ = 288.23. The monobasic acid, $CPh_3.COOH$. Colorless monoclinic crystals, m.264 (decomp.); slightly soluble in water, soluble in alcohol. **t. amine.** $C_{18}H_{15}N$ = 245.22. The tertiary amine, Ph_3N. Color-

less monoclinic prisms, m.127, b.347; slightly soluble in alcohol, soluble in benzene or ether. **t. benzene.** $C_{24}H_{18}$ = 306.26. The aromatic hydrocarbon, $C_6H_3Ph_3$ (1.3.5-). Colorless. rhombic crystals, d.1.206, m.169; b. above 300; insoluble in water, slightly soluble in alcohol or ether. **t. bismuthine.** $C_{18}H_{15}Bi$ = 440.12. Bismuth triphenyl, $BiPh_3$. White monoclinic crystals, d.1.585, m.78, very soluble in chloroform. **t. carbinol.** $C_{19}H_{16}O$ = 260.22. The tertiary alcohol, $Ph_3C.OH$. Colorless hexagonal prisms, m.159, b. above 360, insoluble in water, soluble in alcohol, ether or benzene; used in organic synthesis, and in the manufacture of triphenylmethane dyes. *amino-* $C_{19}H_{15}O(NH_2)$ = 275.2. $NH_2C_6H_4.CPh_2OH$. meta-, m.155, para m.116. *diamino-* $C_{19}H_{14}O(NH_2)_2$ = 290.2. $(NH_2C_6H_4)_2CPhOH$. **t. ethane.** $C_{20}H_{18}$ = 258.15. $Ph_2CH.CH_2Ph$. Colorless. crystals, m.54, b.349.4. **t. ethylene.** $C_{20}H_{16}$ = 256.4. *α*-phenylstilbene. The hydrocarbon $Ph_2C:CHPh$. **t. guanidine.** $C_{19}H_{17}N_3$ = 287.17. $PhN:C:(NHPh)_2$. *alpha-* A solid, m.143, decomp. by further heat, soluble in alcohol. *beta-* A solid, m.131, soluble in water, alcohol, or ether. **t. methane.** $C_{19}H_{16}$ = 244.2. The hydrocarbon, Ph_3CH. Colorless leaflets, d.1.057, m.92, b.258, insoluble in water, soluble in alcohol, ether, benzene or chloroform. Used in organic synthesis, and in the manufacture of dyes. **t. methane dyes.** A group of dyes derived from triphenylcarbinol by the introduction of auxochromic groups. Classification:

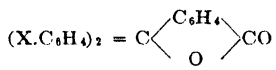
(1) fuchsin group



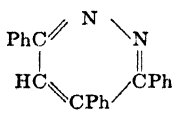
(2) aurin group



(3) phthalein group



t. methyl. $C_{19}H_{15}$ = 243.2. A "free radical" compound, Ph_3C; colorless crystals, m.300, b.420 (cf. *hexaphenylethane*, *tridiphenylmethyl*). **t. phosphine.** $C_{18}H_{15}P$ = 262.3. Ph_3P. Colorless monoclinic crystals, m.15; insoluble in water, soluble in alcohol or ether. **t. pyridazine.** $C_{22}H_{16}N_2$ = 308.15.

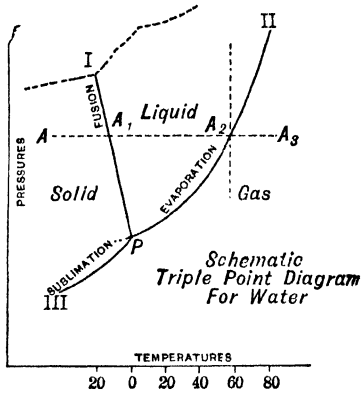


Colorless crystals, m.171. **t. stibine.** $C_{18}H_{15}Sb$ = 352.9. Ph_3Sb. **t. tin.** $C_{18}H_{15}Sn$ = 349.82. Tin triphenyl, $SnPh_3$. White powder, m.232, decomp. 280. **t. tin chloride.** Ph_3SnCl = 385.27. White crystals, m.106, $b._{13mm}240$, insoluble in water; used as reagent for fluorides.

triphenylene. $C_{18}H_{12}$ = 228.1. The tetracyclic hydrocarbon, $C_6H_4{<}^{C_6H_4}_{C_6H_4}{>}C_6H_4$.

triphylite. $LiFePO_4$. A native lithium iron phosphate; greenish-blue rhombic crystals.

triple. Threefold. **t. bond.** The acetylene linkage, —C:C—, which is readily saturated. It is indicated by the suffix -yne*, replacing the former -ine; as, propyne* (propine). **t. chlorides.** A group of complex chlorides of the type $M'_4M''M'''_2Cl_{12}$ in which M' is Na, K, Cs, or NH_4; M'' is either Zn, Cu, Hg, Ag_2, or Au_2; and M''' is trivalent Au. **t. nitrite reagent.** A solution of 120 gm. sodium nitrite, 9.1 gm. copper acetate, 16.2 gm. lead acetate, 2 cc. acetic acid in 50 cc. water. It gives crystals of characteristic shape with potassium salts. **t. phosphate.** (1) A magnesium, calcium, ammonium phosphate, sometimes found in urine. (2) Treble superphosphate. A phosphate rock containing 3 times as much phosphoric acid as superphosphate. **t. point.** The conditions (expressed in terms of vapor-pressure curves)

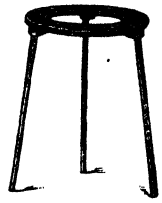


under which three phases can exist in equilibrium; *e.g.*, in the system ice-water-water vapor, at the pressure of 4.57 mm. and temperature of 0.008°C. See figure, and *phase rule, diagram, quadruple.* **t. salts.** A group of compounds whose molecules consist of three cations and one anion; as, $Na_2CaCu(NO_2)_6$.

triplet. See *multiplet.*

triplite. $(Fe,Mn)_2FPO_4$. A greasy mineral.

tripod. A three-legged support for holding flasks or other containers over a bunsen burner.



Tripod.

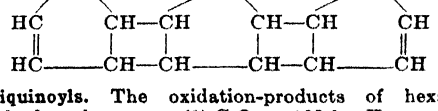
tripoli. Rottenstone. Decomposed limestone used for polishing. **t. powder.** Kieselguhr.

tripolite. A variety of native silica secreted by diatoms. Cf. *kieselguhr.*

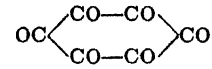
trippkëite. A native copper arsenate.

tripropyl. A prefix indicating the presence of three propyl radicals. **t. amine.** $C_9H_{21}N$ = 143.2. The tertiary amine $(C_3H_7)_3N$. A colorless liquid, m.15; slightly soluble in water, readily soluble in alcohol or ether.

tripyrrole. $C_{12}H_{15}N_3$ = 201.15. The heterocyclic compound



triquinoyls. The oxidation-products of hexahydroxybenzene. (1) C_6O_6 = 168.0. Hexaoxybenzene.



(2) $C_6H_{16}O_{14}$ = 312.16. A solid, decomp. 95, slightly soluble in water, insoluble in alcohol or ether.

triricinolein. Ricinolein.

trisaccharide. A carbohydrate that contains three monosaccharides in its molecule, and hydrolyzes to three simple sugars, *e.g.*, $C_{18}H_{32}O_{16}$, or $(C_6H_{10}O_5)_3.H_2O$, raffinose.

trisalyt. A mixture of cyanides (NaCN, $Zn(CN)_2$) and $NaHSO_3$ used in electroplating.

trisazo- A prefix indicating the presence of three azo-groups, —N:N—, in the molecule of a compound.

trisilane. Si_3H_8 = 92.2. A colorless liquid, m.−117, b.53; unstable at ordinary temperatures.

trisilicic acid. $H_4Si_3O_8$ = 216.3. A white insoluble powder.

tristearin. Stearin.

trisulfide. A binary compound that contains three sulfur atoms in its molecule. *E.g.*, Fe_2S_3, iron trisulfide; Na_2S_3, sodium trisulfide.

tritartaric acid. Uvic acid.

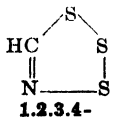
triterium. Tritium.

trithiane. $C_3H_6S_3$ = 138.05.

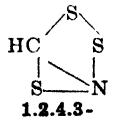
S.CH_2.S.CH_2.CH_2, *s-* or *1.3.5-*.

trithioacetaldehyde. Sulfo-paraldehyde.

trithioazol. $CHNS_3$ = 123.2. The heterocyclic compounds,



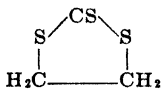
1.2.3.4-



1.2.4.3-

trithiocarbonic acid. See *thiocarbonic acids.*

trithiocarbonicethidene ester. $C_3H_4OS_3$ = 152.2. The heterocyclic compound,



trithiolane. $C_2H_4S_3$ = 124.05.

S.S.CH_2.S.CH_2, *1.2.4-* or

S.S.S.CH_2.CH_2, *1.2.3-*.

trithionic acid. The sulfur acid, (q.v.) $H_2S_3O_6$.

triticum. (1) A genus of grasses which includes wheat. (2) Couch grass, dog grass. The dried rhizomes of *T.* or *Agropyron repens*, a Gramineae. It contains carbohydrates and malates; used medicinally as a diuretic.

tritium. T or H^c = 3.00. Triterium. An isotope of hydrogen (q.v.) having a mass of 3 and obtained with deuterium (q.v.) by the electrolysis of water.

triton-B. Tetramethyl ammonium hydroxide. **t.-F.** Dimethyl dibenzyl ammonium hydroxide. Used as solvents for cellulose, for saponifying fats, and in inorganic synthesis.

tritopine. $C_{42}H_{54}O_7N_2$ = 698.4. An alkaloid from opium; colorless scales, m.182.

triturate. To grind or rub to a powder (usually with a liquid) in a mortar.

trituration. Any finely-powdered drug, or a mixture of milk-sugar and a drug.

trityl. The radical triphenylmethyl, Ph_3C—.

triuret. $C_3H_6N_4O_3$ = 146.06. Carbonylurea. $(NH_2CONH)_2CO$. Cf. *biuret.*

trivalent. Tervalent. Describing an atom or radical that has a valency of three.

trivalerin. Phocenin.

troche. A tablet or medicated disk.

troctolite. A granitoid, crystalline, plutonic rock containing olivine and felspar.

trogerite. A native hydrous uranium arsenate.

troilite. A native form of FeS.

trommel. A cylinder of perforated steel plate revolving around an inclined central axis; used for large-scale sifting purposes.

Trommer's test. A test for glucose in urine. On warming the sample with sodium hydroxide and copper sulfate, a yellowish-red precipitate indicates sugar.

Trommsdorff, Johann Bartholomäus. 1770–1837. A German apothecary noted for chemical analysis, teachings and writings; founder of *Journal der Pharmazie.*

tron(a). $Na_2CO_3.NaHCO_3.2H_2O$. A native sodium carbonate and sodium bicarbonate. Cf. *natron, urao.* **t. potash.** Kemfert. A high grade KCl from Searles Lake, California, 58–62 % K_2O; used for fertilizers.

troostite. (1) A native zinc-magnesium silicate. (2) A transition form of cementite, austenite and ferrite; it is an emulsified ferrite. Cf. *steel.*

tropacocaine. $C_{15}H_{19}O_2N$ = 245.17. Benzoylpseudotropine, $C_5H_9N.CH_2.CH.O.COPh$. An alkaloid obtained from coca leaves. Colorless glistening crystals, m.49, slightly soluble in water, soluble in alcohol or ether; used medicinally as a local anesthetic. **t. hydrochloride.** $C_{15}H_{19}O_2N.HCl$ = 281.62. Colorless crystals, m.271, soluble in water; used as a local anesthetic.

tropæolin. Tropeolin.

tropaic acid. Tropic acid.

tropan. $C_8H_{15}N$ = 125.1. *N*-methyl nortropan. The hydrocarbon of tropine, q.v.

tropate. Any salt of tropic acid.

tropeine. Any ester of tropine and an organic acid, as atropine or hyoscyamine.

tropeolin. Tropaeolin. A group of hydroxy-azo dyes of the type, R—N_2—$C_6H_4.SO_3Na$, the sodium salts of R-azobenzenesulfonic acids; as:

tropeolin D, or methyl orange, p-dimethylaminoazobenzenesulfonic acid, where R is $Me_2NC_6H_4$—

tropeolin O, yellow T, or resorcinol yellow, resorcinolazobenzenesulfonic acid, where R is $(HO)_2C_6H_3$—. Used as pH indicator, changing at 12.0 from yellow (acid) to brown (alkaline).

tropeolin OO, diphenylamine orange, orange IV or phenylamineazobenzenesulfonic acid, where R is $PhNH.C_6H_4$—. Used as a pH indicator, changing from red (1.3) to yellow (3.2).

tropeolin OOO 1, alpha-naphtholorange, orange I, where R is $HO.C_{10}H_6$—

tropeolin OOO 2, beta-naphtholorange, orange II, where R is $HO.C_{10}H_6$—

Some of these dyes are used as indicators, and in dyeing woolen and silken fabrics.

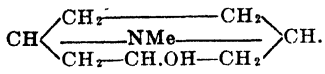
tropic acid. $C_9H_{10}O_3$ = 166.1. Phenylhydracrylic acid, tropaic acid. An optically-active aromatic hydroxyacid, $CH_2OH.CHPh.COOH$, obtained by hydrolysis of atropine. i- Colorless crystals, m.117, decomp. by further heat: soluble in water. d- m.127. l- m.123.

tropidine. $C_8H_{13}N$ = 123.1. *N*-methylnortropidine. An oily liquid obtained by dehydration of tropine, d.0.95, b.162; insoluble in water, soluble in alcohol or ether. Cf. *nortropidine.*

tropilidene. C_7H_8 = 92.1. *1.3.5*-Cycloheptatriene. An oily liquid, d.0.903, b.117, prepared by distilling tropine with soda-lime.

tropin. See *sensitizer* (2).

tropine. $C_8H_{15}ON$ = 141.2. Tropanol-3, 3-hydroxytropan. A heterocyclic alcohol, occurring as ester in atropine and hyoscyamine:



Colorless needles, m.62, b.220; soluble in water, alcohol, or ether. **iso-** See *atropine.* **pseudo-** *ψ*-tropine. An optically-inactive isomer obtained by heating t. with phenyl amylate. It is a hydrolytic split-product of Java coca plants. Colorless needles, m.108, b.$_{755mm}$237; soluble in water or alcohol. **t. alkaloids.** See *atropine, cocaine, ecgonine.* **t. carboxylic acid.** Ecgonine. **t. sulfate.** $(C_8H_{15}ON)_2H_2SO_4$ = 380.6. A white crystalline powder, soluble in water or alcohol.

tropopause. The altitude at which the temperature of the atmosphere ceases to decrease with increase in height.

trotyl. Trinitrotoluene.

Trouton, Frederick Thomas. An English physicist. **T.'s rule.** The molal latent heat or heat of evaporation, ΔH_m, is equal to about twenty times the boiling point, T_b (absolute); $\Delta H_m/T_b$ = 20.22. Exceptions exist; as, water or alcohol. Cf. *Hildebrand's rule, Diterici's rule.* It can also be expressed by $T_{760mm} = T_p(1.648 - 0.255 \log p)$, where T_{760mm} is the boiling point (at 760 mm.), and p the pressure.

troy. A system of weights and measures used by jewelers. 1 oz. troy = $\frac{1}{12}$ pound = 480 grains = 20 pennyweights = 1.09714 oz. avoir. = 1 oz. apoth. = 31.1035 grams. 1 pound troy = 5760 grains = 240 pennyweights = 13.1667 oz. avoir. = 0.82286 pds. av. = 373.2509 grams. **t. weights.** The weight system used in reports on gold, silver, or precious metals:

1 oz. troy = $20.67 = 85 shillings gold value
1 pd. troy = $248.04 = 51 pounds sterling

Trubenizing. A process for permanently stiffening fabrics and making them unshrinkable, by inserting a cellulose acetate thread between the cotton or linen and calendering with a cellulose acetate solvent.

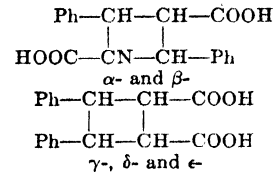
trust. An absolute or near control of the source, manufacture or sale of a commodity within a political area; as (in 1939):

	A, Per cent	B, Per cent	C, Per cent
I. G. Farbenind. (*Germany*)	100	90	85
Imp. Chem. Ind. (*England*)	40	95	100
Kuhlman, etc. (*France*)	80	70	40
Union Chimique (*Belgium*)	...	100	

A = Dyes. B = Acids and heavy chemicals. C = Synthetic nitrogen. Cf. *monopoly.*

truxelline. An alkaloid obtained from coca leaves. It consists of an ester of ecgonine and truxillic acids.

truxillic acid. $C_{18}H_{16}O_4$ = 296.1. A dimer of cinnamic acid obtained from coca leaves. There are five stereoisomeric compounds; the *γ*- and *δ*-isomer is *truxillic acid.* Cf. *norpinic acid.*



truxinic acid. $C_{18}H_{16}O_4$ = 296.1. An isomer of truxillic acid, q.v.

trypaflavin(e). Diamino methyl acridinium chloride. A yellow dye which darkens on exposure; used in a 0.1 % solution as a bactericide. Cf. *acriflavine.*

trypan blue. Diamine blue, congo blue, azidin blue, Niagara blue, sodium tolidin-disazo-bi-1-amino-8-naphthol-3.6-disulfonic acid.

$[(NaSO_3)_2C_{10}H_3(NH_2)OH.N:N.C_6H_3Me—]_2$

A bluish-gray powder. Used as a dye, and medicinally, as an antiprotozoan agent in malaria and trypanosomiasis.

trypan-red. Tripanroth. A brown powder; used as a dye and medicinally, as an antiprotozoan agent.

tryparsamide. $C_8H_{10}AsN_2O_4Na$ = 287.0. Sodium *N*-phenylcinnamide-*o*-arsonate.

$NH_2.CO.CH_2.NH.C_6H_4.AsO(OH)ONa.$

A white powder, used to treat sleeping sickness and neurosyphilis. Cf. *carbarsone, acetarsone.*

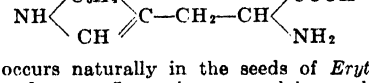
trypsase. Trypsin.

trypsin. Trypsase. Alkali proteinase. An enzyme of pancreatic juice that hydrolyzes proteins to proteoses, and proteoses to true peptones (tryptones) and finally to leucine and tyrosine. A yellowish powder, soluble in water; it is most efficient in a slightly alkaline solution.

tryptic activity. The hydrolytic or digestive power of trypsin.

tryptone. The true peptones produced by trypsin, as distinct from pepsin peptones.

tryptophane. $C_{11}H_{12}O_2N_2$ = 204.2. Indylalanine, *α*-amino-*β*-indyl propionic acid, indolealanine. An aromatic amino acid and split-product of proteins.



It occurs naturally in the seeds of *Erythrina hypaphorus*, a Leguminosae, and is a colorless solid, m.289, soluble in water, insoluble in alcohol or ether. **trimethyl-** Hypophorine.

tryptophyl. The monovalent radical, $C_{11}H_{11}ON_2$—, derived from tryptophane.

T.S. An abbreviation for test-solution.

tschermigite. A native ammonium alum.

Tschugajew's reaction. A test for nickel. The formation of a scarlet-red precipitate on the addition of dimethylglyoxime to a weak ammoniacal, nickel-salt solution.

tsugaresinol. $C_{20}H_{20}O_6$ = 356.2. Sulfite liquor lactone, *l*-conidendrin. A lignin lactone in sul-

fite waste liquor, and in Japanese hemlock (*Tsuga sieboldii*). White crystals, m.250 (approx.)

T-stoff. See *xylyl bromides.*

T.T. Tuberculin-tested; as applied to milk from tuberculin-tested cows.

Tu. The symbol for thulium, element At. No. 69.

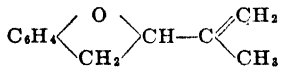
tuba root. Derris root.

tubacurarine. $C_{19}H_{28}N_2O$ = 298.21. An amorphous brown alkaloid from curare.

tubaic acid. $C_{12}H_{12}O_4$ = 220.09. A constituent of derris root; q.v. **iso-** See *rotenic acid.*

tubain. A resin from *derris root*, q.v.

tubanol. $C_{11}H_{12}O$ = 160.0. A split-product of rotenone.



hydroxy-carboxy- Tubaic acid. **tetrahydro-2-**Isoamylresorcinol.

tubatoxin. Rotenone.

tub-sizing. An operation in paper-making in which high-class writing papers are passed through a bath of gelatin and slowly dried in air, in order to increase the strength and improve the writing surface.

tube. Any long and hollow device. **absorption-** See *absorption tube, a. cell.* **agglutination-** A small test-tube. **Arndt-** q.v. **arsenic-** A long glass-tube with drawn-out tip or jet bent at an angle of 120°. Cf. *Marsh test.* **Babcock-** See *Babcock bottle.* **barometer-** A narrow tube closed at one end and more than 32 inches long. **Brown-** A potash bulb. **calcium chloride-** A glass-tube of varied shape, filled with $CaCl_2$; used to dry gases. **capillary-** A glass tube with a fine bore (1 mm. or less). **cathode-** q.v. **centrifuge-** A thick-walled glass-container of varied shape, for use in a centrifuge. **colorimeter-** A flat-bottomed test tube of clear white glass, for use in colorimeters. **combustion-** A glass tube, resistant to heat. **comparison-** A colorimeter t. **condenser-** The inner tube of a condenser. **Coolidge-** An x-ray tube with electrically-heated cathode. **Crookes-** A vacuum tube exhausted to such an extent that x-rays are produced on the passage of an electric current. **culture-** A test-tube for growing bacteria. **Dorn-Goetz-** A vacuum tube for spectroscopic work. **drying-** A glass-tube, variously shaped, filled with a drying agent. **Emmerling-** An absorption t. **extraction-** See *Soxhlet apparatus.* **fermentation-** Saccharometer. An inverted test-t. for collecting gases. **filter-** A glass-tube for connecting Gooch crucibles to a source of suction. **funnel-** A long glass-tube with conical top. **Geissler-** A tube that contains traces of gas at low pressure; used to produce the characteristic spectrum of the gas by the passage of an electric current. **Giltner-** A t. for anaerobic cultures. **guard-** (1) A metal casing to protect glass ware from mechanical injury. (2) See *guard.* **Hinman-** A t. for determining ammonia. **Hittorf-** A modified Crookes t. **Hortvet-** A centrifuge t. **La Bel-** A t. for fractional distillation. **melting point-** A thin-walled capillary tube. **Nessler-** Colorimeter t. **Peligot-** Calcium chloride t. **Pitot-** A manometer to record pressure. **Plucker-** A vacuum t. for spectroscopic work. **T-** A T-shaped glass-tube used in making three-way connections. **test-** A glass-tube, closed at one end and made of heat- and acid-resistant glass. **thistle-** A funnel-tube with bulb-shaped end, called a thistle top. **U-** A U-shaped glass-tube. **vacuum-** A glass vessel that has been highly evacuated; as, a Crookes or Geissler tube. **X-** A cross-shaped tube for making four-way connections. **x-ray-** See *x-ray tube.* **Y-** A Y-shaped glass-tube used for making three-way connections.

tuberculin. A therapeutic preparation obtained by the extraction of tubercle bacillus with various solvents, usually by long grinding in a bacteria mill.

tuberculostearic acid. $C_{19}H_{38}O_2$ = 298.2. *10-*Methylstearic acid. A fatty acid from bovine tubercle bacilli. Cf. *phthioic acid.*

tuberin. A globulin from potato juice, representing about 50 % of the total protein present.

tubers. The underground stems of plants that serve as storage receptacles for reserve materials. Two tubers are official and used medicinally, aconite and jalap.

tubing. Glass or rubber tubes used in the construction and connection of chemical apparatus. **alundum-** A hollow alundum rod. **glass-** A hollow glass-rod. **pressure-** A heavy-walled rubber hose for connecting pressure or vacuum lines. **rubber-** A round, flexible and hollow tube used to connect devices for the passage of liquid or gaseous materials. **silica-** A transparent or opaque, hollow rod of silica, used for the combustion of substances at high temperatures.

tubule. A small tube or neck on a glass apparatus.

tufa. A calcareous sinter or sedimentary rock composed of calcium carbonate and silica; formed by chemical reaction from lake or ground water; as, travertine. Cf. *tuff.*

tuff. A sedimentary rock composed of volcanic dust, ash and cinders, (cf. *tufa*).

tulipiferine. An alkaloid obtained from the bark of *Liriodendron tulipifera*, a Magnoliaceae.

tulip tree. The tree *Liriodendron tulipifera*, a Magnoliaceae of North America.

tumbago. An alloy of 33 % gold, 12 % silver and 55 % copper of ancient origin, found in Columbia.

tung oil. Chinese wood oil. A rapidly-drying oil extracted from the nuts of *Aleurites cordata* and *A. fordii*, an euphorbiaceous tree of China, and Japan, and now cultivated in Florida. A yellow jellifying liquid, d.0.936–0.942, used for paints, varnishes, enamels and linoleum. It replaces linseed oil and gives a higher gloss and a more water-resistant finish. Cf. *lumbang oil, bancoul nuts.* **t. pomace.** Tung oil cake. The ground and dried remains of the seeds after the oil has been extracted. It contains 5–6 % N, 2 % P and 1.3 % K_2O; used as fertilizer.

tungstate. Wolframate. A salt of tungstic acid of the general type, M_2WO_4. **meta-** A salt of metatungstic acid of the general type, $M_2W_4O_{13}$; as, sodium metatungstate, $Na_2W_4O_{13}$. **para-** A salt of paratungstic acid of the general type, $M_{10}W_{12}O_{41}$.

tungsten. W = 183.92. Wolfram, wolframium. A heavy metal and element, atomic number 74. A gray to black, hard, brittle powder, d.19.10, m.2974, b.6700; insoluble in water, soluble in nitric acid and hot hydroxide solutions. Its valencies are 2, 4, 5 and 6. It occurs in nature in wolframite, scheelite, and tungstite, and is used (as ferrotungsten) in the manufacture of steel for high-speed tools and of metallic filaments (m.3100°C.) for electric light bulbs. **ferro-** An alloy obtained in the electric furnace;

used for high-speed tools; W (7–9 %) Cr (2–3 %), and Fe. **orange-** $Na_2WO_4.W_2O_5$. Saffron bronze, tungsten-sodium tungstate. Gold colored scales, insoluble in ordinary solvents; used as a pigment. **violet-** $K_2W_3O_9.W_2O_5$. Potassium tritungstate, a bluish-black powder, used as a pigment.

t. alloy. See *ferrotungsten, steel, partinium.*

t. bronze. An alkali-metal salt of polymerized tungstic acid; as orange t. and violet t., q.v.

t. carbides: (1) WC. d.15.7, m.2780. (2) W_2C. d.16.06, m.2880. (3) W_3C. m. above 2700. *cemented-* An extremely hard alloy of WC embedded in tungsten and 5–15 % Co; d.14–15; hardness, second to diamond. Used for high-speed machine tools. Cf. *carboloy, widia.*

t. chlorides: T. dichloride, WCl_2; t. tetrachloride, WCl_4; t. pentachloride, WCl_5; t. hexachloride, WCl_6.

t. dichloride. WCl_2 = 254.9. An amorphous gray powder, decomp. by water.

t. dioxide. WO_2 = 216.0. A brown, rhombic, crystalline powder, d.12.11; insoluble in water, soluble in acids or alkalis.

t. disulfide. WS_2 = 248.1. A dark gray crystalline powder, d.7.5.

t. fluoride. WF_6 = 298.0. A gas.

t. hexachloride. WCl_6 = 396.8. Dark blue, cubic crystals, d.13.3, m.275, b.346; slightly soluble in water, soluble in carbon disulfide.

t. minerals. The most common ores are the tungstates and sulfide:

tungstenite	WS_2
stolzite	$PbWO_4$
ferberite	$FeWO_4$
wolframite	$(Fe,Mn)WO_4$
hülsnerite	$MnWO_4$
scheelite	$CaWO_4$
cuprotungstite	$CuWO_4$

t. oxides: T. dioxide, WO_2; t. pentaoxide, W_2O_5; t. trioxide, WO_3.

t. oxychloride. $WOCl_4$ = 341.63. Tungstyl chloride. A dark red crystalline mass, m.209, b.227, rapidly decomp. by water; it absorbs moisture from the air.

t. pentachloride. WCl_5 = 361.3. Black needles, d.3.52, m.248, b.275, decomp. in water, slightly soluble in carbon disulfide.

t. pentoxide. W_2O_5 = 448.0. Blue tungstic oxide. A blue powder; insoluble in aqua regia.

t. tetrachloride. WCl_4 = 325.8. A gray crystalline powder, decomp. by water or heat.

t. trioxide. WO_3 = 232.0. Tungstic acid anhydride. A yellow, rhombic, crystalline powder, d.7.16, m. at red heat; insoluble in water or acids, soluble in strong alkalis. Used in the manufacture of metallic tungsten for lamp filaments.

t. trisulfide. WS_3 = 280.2. A black powder, slightly soluble in water, soluble in alkalis or sulfide solutions.

tungstic. Pertaining to pentavalent or hexavalent tungsten.

t. acid. H_2WO_4 = 250.02. A yellow crystalline powder; insoluble in water, soluble in hydrofluoric acid or alkalis. It forms a hydrate H_2WO_4,H_2O.

t. acids. A group of acids derived from hexavalent tungsten by polymerization of tungstic acid:

tungstic acid.... $(WO_3 + H_2O)$, or H_2WO_4.
*meta*tungstic acid $(4WO_3 + H_2O)$, or $H_2W_4O_{13}$.
*para*tungstic acid $(12WO_3 + 5H_2O)$, or $H_{10}W_{12}O_{14}$.

t. ocher. Tungstite.

tungstite. Tungstic ocher. Wolframine. Native WO_3.

tungstosilicic acid. $H_8SiW_{12}O_{42}$. A compound isomeric with silicotungstic acid, which forms hydrates with water.

tungstyl. The tetravalent radical, $\gg WO$.

tuning fork. A forked-shaped metal instrument with two prolonged arms which may be set in rapid and sustained vibrations at an almost constant frequency, by means of a sharp blow. Electrically-sustained tuning-forks are used for synchronizing vibrations.

tuno gum. Chicle.

tupelo. A forest tree of North America, *Nyssa aquatica*, or cotton gum tree, a Cornaceae of the Mississippi valley. Used as a commercial timber; the spongy wood of the roots is used medicinally for sponge tents.

turacin. A crimson pigment containing copper obtained from the feathers of the turakoo, an African bird. Cf. *tetronerythrin.*

turaco-porphyrin. A chromophoric substance, similar to hematoporphyrin, obtained from turacin.

turanose. $C_{12}H_{22}O_{11}$ = 342.18. A disaccharide, consisting of glucose and fructose, formed by partial hydrolysis of melezitose.

turbid. Describing the slight cloudiness of a solution caused by a precipitate or by fine suspended particles.

turbidimetry. The determination of the quantity of matter, in the form of fine suspended particles in a liquid, by measuring the thickness of the liquid that produces a reduction in the visual transmission as compared with a standard solution or a standard pattern. Used in the examination of water and colloidal suspensions. Cf. *nephelometry.*

turbidity value. The temperature at which a solution of an oil in a solvent (*e.g.*, alcohol or acetic acid) shows the first signs of turbidity when cooled under specified conditions. Cf. *Valenta value.*

Turek detonator. Trinitrotriazido benzene.

turkey corn. Corydalis.

t. pea. Tephrosia.

t. red. (1) Harmala red. A coloring matter from the seeds of *Peganum harmala*, a Rutaceae. (2) Madder.

t. red oil. A material obtained by the action of cold concentrated sulfuric acid on castor oil. Used as a wetting agent; and in the preparation of cotton for dyeing with alizarin, etc.

turmeric. Indian saffron, curcuma. The dried rhizomes of *Curcuma longa*, a Scitaminaceae. Used as a condiment, medicinally as the fluid extract, and chemically as an indicator (see *curcuma*).

t. paper. Curcuma paper.

t. root. Hydrastis.

Turnbull's blue. $Fe_3(FeC_6N_6)_2$. Insoluble Prussian blue. A deep-blue precipitate, obtained from excess of a ferrous salt and a solution of potassium ferricyanide.

turnsole. (1) Litmus. (2) A dye prepared from *Chrozophora tinctoria*, an Euphorbiaceae of the Mediterranean countries.

turpentine. Pine cone oil. Terebenthene. Terebinthina. An oleoresin from various coniferous trees, especially those of the Pinus species. Yellowish, sticky masses of characteristic balsamic odor. It contains an essential oil; used in the manufacture of turpentine oil.

Aleppo-	from *Pinus halepensis*
Bordeaux-	from *Pinus maritima*
Canada-	from *Pinus maritima*
Carpathian-	from *Pinus cembra*
common-	from *Pinus palustris*, *P. sylvestris*

Hungarian..... from *Pinus pumilio*
larch..... from *Larix europaea*
Strassburg-..... from *Abies pectinata*
Venice-..... from *Larix europaea*

Cf. *colophony, terebena, terpinene, sylvestrene.* **Chinese-** The volatile oil from *Pistacia terebinthus*, an Anacardiaceae. **t. oil.** An essential oil distilled from turpentine, and consisting of a number of terpenes, (pinene, sylvestrene, dipentene). A colorless, volatile liquid, d.0.869, insoluble in water, soluble in alcohol, oils or benzene. Used extensively as a solvent and vehicle for paints, varnishes, disinfectants, and in pharmacy.

turpeth. The root of *Ipoemoea turpethum*, a Convulvulaceae of India used as a cathartic and substitute for jalap. **t. mineral.** Mercuric subsulfate.

turquoise. Callaite, callainite. A hydrous phosphate of aluminum colored blue by a copper compound; used as a gem.

turtle oil. An oil from the muscles and genital glands of the giant sea-turtle, m.24.6–25.6, d.0.9112, $[n]^{40}1.4599$, sapon. no. 209, iodine no. 64.6. Used as a cosmetic.

tussol. $C_{19}H_{20}O_4N_2$ = 340.2. Antipyrine mandelate, phenylglycolantipyrine. $C_{11}H_{12}N_2OPh\text{-}CHOH.COOH$. A white crystalline powder, soluble in water; used medicinally for whooping cough.

tutanag. Chinese spelter. An alloy of lead and tin used for canisters and tea chest linings.

tutia. Tutty. An obsolete term for zinc carbonate.

tutin. $C_{17}H_{20}O_7$ = 336.2. A poisonous glucoside from the leaves and stems of the toot plant, a *Coriaria* species of New Zealand.

tutocaine. $C_{14}H_{22}N_2O_2.HCl$. Butamin, γ-dimethylamino-α-β-dimethylpropyl-*p*-aminobenzoate, hydrochloride, *p*-aminobenzoyl-dimethylaminomethyl butanol hydrochloride, $Me_2N.CH_2.CHMe.CHMe.OCOC_6H_4NH_2.HCl$. Colorless needles, m.214, soluble in water; used as a local anesthetic.

Tutton's salts. A group of double salts, $M'M''(SO_4)_2.6H_2O$, resembling the alums, (q.v.); where M′ is NH_4, K, Tl etc., M″ is Mg, Zn, Fe, etc. and S can be replaced by Se.

tutty. Tutia.

tuyère. Tweer. A pipe inserted into the walls of a furnace through which an air blast is forced into the furnace.

Tw. An abbreviation for degrees on the Twaddell hydrometer.

Twaddell. A hydrometer scale (q.v.) generally used for technical purposes. If the specific gravity is d:

$Tw° = 200(d - 1)$, or $d = (Tw° + 200)/200$.

Twaddle. Twaddell.

tweens. Trade name of a group of surface-active agents.

tweer, twere. Tuyere.

twin. One of a closely-connected pair. **t. crystals.** A pair of crystals which have grown together in contact. They may coalesce except for a few faces, and usually form a symmetrical figure (a cross or star). **t. electrons.** A pair of electrons that are supposed to form a chemical bond, each atom providing one electron, as in $H:\ddot{\underset{\cdot\cdot}{Cl}}:$. Thus, the pair of electrons between H and Cl in HCl consists of the single electron from hydrogen and the seventh electron of chlorine. See *Lewis' theory, polar bond.* **t. nuclei.** Describing a bicyclic structure; an organic compound that contains two connected rings, as in naphthalene.

Twitchell reagent. A catalyst of fat hydrolysis, prepared by the action of sulphuric acid on oleic acid and naphthalene. It is regarded as a sulphonated addition-product of naphthalene and oleic acid with formula, $C_{18}H_{35}O_2.C_{10}H_6SO_3H$. **T. process.** The splitting of fats by steam in loosely-covered tanks with the aid of T.'s reagent (about 0.5 per cent on the weight of the fat). Cf. *Pfeilring reagent.*

tyllithin. Lithium acetyl salicylate.

tylophorine. An alkaloid from *Tylophora asthmatica*, an asclepiadaceous tree of Southern Asia; used medicinally as an emetic.

tympan. A thick paper, often impregnated with oil or glycerin, used to prevent set-off when backing-up sheets before printing, or for interleaving them after printing.

Tyndall, John. 1820–1893. An English physicist, noted for his experiments with light, sound and magnetism. **T. cone.** The path of light passing through a heterogeneous medium, made visible by means of the solid particles; as, a sunbeam illuminating the dust particles of the air, or a light-beam passing into a colloidal suspension. The cone-shape is due to an analogy of the focusing effect of a lens. **T. effect.** The scattering of light by small particles; as in the T. phenomenon. **T. phenomenon.** A beam of light becomes visible when passing through a turbid solution, fog, or smoke. Cf. *scattering, luminescence, ultramicroscope.*

tyndallimetry. The estimation of the suspended matter in a solution by measuring the intensity of the scattered light from a Tyndall cone.

type. A general or prevailing character. **t. of compounds.** An arbitrary classification of organic compounds which groups together those obtainable from one another by substitution, since they must belong to the same type. More recently type has been used to indicate the presence of typical radicals; as, —OH, —NH_2, —CHO, —COOH, etc. Type differs from class in that the latter refers to the carbon structure, (aliphatic, aromatic, saturated, unsaturated), whereas type indicates the possibility of certain common reactions due to typical radicals. Cf. *classification.* **t. metal.** An alloy used for making printers' type. It consists usually of about 7 parts lead and 2 parts antimony, with small amounts of tin, bismuth, nickel or copper. **t. reaction.** A reaction which is common to a group of related substances.

typhasterol. A phytosterol from the pollen of *Typha orientalis*, a *Typhaceae*. α- White powder, m.133, and levorotary.

typhotoxin. A ptomaine from cultures of Eberth's bacillus.

typical. Pertaining to a certain characteristic, property or standard. **t. compounds.** Fundamental compounds from which a number of others are derived by substitution; as, H_2O HCl, NH_3, CH_4. **t. elements.** The most abundant element of each group of the periodic system, namely:

Non-metals { oxygen and sulfur; nitrogen and phosphorus; carbon and silicon; chlorine; hydrogen

Metals { sodium and potassium; magnesium and calcium; aluminum; iron; copper; zinc; silver; platinum; gold; mercury; lead

tyramine. $C_8H_{11}ON$ = 137.1. p-hydroxyphenylethylamine, aminoethylphenol. $NH_2.CH_2.CH_2.C_6H_4.OH$. An alkaloid obtained from ergot or by heating tyrosine. A white crystalline powder, soluble in water; used medicinally as a heart stimulant and vasoconstrictor. **t. hydrochloride.** $C_8H_{11}ON.HCl$ = 173.5. A colorless crystalline powder, soluble in water; used medicinally as a substitute for pituitary extract.

tyratol. Thymol carbamate.

tyrocidine. An antibiotic component of tyrothricin (q.v.); it is a salt of a polypeptide having a molecular weight of approximately 1260, or a multiple of this number.

tyroleucin. $C_{14}H_{22}O_4N_2$ = 282.3. A split-product of casein or decomposing albumin.

tyrolite. Copper froth.

tyrosal. Salipyrine.

tyrosinase. An enzyme occurring in vegetable and animal tissues, that oxidizes tyrosine to homogentisic acid, melanin or similar pigments.

tyrosine. $C_9H_{11}O_3N$ = 181.14. β-p-hydroxyphenyl-α-aminopropionic acid, amino-hydroxyhydrocinnamic acid, $HO.C_6H_4.CH_2.CH(NH_2).COOH$. An optically-active amino acid occurring in d- (m.311) and l- (m.295) forms, obtained by hydrolysis of many proteins; it occurs in old cheese. (The Greek word, tyros, means cheese.) Silky needles, slightly soluble in water, alcohol or ether; used medicinally as an antidote for snake poisoning. Its isomers are the **o-** (m.249) and **m-** (m.280) compounds. Cf. *erythrosin*. **di-iodo-** A constituent of bath sponges and coral; a source of iodine.

tyrosol. $C_8H_{10}O_2$ = 138.1. *p*-Hydroxyphenethyl alcohol, $HO.C_6H_4.(CH_2)_2OH$. White rhombic crystals, m.93, b.310, formed during putrefaction or yeast fermentation of tyrosine.

tyrosyl. The monovalent radical, $HO.C_6H_4.CH_2.CHNH_2.CO—$, derived from tyrosine.

tyrothricin. An antibiotic substance obtained from cultures of the spore-forming aerobic soil bacterium *Bacillus brevis;* upon treatment with a mixture of equal volumes of acetone and ether it may be separated into a soluble fraction, *gramicidin*, and an insoluble part, *tyrocidine*.

tyrotoxicon. Tyrotoxin.

tyrotoxin. $C_6H_6ON_2$ = 122.1. Diazobenzene hydroxide, PhN:N.OH. A ptomaine in stale milk, cheese or ice cream. Golden-yellow needles, m.90, are produced with a solution of auric chloride.

tysonite. $(Ce,La,Di)F_3$. A native cerium, lanthanum, didymium trifluoride.

U

U The symbol for: (1) uranium; (2) intrinsic energy.

u (1) An abbreviation for unit. (2) The symbol for velocity component of ions.

υ The Greek letter "upsilon."

Υ The Greek capital letter "upsilon."

ν See *nu*.

μ See *mu*.

uabain. Ouabain.

ucuhuba fat. A fat extracted from the ground kernels of *Virola surinamensis*, a Myristicaceae of tropical America; d.0.90, m.47, $[n]_D^{50}$1.450, iodine no. 12.

uintaite. Gilsonite.

ukambine. An alkaloid from African arrow-poisons. Its action is like that of strophanthin.

ulexine. $C_{11}H_{14}ON_2$ = 190.2. An alkaloid from the seeds of *Ulex europaeus*, the common gorse of Europe. It is a local anesthetic and powerful diuretic. Cf. *cytisine*.

ulexite. $NaCaB_5O_9.8H_2O$. An hydrous sodium, calcium borate, found in California.

ullmannite. NiSbS. A native nickel sulfantimonide.

ulmic acid. $C_{20}H_{14}O_6$ = 350.1. Geic acid. An acid from peat, elm sap and elm bark.

ulmin. $C_{40}H_{16}O_{14}$ = 720.1. A gum from the sap and bark of *Ulmus fulva*, slippery elm, an Ulmaceae. **amin-** A gum found in coal, peat and decayed vegetable substances, formed by the action of amino acids on carbohydrates.

ultimate. Fundamental or basic. **u. analysis.** Primary a. The quantitative determination of each element in a compound without regard to molecular combination. Cf. *proximate* and *rational analysis*. **u. lines.** See *raies ultimes*. **u. rational units.** U.R.U. A system of measurement based upon the charge of an electron, $(4\pi e)^2$, which has the dimension of energy × length and from which all other units may be derived. (G. N. Lewis, Phil, Mag. 45, 1923, p. 266.)

ultra- A prefix derived from the Latin "beyond," indicating that the substance or object concerned has values outside of certain limits.

ultracentrifuge. A high-speed centrifuge, used for determining the size and distribution of particles in amicroscopic colloids. **McBain's-** A spinning rotor driven by and suspended in air, and attaining 350,000 revolutions per minute.

ultrafilter. See *filter*.

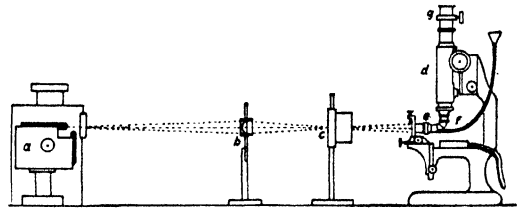
ultrafiltration. Filtration under suction or pressure through a colloidal filter or semipermeable membrane. It is used especially in colloid chemistry, in the preparation of colloidal solutions or suspensions; and for determining the size of the particles in terms of a standard ultrafilter whose pores are of known size.

ultra-gamma rays. Cosmic rays.

ultramarine. $Na_8Al_6Si_6S_2O_{12}$. Artificial lapis-lazuli. A blue pigment, which consists essentially of sodium and aluminum silicates with sodium polysulfides. **genuine-** Lapis-lazuli. **synthetic-** A pigment prepared by melting clay, soda and sulfur or coal; used in paper and the textile industry as a pigment. **yellow-** Barium chromate. **u. green.** U. having a green shade.

ultramicron. A particle less than ¼ of a micron in diameter; the smallest particles visible under the ultramicroscope.

ultramicroscope. Any microscope in which the object is brightly illuminated at right angles to the optical axis of the microscope. Used to detect particles, smaller than 0.1*μ*, which reveal themselves as bright dots of light. Cf. *submicron*, *micron*, *Tyndall cone*.



Ultramicroscope.
(Marshall, "Microbiology.")

ultramicroscopic. Beyond the range of microscopic visibility, but detectable by the ultramicroscope (q.v.).

ultraphonic. Ultrasonic, supersonic. Those air vibrations of high wave-length that are inaudible to the human ear. Cf. *infraphonic*, *phonic*.

ultraphotic. The invisible rays of the ultra-violet and infra-red regions.

ultraquinine. Homoquinine.

ultra-red. Infra-red.

ultrasonic. Ultraphonic.

ultrathermometer. Beckmann thermometer.

ultra-violet. That portion of the spectrum just beyond the violet on the short wave-length side, generally from 180–3,900 Å.U. and emitted

	Ångstrom Units	
visible light	↑	
	4000	non-penetrating
.....	3200	
↑		tan-producing (*Rungling*)
vital	3100	
ray	3000	
(*Hess*)	2900	preferred anti-rachitic (*Heilbron*, *Morton*, *Kamm*)
therapeutic	2800	
UV-rays		
↓	2700	
.....		debated anti-rachitic
	2200	*Schumann* region
W-rays	1800	
	1200	
	150	*Lyman-Millikan* region
X-rays	↓	

by sunlight, and the carbon arc, mercury vapor, tungsten arc and Kromeyer lamps. **far-** Rays of 180–2,900 Å.U. **near-** Rays of 2,900–3,900 Å.U. **vital-** Rays of 2,900–3,100 Å.U. Cf. *radiation*. **u. rays.** Invisible light rays from the ultra-violet region that induce chemical activity and produce fluorescence in many substances. They act on the photographic plate, color p-phenylendiamine paper blue (sunlight does not) and produce a bright green fluorescence in willemite. They are also supposed to have therapeutic properties, and will induce the formation of vitamins in sterols. Cf. *radiation, irradiation, uroxameter, fluorescence analysis*.

ultrawet. Trade name for an alkylated monosodium benzene sulfonate detergent and wetting agent.

ultra-x-rays. Cosmic rays.

umangite. $CuSe.Cu_2Se$. A native copper selenide. Cf. *berzelianite*.

umbellaric acid. $C_8H_{12}O_4$ = 172.09. The dibasic acid

$$CHMe.CH(COOH).CH_2.CH(COOH).CH_2$$

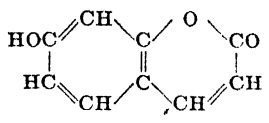
umbellic acid. $C_9H_8O_4$ = 180.00. p-Hydroxycoumaric acid, dihydroxycinnamic acid, $(HO)_2$-$C_6H_3CH:CH.COOH$. An acid obtained from umbelliferone by heating with alkali. A yellow powder; soluble in water, decomp. 125.

Umbelliferae. Parsley family, a group of herbs with hollow stems and flowers having the shape of an umbrella. Many of their seeds are used as spices or drugs; some yield essential oils:

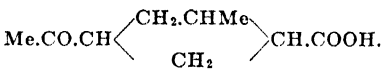
Fruits and Seeds:	
Pimpinella anisum	anise
Foeniculum vulgare	fennel
Conium maculatum	poison hemlock
Carum carvi	caraway
Coriandrum sativum	coriander
Peucedanum (Anethum) graveolens	dill seed
Apium graveolens	celery seed, apiol
Carum ajowan	ajowan
Petroselinum sativum	parsley seed
Oenanthe phellandrium	parsley seed
Oenanthe phellandrium	water hemlock
Cuminum cyminum	cumin seed
Daucus carota	carrot fruit
Roots:	
Ferula sumbul	musk root, sumbul
Imperatoria ostruthium	masterwort
Laserpitium latifolium	white gentian
Levisticum officinale	lovage
Ligusticum filicinum	oshaic acid
Pastinaca sativa	parsnip root
Peucedanum officinale	peucedanin
Sanicula europea	sanicula
Petroselinum sativum	parsley
Angelica officinalis	angelica root
Pimpinella saxifraga	pimpinella
Cicuta virosa	water hemlock
Leaves:	
Conium maculatum	hemlock leaves
Gum Resins:	
Ferula foetida	asafetida
Ferula galbaniflua	galbanum
Dorema ammoniacum	ammoniacum
Ferula persica	sagapenum
Ferula sumbul	sumbul
Pastinaca opopanax	opopanax.

Cf. *aethusine, cynapine, crithmene, hentriacontane, mitsubaene*.

umbelliferone. $C_9H_6O_3$ = 162.1. 4-Hydroxycoumarin. A lactone in galbanum and umbelliferous plants. Colorless crystals, m.223 (sublimes), slightly soluble in water, soluble in alcohol. **methyl-** Resocyanine.



umbellonic acid. $C_9H_{14}O_3$ = 170.11. The monobasic acid



Cf. *pinonic acid, umbellaric acid*.

umbellulic acid. $C_{11}H_{22}O_2$ = 186.17. Colorless crystals, m.23, $b._{160mm}$ 228, from California laurel. Cf. *cocinic acid, undecyclic acid*.

umbellulone. $C_{10}H_{14}O$ = 150.1. A ketone from the oil of *Umbellularia californica*, a laurinaceous tree. It is the chief constituent of California laurel oil, and readily changes to *thymol* by heating under pressure.

umber. Raw umber. A native ferric hydroxide containing manganese dioxide and silicate; a dark brown to brownish-red powder, used as a pigment. **burnt-** A warm reddish-brown pigment produced by heating raw umber.

umbonate. Describing a bacterical culture that has a button-like raised center.

unary. Composed of molecules which are physically and chemically identical, as opposed to associated or dissociated.

uncertainty principle. *Heisenberg* principle.

undark. A luminous paint containing traces of radioactive substances.

undarken. To make an article luminous in the dark by coating it with a luminous paint.

undecalactone. $C_{11}H_{20}O_2$ = 184.15. Peach aldehyde, C14. $Me(CH_2)_6CH(CH_2)_2.CO.O$. A white powder with strong aroma of peach.

undecane. $C_{11}H_{24}$ = 156.2. Hendecane*. A saturated hydrocarbon of the methane series, $Me(CH_2)_9Me$. A colorless liquid, $d._{15°}$0.74, m. −26, b.194, insoluble in water, soluble in alcohol or ether.

undecene. Hendecene*.

undecenoic acid. Undecylic acid.

undecenyl. The monovalent, unsaturated radical $C_{11}H_{21}$—, derived from undecylene.

undecyl. Hendecyl. The monovalent radical $C_{11}H_{23}$—, derived from undecane.

undecylene. Hendecene*.

undecylenic acid. $C_{11}H_{20}O_2$ = 184.2. *9*-Hendecenoic acid*. The unsaturated acid, $Me-CH:CH(CH_2)_7COOH$. A colorless liquid or crystalline mass, d.0.907, m.24, b.295, soluble in water or alcohol.

undecylic acid. $C_{11}H_{22}O_2$ = 186.2. Hendecanoic acid*, $Me(CH_2)_9COOH$. A constituent of castor oil. Colorless scales, m.28, b.212; soluble in water or alcohol. Cf. *umbellulic acid, cocinic acid*. **cyclopentyl-** Hydnocarpic acid.

u. alcohol. Hendecyl alcohol. **u. aldehyde.** Hendecanal*.

under. Below normal. **u. cooling.** Supercooling. **u. meter.** Venturi meter. **u. voltage.** The difference between the potential of a

positive hydrogen electrode and that of a reversible hydrogen electrode. (Cf. *overvoltage.*)

undulate. (1) To have a regular wave-like motion. (2) Describing a bacterial growth with wavy borders and surface.

undulation. (1) A wave-like motion or vibration. (2) The periodic expansion and contraction of bodies; as, steel rails.

undung. Laurel tallow. A vegetable fat obtained from *Litsea* (*Tetranthera*) *laurifolia*, a Lauraceae of tropical Asia.

unedol. The reducing aglucone of unedoside.

unedoside. A glucoside from *Arbutus unedo* whose reducing power is decreased by hydrolysis, a unique property for a glucoside.

ung. An abbreviation for unguentum.

unguentum. (1) The Latin term for an ointment. (2) A simple ointment.

uni- A prefix derived from the Latin, indicating "one." (Greek, mono-).

uniaxial. (1) Having only one axis; as, of a crystal which does not doubly refract light. (2) Having properties in one direction only, as along a particular axis of a crystal.

unicellular. Describing an organism that consists of a single cell; as, the protophyta and protozoa.

unicorn. A plant of the genus *Martynia* (Pedaliaceae). **false-** (1) Aletris. (2) Chamaelirin. (3) Helonias.

unifrequent. Describing a homogeneous beam of light or a radiation consisting of rays of similar wave-lengths.

unimolecular. Monomolecular. (See *reactions.*)

unionized. Not ionized; existing in a non-dissociated molecular form.

unit. (1) A quantity used as a measure. (2) A standardized equipment, which consists of a definite arrangement of devices, considered as a whole; as in a unit process. **Angström-** See *Ångström.* **Board of Trade-** (B.T.U.). See *Board of Trade unit.* **British Thermal-** See *British Thermal unit.* **capacity-** Farad. **c.g.s.-, C.G.S.** Metric units. **derived-** See *derived units.* **electrical-** See *electrical.* **electromagnetic-** See *electromagnetic units.* **electrostatic-** See *electrostatic units.* **e.m.u.-, E.M.U.** Electromagnetic units. **e.s.u.-** or **E.S.U.** Electrostatic units. **fertilizer-** An u. of plant food is 20 pounds, or 1 % of a ton of fertilizer. **force-** The dyne. **fundamental-** See *fundamental units.* **heat-** Calorie. **international-** U. defined by international agreement; as, 1881: volt, ohm, ampere, coulomb, farad; 1889: joule, watt; 1893: henry; 1900: maxwell, gauss; 1930: gilbert, oersted. **light-** See *candle, phot, lux.* **metric-** q.v. **m.k.h.-, M.K.H.** Metric units expressed in terms of meter-kilogram-hour. (Cf. *c.g.s.-units.*) **quantum-** See *Planck's constant.* **ultimate-** q.v. **u.r.u.-, U.R.U.** The ultimate rational units based, upon the charge of an electron. **work-** The erg.

univalent. (1) Describing an element that has only one valency and forms only one series of compounds; as, Na, Mg, or Al. Antonym: polyvalent. (2) Monovalent.

universal. General, applicable in all cases. **u. indicator.** A pH-indicator (q.v.) which changes color over an extended range of pH values. **u. series constant.** Rydberg's constant. The value for N in the equations of the spectrum series. It varies slightly for each element between the values:

$$N_H = 109{,}677.691 \pm 0.06$$
$$N_{He} = 109{,}722.14 \pm 0.04$$
$$N_\infty = 109{,}737.11 \pm 0.06.$$

unofficial. Describing a drug that is not authorized by a pharmacopoeia or formulary.

unorganic. Inorganic.

unorganized. (1) Having no cellular or protoplasmic structure. (2) Amorphous. **u. ferment.** An enzyme that is active in sterilized solutions and is not dependent on cell-life for its action.

unsatisfied. Describing a hydrocarbon which has one or more free valencies. Cf. *free radical, unsaturated.*

unsaturated. (1) Not saturated; describing a solution that is capable of dissolving more solute. (2) Describing an organic compound having double or triple bonds; as, ethylenes, acetylenes.

unslaked lime. Calcium oxide.

unstable. Readily decomposing; as, hydrogen peroxide, fulminates.

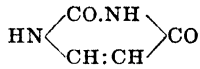
unsymmetrical. Not symmetrical; as the 1.2.4-positions of the benzene ring.

upas. A Javanese arrow-poison containing strychnine (Malay = ipoh). **bohan-** A poisonous resin from the tree, *Antiaris toxicaria* of Java. Cf. *antiarin.*

upsilon. The Greek letter *v*, Υ (see *u*).

uptake. An exit pipe which leads in an upward direction.

uracil. $C_4H_4O_2N_2$ = 112.1. 2.4(1.3) Pyrimidine dione, 2.6-dioxypyrimidine. A pyrimidine base, m.338; a constituent of nucleic acids.



methyl- Thymine.

uraconite Uranic ocher.

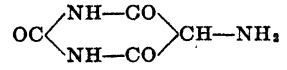
uralin. $C_5H_8O_2NCl_3$ = 236.6. Chloral urethane, $CCl_3CH(OH).NH.COOEt$. A colorless crystalline powder, soluble in water or alcohol; used as a hypnotic.

uralite. (1) A variety of amphibole found in the Ural Mountains. (2) A fireproof substance; asbestos impregnated with sodium silicate and bicarbonate, and chalk.

uralium. A supposed element isolated by Guyard from platinum ores. It has been given the atomic number, 75, and an atomic weight of 187.5, and is probably identical with rhenium.

uramido. Carbamido. **u. acetic acid.** Hydantoic acid.

uramil. $C_4H_5O_3N_3$ = 143.1. Dialuramide, aminobarbituric acid, murexan,



Colorless crystals, soluble in water or alcohol; used in organic synthesis. **thio-** See *thiouramil.*

uramine. Guanidine.

uramino. Carbamido.

uranalysis. Analysis of urine.

uranate. A salt of uranic acid of the general type, $M_2U_2O_7$.

urane. (1) A unit of radioactivity; the $\frac{1}{1000}$ part of a kilurane. (2) Uranium oxide.

uranic. Describing a compound containing hexavalent uranium; as, uranium fluoride. **u. acid.** H_2UO_4 = 304.2. A yellow, insoluble powder consisting of UO_3 in varying degrees of hydration. The salts are derived from

the hypothetical acid, $2UO_3.H_2O$ or $H_2U_2O_7$. **u. ocher.** U_3O_8. Uraconite. An amorphous, yellow native uranium oxide. It contains radium. **u. oxide.** UO_3 = 286.2. Uranium trioxide, uranic anhydride. A yellow or orange powder, d.5.14, insoluble in water, soluble in acids. Used in ceramics, and in the glass, paint, and textile industries.

uranin. $Na_2C_{20}H_{10}O_5$ = 376.2. Sodium fluorescein. A brown powder and sodium salt of fluorescein, used as a reagent.

uraninite. $UO.U_2O_5$. Pitchblende. Native uranium oxide, a source of radium.

uranite. A general term for a group of uranium minerals consisting of the phosphates of uranium with calcium or copper.

uranium. U = 238.07. A heavy metal and the last stable element of the periodic system, atomic number 92. Cf. *transuranium, ekarhenium, ekaosmium.* A hard, heavy, nickel-white metal, d.18.68; insoluble in water or alcohol, soluble in acids, m. red heat. It is radioactive, consists of several isotopes (q.v.), and disintegrates into a number of other elements. (See *radioactive disintegration.*) The isotope of at.wt. 235, when bombarded with slow neutrons, is capable of undergoing fission with explosive violence; the products and rate of reaction depend on the conditions of bombardment. Uranium forms principally tetravalent (*uranous*) or hexavalent (*uranic, uranyl* and *uranate*) compounds, but valencies of 2, 3, 5, and 8 have also been reported. The yellow oxide, UO_3, is amphoteric, and forms the "uranates" with bases and "uranyl" salts with acids. **trans-** See *transuranium.* **U_1, U_2, U_x** etc. See *radioactive elements.*

u. acetate. (1) Uranyl acetate. (2) Uranyl-sodium acetate. **u. ammonium fluoride.** Uranyl ammonium fluoride. **u. barium oxide.** BaU_2O_7 = 725.8. Barium diuranate. An orange powder, soluble in acids. **u. bromide.** UBr_4 = 557.9. Uranous bromide. Black leaflets, d.4.838; soluble in water or alcohol. **u. carbide.** (1) UC_2 = 262.17. Solid, d.11.3, m.2260. (2) U_2C_3 = 512.34. Solid, d.11.28, m.2400. **u. chloride.** (1) UCl_4 = 380.0. Uranous chloride. U. tetrachloride. Dark green, cubic crystals; soluble in water. (2) UCl_3 = 344.51. Uranium trichloride. Purple, soluble crystals. **u. fluoride.** UF_4, uranium tetrafluoride; or UF_6, uranium hexafluoride. **u. glass.** A yellow glass with a green fluorescence, which contains some uranium oxides. **u. hydroxide.** $U(OH)_4$ = 306.15. A green, insoluble powder. **u. iodide.** UI_4 = 745.9. Uranous iodide. Yellow monoclinic crystals, m.500; soluble in water or alcohol. **u. lead.** (1) Radium G (RaG). (2) A mixture of RaG and AcD. See *lead.* **u. minerals.** The ores of u. are numerous and complex and contain the phosphates and vanadates of rare earths. The principal ores (carnotite, uraninite or pitchblende, becquerelite, and autunite) are radioactive. **u. oxides:** The chief oxides are the dioxide UO_2 (uranous oxide), the trioxide UO_3 (uranic oxide), and the tritaoctoxide U_3O_8 (which may be uranosic oxide $UO_2.2UO_3$, uranyl uranate $(UO_2)_2UO_4$, or uranous uranate $U(UO_4)_2$). Others reported are the sesquioxide U_2O_3 (or hemitrioxide), the pentoxide U_2O_5 (or hemipentoxide), and the tetroxide UO_4. **u. oxychloride.** Uranyl chloride. **u. strontium oxide.** SrU_2O_7 = 676.0. Strontium uranate. A yellow powder; soluble in acids. **u. sulfate.** $U(SO_4)_2.8H_2O$ = 574.5. Native as uranvitriol and zippeite. Green monoclinic prisms, m.300, decomp. by water. **u. sulfide.** US_2 = 302.3. Uranous sulfide. A gray powder, m.1100; insoluble in water, soluble in conc. hydrochloric acid. **u. tetrachloride.** U. chloride. **u. tetrabromide.** Uranium bromide. **u.X., u.Y.** See *radioactive elements.* **u. yellow.** Sodium uranate. Used as a pigment in ceramics and the glass industry. **u.Z.** A short-lived isotope of ekatantalum, half-life period, 9.7 hours. Cf. *protoactinium.*

uranocircite. $(UO_2)_2BaP_2O_8$. A uranyl-barium phosphate.

uranophane. $U_2SiO_8.CaSiO_8$. A native uranium calcium silicate.

uranospherite. $U_2O_7(BiO)_2.3H_2O$. A dull orange, scale-like mineral containing radium.

uranospinite. $(UO_2)_2CaAsO_8$. A native uranyl-calcium arsenate.

uranous. Describing a compound containing tetravalent uranium; as, uranium bromide, UBr_4. **u. chloride.** See *uranium chloride.* **u. oxide.** UO_2 = 270.2. Uranium dioxide. A black, octahedral, crystalline powder, d.10.95, m.2176; insoluble in water or alcohol, soluble in acids or alkalis. **u. uranic oxide.** Uranyl uranate.

uranvitriol. Johannite. A native uranium sulfate containing copper.

uranyl. The bivalent radical, UO_2=, derived from UO_3; it forms many salts with acids; these ionize to the positive ion, UO_2^{++}, and produce a yellow color in solution. **u. acetate.** $UO_2(C_2H_3O_2)_2.2H_2O$ = 424.3. Uranium acetate. A yellow, crystalline powder, d.2.893, soluble in water or alcohol. Used as a reagent and in volumetric analysis. **u. ammonium carbonate.** $UO_2CO_3.2(NH_4)_2CO_3$ = 522.3. Small, transparent, yellow crystals, soluble in water; used in ceramics and the glass industry for uranium glazes and glasses. **u. ammonium fluoride.** $UO_2F_2.3NH_4F$ = 419.3. Uranium ammonium fluoride. A greenish, fluorescent, crystalline powder, soluble in water, insoluble in alcohol; used in x-ray screens. **u. benzoate.** $UO_2(C_7H_5O_2)_2$ = 514.3. Uranium benzoate. A yellow powder; slightly soluble in water, soluble in alcohol. **u. calcium phosphate.** $(UO_2)_2Ca(PO_4)_2$ = 770.5. Greenish-yellow crystals; soluble in water. **u. chloride.** UO_2Cl_2 = 341.1. Uranium oxychloride. Yellow, hygroscopic crystals, soluble in water or alcohol. It fuses and decomp. if heated. **u. ferrocyanide.** $(UO_2)_2Fe(CN)_6$ = 752.25. Uranyl-hexacyano ferrate. A reddish-brown powder; insoluble in water. **u. formate.** $UO_2(HCO_2)_2.H_2O$ = 378.17. Yellow octahedral crystals, d.3.695, slightly soluble in water. **u. hydroxide.** $UO_2(OH)_2$ = 304.19. Uranic acid, H_2UO_4. A white solid. **u. nitrate.** $UO_2(NO_3)_2.6H_2O$ = 502.3. Uranium nitrate. Yellow, deliquescent crystals, d.2.807, m.59, b.118, soluble in water, alcohol or ether. Used as a reagent and indicator; medicinally as an antidiabetic; in ceramics; in the glass industry; and in photography. **u. oxalate.** $UO_2C_2O_4.3H_2O$ = 412.2. Uranium oxalate. A yellow powder; insoluble in water, soluble in acids. **u. oxide.** Uranium trioxide. **u. phosphate.** $UO_2HPO_4 + 4H_2O$ = 438.3. A yellow crystalline solid, insoluble in water or acetic acid. **u. potassium nitrate.** $UO_2(NO_3)_2.2KNO_3$ = 596.5. A greenish-yel-

low, crystalline powder; soluble in water. **u. potassium sulfate.** $UO_2SO_4.K_2SO_4$ = 540.5. A greenish-yellow powder; soluble in water. **u. sodium acetate.** $UO_2(C_2H_3O_2)_2.2NaC_2H_3O_2$ = 552.3. Uranium sodium acetate, uranium acetate. A yellow, crystalline powder; soluble in water or alcohol; used as a reagent. **u. sodium sulfate.** $UO_2SO_4.Na_2SO_4$ = 508.2. A yellowish-green crystalline substance; soluble in water. **u. sulfate.** $2UO_2SO_4.7H_2O$ = 858.6. A yellow crystalline powder, d.3.28; soluble in water. **u. sulfide.** UO_2S = 302.3. A brown powder, decomp. by heat, slightly soluble in water. **u. uranate.** U_3O_8 = 842.6. Uranous uranic oxide, $(UO_2)_2UO_4$. An olive-green, crystalline powder, d.7.31, decomp. by heat, insoluble in water or alcohol, soluble in acids. **u. zinc acetate.** A solution of u. acetate and zinc acetate in acetic acid which gives crystals of characteristic shape with sodium salts.

urao. A native sodium carbonate and bicarbonate from South America.

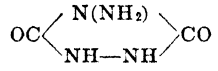
urari. Curare.

urase. Urease.

urasol. $C_{19}H_{16}O_8$ = 372.1. Acetylmethylenedisalicylic acid, afsal, $CH_2[C_6H_3(COOH)OC_2H_3O]_2$. A yellowish powder, insoluble in water, soluble in alcohol or ether; used medicinally as an antiseptic.

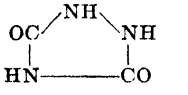
urate. Lithate. A salt of uric acid.

urazine. $C_2H_4O_2N_4$ = 116.0. Aminourazole. The heterocyclic compound



Cf. *diurea*.

urazole. $C_2H_3O_2N_3$ = 101.2. Hydrazodicarbonimide, diketotriazolidine. Colorless crystals, m.244; soluble in alcohol. **amino-** Urazine. **1-phenyl-** $C_2H_2O_2N_3Ph$ = 177.2. Colorless crystals, m.263. **3-phenyl-** Colorless crystals, m.203; soluble in alcohol. **thio-** See *thiourazole*.



Urbain, Georges. 1872–1938. A French chemist, noted for work on the rare earths.

Ure, Andrew. 1778–1857. A Scotch chemist noted as author (*A Dictionary of Chemistry*, 1821) and for technical methods. **U. eudiometer.** A long U-shaped glass-tube closed at one end. On the closed side are two electrodes and a graduated scale used to measure the volumes of gas mixtures.

urea. CH_4ON_2 = 60.1. Carbamide. $NH_2.CO.NH_2 \rightleftharpoons NH_2.CNH.OH$ (pseudo u.). A colorless, tetragonal, crystalline powder, d.1.323, m.132, decomp. by further heat into biuret and ammonia; soluble in water, alcohol or ether. It is the end-product of mammalian protein metabolism, the chief nitrogenous constituent of urine, and the first organic compound synthesized (Wöhler, 1828). It forms addition compounds with salts. Used as a reagent for detecting lignin; in pyrotechnics; and in organic synthesis. Its derivatives are characterized by the prefix ureido-* or the suffix -urea*; as, butylurea*, $C_4H_9NHCONH_2$; butyryl urea*, $C_4H_9CONHCONH_2$. The bivalent radical—NH.CO.NH—is urylene*. *Cf. ureide, uramido.* **ψ-** See pseudo *urea*. **acetonyl-** See *acetonylurea*. **acetyl-** See *acetonylurea*. **alkene-** Compounds of the type RHN.CO.NHR, (urylenes), or $R_2N.CO.NR_2$. **allylthio-** Allysulfocarbamide. **amino-** Semicarbazide. **bi-** See *biurea*. **bromoethylbutyryl-** Adaline. **bromoisovaleryl-** Bromural. **carbamido-** Biurea. **carbamyl-** Biuret. **carbonyl-** Triuret. **cinnamyl-p-oxyphenyl-** Elbon. **di-** See (1) *diurea*, (2) *urazine*, (3) *uril*. **diamino-** Carbohydrazide. **diphenyl-** Carbanilide. **ethoxyphenyl-** Sucrol. **ethylene-** Oxazoline (μ-amido). **guanyl-** See *guanyl* urea. **hydroxy-** Derivatives of the compound, $NH_2.CO.NH.OH$. **imino-** Guanidine. **malonyl-** Barbituric acid. **mesoxalyl-** Alloxan. **oxalyl-** Parabanic acid. **phenetyl-** Sucrol. **phenylene-** Benzimidazolone. **phenylhydrazine-** Diphenylcarbazide. **propylene-** Oxazoline, (μ-amido-α-methylene-). **pseudo-** The tautomeric form of urea, $NH_2.C:NH.OH$. **selen-** Selenurea. **tartronyl-** Dialuric acid. **thio-** Thiourea.

u. acetate. A mixture of urea and acetic acid of varying composition. **u. apparatus.** A device for the rapid determination of urea by the action of urease. **u. carboxylic acid.** Allophanic acid. **u. citrate.** $CH_4ON_2.C_6H_8O_7$ = 252.2. Colorless, crystalline powder; soluble in water or alcohol. **u. hydrochloride.** $CH_4ON_2.HCl$ = 96.6. Colorless deliquescent crystals, soluble in water. Used medicinally, with quinine hydrochloride, as a local anesthetic. **u. nitrate.** $CH_4ON_2.HNO_3$ = 123.1. Colorless scales, slightly soluble in water; used medicinally. **u. oxalate.** $CH_4ON_2.C_2H_2O_4$ = 150.1. Colorless crystals; soluble in water or alcohol. **u. quinate.** $(CH_4ON_2)_2.C_7H_{12}O_6$ = 312.3. Urol. Colorless prisms, m.107; soluble in water; used medicinally. **u. quinine.** Quinine and urea hydrochloride. **u. stibamine.** $NH_2.CO.NH.C_6H_4.SbO_3H.NH_4$. A white powder used in the treatment of kala-azar.

ureameter. Ureometer. An apparatus for determining the amount of urea in a liquid by measuring the volume of nitrogen evolved. Cf. *urinometer*.

urease. Urase. A crystallizable enzyme occurring in numerous bacteria and fungi, and in Jack beans, that converts urea into ammonium carbonate. A fine, nearly colorless powder, or white octahedra, soluble in slightly alkaline water, and giving a protein reaction (globulin). Its isoelectric point is pH 5.05, it is inactivated by metals, and contains 51–52 % C, 7.1 % H, 15.4 % N, 24.1 % O, 1.2 % S and 2 % ash; used as a reagent for determining urea. Cf. *uricase*.

urechitin. $C_{28}H_{42}O_8$ = 506.4. A glucoside from *Urechites suberecta*, the Savannah flower or yellow nightshade, an apocynaceous plant.

urechitine. $C_{24}H_{42}O_8.H_2O$ = 476.4. An alkaloid from *Urechites suberecta*, an apocynaceous plant.

urechitoxin. $C_{13}H_{20}O_5$ = 256.2. A poisonous glucoside from *Urechites suberecta*, an apocynaceous plant.

ureide. (1) A derivative of urea; as,

$NH_2.CO.NHEt$	ethylurea
$NH_2.CO.NHCOMe$	acetylurea
$NH_2.CO.NH.CO.COOH$	oxaluric acid
$NH_2.CO.NH.CO.CO.COOH$	alloxanic acid
$NH_2.CS.NH_2$	thiourea
$NH_2.CO.OEt$	urethane
$NHPh.CO.OEt$	euphorine.

(2) A compound analogous to the amides, derived from carboxy acids and containing the

—NH.CONH$_2$ radical; as, R.CO.NHCONH$_2$. **cyclic-** A compound formed by replacement of one H of each NH$_2$ group by a dibasic acid; as, in barbituric acid, alloxan. **di-** A compound containing two ureido radicals. **pseudo-** A compound of the type NH$_2$.CNH.OR.

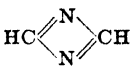
ureido. (1) The bivalent radical, —NH.CO.-NH—. (2) Carbamido.

ureometer. Ureameter.

ureous acid. Xanthine.

-uret. An obsolete suffix, indicating a binary compound of sulfur, arsenic, phosphorus, carbon, etc. with some other element. It is now superseded by the suffix -ide; as, sulfu*retted* hydrogen = hydrogen sulf*ide*.

urete. $C_2N_2H_2$ = 54.1. The heterocyclic compound,



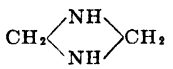
1.2-dihydro- Uretine. **tetrahydro-** Uretidine.

urethan. A derivative of urethane; as, adalin, hedonal, neurodin, thermodin.

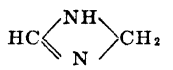
urethane. $C_3H_7O_2N$ = 89.1. Ethylcarbamate, ethylurethan, NH$_2$.CO.OEt. Colorless needles, d.$_{20°}$0.986, m.49, b.184; soluble in water, alcohol or ether. Used medicinally as a hypnotic and in organic synthesis. **acetylethoxyphenyl-** Thermodin. **acetyloxyphenyl-** Neurodin. **amyl-** Amylcarbamate. **chloral-** Uralin. **ethyl-** Urethan. **ethylchloral-** Somnal. **ethylidene-** q.v. **phenacetin-** Thermodin. **phenyl-** q.v. **piperidyl-** q.v. **thio-** q.v. **thymol-** Thymol carbamate. **trichloro-** Voluntal.

urethylan. $C_2H_5O_2N$ = 75.05. "Methylurethane," methylcarbamate, NH$_2$.CO.OMe. A white, crystalline powder, m.52, b.177; soluble in water or alcohol.

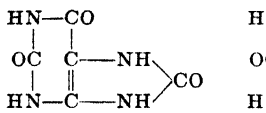
uretidine. $C_2H_6N_2$ = 58.1. Tetrahydrourete.



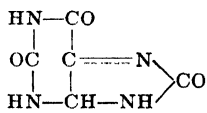
uretine. $C_2H_4N_2$ = 56.1. 1.2-dihydrourete.



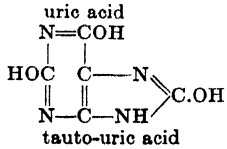
uric acid. $C_5H_4O_3N_4$ = 168.1. Triketopurine, 2.6.8-trioxypurine.



uric acid



iso-uric acid



tauto-uric acid

Colorless scales, d.1.85, decomp. by heat, slightly soluble in water. Used in organic synthesis, and occurs in the body as the end-product of the purines of muscle and cell nuclei. **iso-** An isomeric form of uric acid. **tauto-** A tautomeric form of uric acid. **trimethyl-** Caffeine. Cf. *purine derivatives*.

uricase. An enzyme in animal tissues, that splits uric acid to allantoin, urea and glycocoll. It is destroyed by an excess of carbon dioxide. Cf. *urease*.

uricoclastic. Uricolytic.

uricolytic. Uricoclastic. An enzyme that decomposes uric acid.

uridin. $C_9H_{12}N_2O_6$ = 244.13. Uracil-*d*-riboside, $C_4H_3N_2O_2.C_5H_9O_4$. A nucleoside, m.150, from nucleic acid. **u. phosphoric acid.** A nucleotide, m.202, from nucleo-proteins.

uril. A compound of the type RNH.CO.-NH.NH.CO.NHR. See *biurea*.

urine. A fluid secreted by the kidneys and discharged from the bladder. Normally, a clear amber-colored liquid of slight acid reaction, d.1.005 to 1.030. Composition:

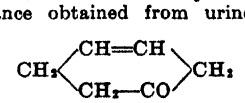
water	96 %
urea	2.3 %
sodium chloride	1.1 %
phosphates	0.2 %
sulfates	0.1 %
other organic compds	0.3 %

u. analysis. The qualitative and quantitative examination of urine. It is of great diagnostic value, *e.g.*,

	Normal
A. Physical characteristics:	
1. Amount in 24 hours	1250–1500 cc. (varies with food)
2. Specific gravity	1.015–1.025
3. Color	amber (pale straw to orange)
4. Transparency	clear
5. Odor	slightly aromatic
6. Consistency	aqueous
7. Reaction	faintly acid (or amphoteric)
8. Solids in 24 hours	60–65 grams
B. Chemical Characteristics:	
Inorganic constituents:	25–30 grams per day
9. Chlorides	10–15 gm.
10. Phosphoric acid	2.5–3.5 gm.
11. Calcium phosphate	0.3–0.4 gm.
12. Sulfuric acid	1.5–2.5 gm.
13. Sulfates of Na, K etc.	1.3–3.0 gm.
14. Carbonates and Bicarbonates (in fresh alkaline urine)	varies
15. Iron	trace
16. Ammonia	trace
17. Carbonic acid	4–9 volumes
18. Oxygen	0.2–0.6 vol.
19. Nitrogen	0.7–0.8 vol.
Organic constituents:	35–40 grams per day
20. Urea	30–40 gm.
21. Uric acid	0.7–1.0 gm.
22. Hippuric acid	0.3–1.0 gm.
23. Creatinine	0.5–1.0 gm.
24. Acetone	trace
25. Mucus	trace

Abnormal constituents: albumin, sugar, pus, blood, diacetic acid, indican, hydrogen sulfide. Cf. *urinometer, Haine's coefficient, Haeser's coefficient, Bang method, Benedict test, Cole's method, Ehrlich's solution, Trommer's test.*

urinoid. C_8H_8O = 96.1. Cyclohexene-3-one. A substance obtained from urine, which is



supposed to cause its characteristic odor.

urinometer. Urometer. An hydrometer for determining the specific gravity of urine. Cf. *ureameter.*

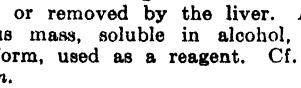
uritone. A brand of hexamethylenetetramine.

urobenzoic acid. Hippuric acid.

urobilin. $C_{33}H_{40}O_7N_4$ = 592.36. Hydrobilirubin. A bile pigment produced by the putrefaction of bilirubin in the gut and excreted in the kidney or removed by the liver. A brown, resinous mass, soluble in alcohol, ether or chloroform, used as a reagent. Cf. *Ehrlich's solution.*

urobromohematin. $C_{68}H_{94}O_{26}N_8Fe_2$. A coloring matter in the urine of lepers; it is a derivative of hemoglobin.

urocanic acid. $C_6H_6O_2N_2$ = 138.1. Imidazoleacrylic acid. The heterocyclic compound,



It is a ptomaine derived from histidine, and occurs in dog's urine. White crystals, m.224, very slightly soluble in water. Cf. *urocaninic acid.*

urocanin. $C_{11}H_{19}ON_4$ = 223.19. A base in the urine of dogs.

urocaninic acid. $C_6H_6O_2N_2.2H_2O$ = 174.2. An acid from the urine of dogs; decomp. by heat to CO_2 and urocanin. Cf. *urocanic acid.*

urochrome. $C_{43}H_{51}O_{26}N$ = 997.5. A yellow coloring matter in urine (0.37–2.0 gm. per day).

urochromogen. A substance occurring in tissues; it is oxidized to urochrome.

urocitral. Theobromine sodium citrate.

uroerythrin. An orange-red pigment in urine.

urol. Urea quinate.

urolith. A calculus occurring in urine.

uromelanin. $C_{16}H_{43}O_{10}N_7$ = 517.6. A black pigment, which sometimes occurs in urine as a decomposition product of urochrome.

urometer. See *urinometer, ureameter.*

uron. A proposed name for the positive nucleus of an atom. (See *proton, prouton.*)

uronic acid. A group of polyhydroxyaldehyde acids, $CHO.(CHOH)_xCOOH$, derived from monosaccharides; made by oxidizing hexoses or pentoses whose aldehyde group is blocked (as in glucosides). *E.g.,*

penturonic acids..... $CHO(CHOH)_3COOH$
as, arabinuric, ribosuric acid.
hexuronic acids..... $CHO(CHOH)_4COOH$
as, glucuronic, galacturonic acids.
hepturonic acids..... $CH(CHOH)_5COOH$.

Their lactones are sometimes included in the definition; as, ascorbic acid.

urophan. A substance which, when taken into the body, appears again chemically unchanged in the urine.

uropherine. Theobromine lithium. **u. benzoate.** Uropherine *B.* Theobromine lithium benzoate. **u. salicylate.** Theobromine lithium salicylate.

uropittin. $C_9H_{10}O_3N_2$ = 194.1. A resinous decomposition-product of urochrome.

uroprotic acid. $C_{88}H_{116}O_{34}N_{20}S$ = 2085.1. An acid protein from urine.

uropterin. A yellow pigment from the purine fraction of human urine.

urosine. $C_7H_{11}O_6Li$ = 198.09. Lithium quinate, $C_6H_7(OH)_4.COOLi$, in a 50 % aqueous solution; used for gout.

urotropine. Hexamethylenetetramine. **u. quinate.** Quinotropine. **u. salicylate.** Saliformine. **u. tannin.** Tannopin.

uroxameter. A mixture of 20 cc. of a 2 % solution of oxalic acid, 5 cc. of a 1 % solution of uranyl acetate, and 20 cc. of water; used to measure the activity of a source of ultra-violet light.

uroxanthin. A yellow pigment of urine.

ursanic acid. $C_{30}H_{48}O_2$ = 440.4. A colorless acid, m.224, obtained by reduction and saponification of methylarsonate.

ursin. Arbutin.

ursol. p-Phenylenediamine.

ursolene. A dark grey wax, m.192, from cranberry skins. At over 200° it hardens to a mass resembling montan wax.

ursolic acid. $C_{30}H_{48}O_3$ = 456.4. Urson, malol, prunol. An unsaturated, monobasic hydroxy acid, $C_{29}H_{46}(OH)COOH$, in the wax covering the leaves of *Arctostaphylos uva-ursae* (bearberry), *Prunus serotina* (wild cherry) and the fruit of *Pyrus malus* (apple). A colorless powder, m.267; insoluble in water, soluble in alcohol, ether or chloroform.

urson. Ursolic acid.

ursonic acid. $C_{30}H_{46}O_3$ = 454.4. A ketonic acid whose methylester is obtained by oxidation of methylursolate.

urstoff. Protyle.

urtica. Stinging nettle. The dried herb of *U. dioica,* an Urticaceae. It contains tannin and glucosides; used medicinally as a diuretic and hematinic.

Urticaceae. The nettle family, a group of plants including Moraceae, Ulmaceae and Cynocrambaceae, from which various drugs are obtained:

Ulmus fulva	slippery elm bark
Ulmus compestris	elm bark
Humulus lupulus	hops
Cannabis sativa	Indian hemp
Urtica dioica	stinging nettle
Ficus carica	fig
Morus rubra	mulberry

See *ebul, fustic, morus, osage orange, ramie.*

u.r.u. or **U.R.U.** An abbreviation for ultimate rational units. Cf. *c.g.s., e.s.u., e.m.u.*

urunday. A vegetable tanning agent.

urusene. $C_{15}H_{28}$ = 208.20. A hydrocarbon from urushi, Japanese lac, the secretion of *Rhus vernicifera,* an Anacardiaceae, the lacquer-tree. Cf. *rhus.*

urushic acid. $C_{22}H_{36}O_2$ = 344.28. Laccol. An acid from the juice of the Japanese lac tree.

urushiol. $C_6H_3(OH)_2C_{15}H_{27}$ = 316.3. A pale, oily catechol derivative. It occurs in *Rhus vernicifera,* and induces sensitiveness to poisoning.

urycury oil. An oil similar to and probably identical with babassu oil, q.v.

urylene. The bivalent radical —NH.CO.NH—. See *urea,* alkene *urea.*

usnaric acid. $C_{36}H_{32}O_{15}$ = 622.18. An acid from the lichen, *Usnea barbata.*

usnic acid. $C_{18}H_{16}O_7$ = 344.22. Usninic acid. An acid derived from *Usnea barbata,* a large lichen growing on forest trees. A solid, levo-, m.190; dextro- m.195. Insoluble in water, soluble in ether, slightly soluble in alcohol.

U.S.P. or **U.S. Phar.** An abbreviation for United States Pharmacopoeia (12th. Edn., 1942).

ustilagine. An alkaloid obtained from ustilago.

ustilago. Corn smut. A mold-like fungus parasitic on maize, and resembling ergot. It contains several alkaloids (ustilagine, secaline); used as an ergot substitute.

utilities. A proposed name for all useful minerals. They are subdivided by M. E. Wadsworth into:

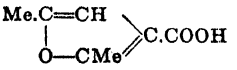
ceramites	fictile or ceramic materials
chalicites	binding or limes, cements
chemites	chemical raw materials
chromatites	color materials
coprites	fertilizers
ignites	pyrotechnic materials
lubricites	lubricating materials
metallites	metalliferous ores
pharmacites	medicinal minerals
pyrolites	refractory minerals
rholites	fluxes
salites	saline minerals
techtonites	building materials
thermites	fuel minerals
tribolites	abrasive minerals
vitrites	vitrifying minerals

U.V. Ultra-violet.

uva. Raisins. **u. ursi.** Bearberry leaves. The dried leaves of *Arctostaphylos uva-ursi*, an Ericaceae. It contains arbutine, ericoline and urson; used medicinally as a tonic and diuretic.

uvarovite. $(CaO)_3Cr_2O_3Si_3O_6$. Uwarowite. A calcium-chromium garnet.

uvic acid. $C_7H_8O_3$ = 140.06. Pyrotritartaric acid, dimethylfuranecarboxylic acid, uvinic acid,



Colorless needles, m.135; slightly soluble in water, soluble in alcohol or ether. It is formed by the dry distillation of tartaric acid.

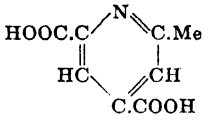
uvinic acid. Uvic acid.

uviol. A glass which transmits ultra-violet light.

uvitic acid. $C_9H_8O_4$ = 180.06. Mesitic acid, 5-methyl-isophthalic acid, 5-methyl-benzene-1.3-dicarboxylic acid. $Me.C_6H_3(COOH)_2$. Colorless needles, m.287; insoluble in water, soluble in alcohol or ether. iso- m.175, soluble in alcohol or ether, insoluble in water.

uvitinic acid. $C_9H_8O_4$ = 180.06. Methyl phthalic acid $C_6H_3Me(COOH)_2$. White crystals, soluble in water.

uvitonic acid. $C_8H_7O_4N$ = 181.1. 2-methyl-pyridine-4.6-dicarboxylic acid. The heterocyclic compound,



A colorless crystalline powder, m.244, decomp. 274.

uvoflavin. Vitamin B_2.

uwarowite. Uvarovite.

uzara. The powdered root of an African asclepiadaceous plant; used for diarrhea and bacillary dysentery.

uzarin. $C_{75}H_{108}O_{30}$ = 1488.86. A glucoside from uzara.

V

(1) The symbol for vanadium. An abbreviation for: (2) volt; (3) velocity; (4) volume; V_p = at constant pressure, V_t = at constant temperature.

v- An abbreviation for vicinal.

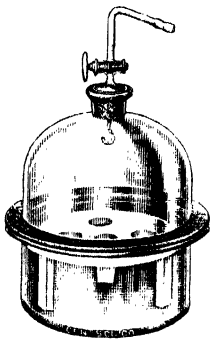
ν See *nu*.

υ See *upsilon*.

V.S. Abbreviation for volumetric solution.

vaccenic acid. $C_{18}H_{34}O_2$ = 282.0. An isomer of oleic acid, *trans*-octadecen-*11*-oic acid, in beef, mutton or butter fats.

vaccine. (1) A bacterial suspension used to produce active immunization by injection or inoculation. (2) The lymph from a cow-pox vesicle.



Vacuum desiccator.

vaccinium. Whortleberry, European huckleberry. The dried herb and fruit of *Vaccinium myrtillus*, an Ericaceae, containing quinic acid, myrtillin and arbutin. Used medicinally as a diuretic.

vacuum. (1) Strictly, a space which contains no fluid. (2) Any space from which air or other gases has been completely or partly removed. Its presence is measured in relation to the air-pressure (760 mm.) and expressed in mm. of mercury.

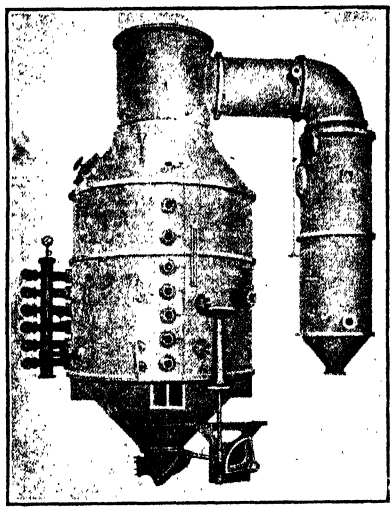
	mm. of Hg (relative)	mm. of Hg (absolute)
water pump	(760 − 7) = 753 mm.	7.00 mm.
Sprengel mercury pump		0.001 mm.
Geryk oil pump		0.0002 mm.
Toepler mercury pump		0.00001 mm.
Charcoal in liquid air		0.0000008 mm.
Gaede molecular pump		0.0000002 mm.

Other units and their equivalents are:

Atm.	mm. Hg	μ Hg	Bars
1	760	760,000	1.013569
0.00132	1	1000	1.333
0.0000013	0.001	1	1.333
0.00000099	0.00075	0.75	1

high- Rarefaction to a pressure below 0.01 mm., such as exists in x-ray tubes. **low-** A rarefaction from 50–1 mm. **Toricellian-** The vacuum in the portion of a barometric tube between the mercury and the closed top.

v. desiccator. An apparatus in which a substance is dried under reduced pressure (see illustration). **v. distillation.** Distillation under reduced pressure; used extensively in the chemical industry. **v. evaporation.** Evaporation in vacuo; as in a v. desiccator or v. pan. **v. fan.** A surface fan. **v. filter.** A device for filtration under reduced pressure or by suction. **v. gases.** (1) The gases obtained by heating solids (*e.g.*, metals) in a v. (2) The residual gas in a v. tube. **v. lamp.** See *lamp*.



Vacuum pan.

v. pan. A closed retort used in industry for vacuum distillation (see illustration). **v. pump.** A suction pump, especially those devices that exhaust air or other gases until a high vacuum is created. Most effective are those using mercury (Sprengel pump) or the phthalates (Hickman pump). V. obtained are:

hyvac pump	4×10^{-4} mm. Hg
megavac	1×10^{-4} mm. Hg
hypervac	5×10^{-5} mm. Hg
aristovac	3×10^{-7} mm. Hg

v. pump oil. An organic liquid used in place of mercury in v. pumps, especially in the Hickman pump. *E.g.*,

n-butyl phthalate	2×10^{-4} mm. Hg
n-amyl phthalate	2.5×10^{-5} mm. Hg
n-hexyl phthalate	3×10^{-6} mm. Hg
n-heptyl phthalate	2.5×10^{-7} mm. Hg
n- octyl phthalate	5×10^{-8} mm. Hg
n-ethyl hexyl phthalate	5×10^{-7} mm. Hg
benzyl phthalate	1.2×10^{-7} mm. Hg

v. still. A v. pan. **v. tar.** A tar obtained from coal by vacuum distillation. It is rich in aliphatic and aromatic hydrocarbons. **v. tube.** Any partly-exhausted, sealed, glass vessel that contains a gas at low pressure; used for the production of luminous electric discharges; as,

x-ray tubes, Crookes' tubes. v. vessel. Dewar flask.

vadose. The ground water which extends only to a slight depth below the earth's surface. In general, any water of surface origin; as rain, spring, well and ground water. Antonym: juvenile water, q.v.

valence. (1) The capacity of an atom to combine with other atoms in definite proportions. (2) Also applied by analogy to radicals and atomic groups. Valence is measured with the combining capacity of a hydrogen atom taken as unity, thus:

HCl	chlorine is monovalent
H_2O	oxygen is divalent
H_3N	nitrogen is trivalent
H_4C	carbon is tetravalent

Its value may be any integer from 1 to 8 (see value for each element under *periodic chain*). According to electronic concepts it is due to the "valence electrons," or the electrons located in the outer shell of an atom. Cf. *bond*. This is illustrated for the first row of the periodic system as follows:

Li· Be: B: ·C· ·N· :O: :F:

where each dot represents a valence electron. In general the electrons in compounds arrange themselves in groups of eight, thus:

Li :F: Li :O: Li

Be :O: B :N:

A *positive* v. indicates the number of electrons that an atom can *give* up; thus, Li = 1, Be = 2. A *negative* v. indicates the number of electrons that an atom can *take* up; thus, F = 1, O = 2. A *co-valence* indicates the number of pairs of electrons which an atom can share with its neighboring atoms. According to some theories the two valencies of each element are of opposite sign (the normal- and contra-valencies); since every element has a total valence of 8, if the normal-valence is $+x$ the contravalence is $-(8-x)$.

Any atom that gives or takes ONE electron is monovalent

Any atom that gives or takes TWO electrons is divalent

Any atom that gives or takes THREE electrons is trivalent

Any atom that gives or takes FOUR electrons is tetravalent

Any atom that gives or takes FIVE electrons is pentavalent

Any atom that gives or takes SIX electrons is hexavalent

Any atom that gives or takes SEVEN electrons is heptavalent

Any atom that gives or takes EIGHT electrons is octavalent.

An element or its atom may exist in several stages of oxidation and thus form several corresponding series of compounds (q.v.), *e.g.*, ferrous and ferric, sulfurous and sulfuric. Hence, an element whose atom exhibits:

one valence is	univalent
two valencies is	bivalent
three valencies is	tervalent
four valencies is	quadrivalent
five valencies is	quinquevalent

See *Werner's coordination theory, bond*. **active-** The commonest v. of an element when the latter can exhibit more than one v. **auxiliary-** Covalence. **chief-** (1) The maximum v. which an element possesses. (2) The v. shown by the greatest number of stable compounds. **co-** Auxiliary v. The valence existing in the form of shared pairs of electrons between two molecules; as, NH_3—H_2O or NH_3—HCl. It is opposed to electro v. **contra-** Co-v. **divided-** A bond which oscillates from one atom to another. It is represented in structural formulas by a forked line, thus —<. **electro-** See *electrovalence, polar bond*. **free-** The v. that appears to be unsatisfied, as in free radicals. **maximum-** The highest stage of oxidation of an element. **negative-** V. due to an atom taking up electrons; as of chlorine. **normal-** The v. expressed according to the group of the periodic system. **null-** Zero v. No v., as in the case of the inert gases, which form no compounds. **partial-** An unsaturated or divided v. **principal-** The normal v. of an atom or radical, as distinct from its residual v. **positive-** V. due to an atom giving up electrons; as, sodium. **residual-** Supplementary-v. The v. by virtue of which complex compounds may be produced from apparently saturated molecules. **rotating-** V. due to oscillation of electrons between two atoms; as, the hydrogen between the two oxygen atoms in —COOH. Cf. *bond*. **semi-** See *semivalence*. **supplementary-** Residual v.

v. bonds. Any pair of electrons that consists of one electron from each of the two atoms they unite:

Na—Cl or Na :Cl:

It is assumed that each bond consists of a pair of electrons in more or less rapid vibration. If these vibrations are rapid, the compound is colorless or emits ultra-violet rays, and if they are slow, the compound is colored. Cf. *bond, polar*. **v. electrons.** The mobile electrons located outside the kernel or in the outer shell of an atom. Atoms that lose these electrons become positive ions, and atoms that gain these electrons become negative ions. **v. number.** Polar number. A negative or positive number that indicates the stages of oxidation of an element according to the number of electrons lost (positive) or gained (negative). It is determined from the formula of a stable compound by assuming that the sum of the v. numbers is zero, and that hydrogen is always +1 and oxygen always −2; thus,

H O H; Na O H

$1+(-2)+1=0$ $1+(-2)+1=0$

or Na_2 S O_4

(2×1) (4×2)

$2+6+(-8)=0$

v. tautomerism. A dynamic isomerism in which the + and − charges produced by a moving double linkage are neutralized by the concomitant movement of a second double linkage, so that ions do not separate. Cf. *ionotropy*.

valency. The phenomena of valence.

Valenta value. The turbidity value (q.v.) of an oil with glacial acetic acid as solvent.

Valentine, Basil. See *Basil*.

valentinite. Sb_2O_3. White antimony. A native antimony trioxide.

valeral. Valeraldehyde.

valeraldehyde. $C_5H_{10}O$ = 86.11. Valeral, valeric aldehyde, amyl aldehyde, pentanal*, $C_4H_9.CHO$. **normal-** $Me(CH_2)_3CHO$. A colorless liquid, d.0.819, b.103.4, slightly soluble in water, soluble in alcohol or ether. **iso-** $Me_2CH.CH_2$-CHO. A liquid, d.0.8041, b.92, soluble in alcohol or ether, slightly soluble in water.

valeramide. $C_5H_{11}ON$ = 101.1. Valeric amide, pentanamide*, $Me(CH_2)_3CO.NH_2$. Colorless crystals, m.127, b.231, soluble in water, ether or alcohol.

valerate. Valerianate. A salt of valeric acid, $C_4H_9.COOM$.

valerene. Amylene.

valerian. The dried rhizome of *Valeriana officinalis*, Valerianaceae. It contains valerian, an essential oil, the bornyl ester of *iso*-valeric and other fatty acids; is used medicinally, as the fluid extract, as a nervine, an antispasmodic and stimulant. **American-** Cypripedium. **Japanese-** Kesso oil.

v. oil. The volatile oil of v., a greenish liquid, d.0.990–0.996, b.250–300, containing borneol, bornyl formate, b. acetate, pinene and camphene.

valerianate. Valerate.

valerianic acid. Valeric acid.

valeric acid. $C_5H_{10}O_2$ = 102.1. Valerianic acid, pentanoic acid*. A group of isomeric, fatty acids in valerian: *normal-* $MeCH_2.CH_2.CH_2$-$COOH$; *iso-*, *common-* or isopropylacetic acid, $Me_2CH.CH_2.COOH$; *dl-*, *dextro-* or *levo-* $MeCH_2$-$CHMe.COOH$; trimethyl acetic acid (q.v.), $CMe_3.COOH$. **normal-** A liquid, m. −19, b.185, d_{20}°941. **common-** Isopropylacetic acid. Pentoic acid. A colorless liquid, d.0.942, m. −51, b.186; soluble in water, alcohol or ether. It occurs in the essential oil of valerian; used in perfumery and the manufacture of fruit ethers. **dl-** Methylethylacetic acid, $EtCHMeCOOH$. A colorless liquid, d.0.941, m. −80, b.177, soluble in water. **amino-** See *valine, norvaline homopiperidic acid.* **aminoguanido-** Arginine **aminomethyl-** See *leucine, isoleucine.* **diamino-** Ornithine. **keto-** Levulinic acid. **methyl-** Isocaproic acid. **tetrahydroxy-** Arabic acid.

v. aldehyde. Valeraldehyde. **v. anhydride.** $C_{10}H_{18}O_3$ = 186.2. Pentanoic anhydride*. The anhydride of valeric acid $(C_4H_9CO)_2O$. A colorless liquid, d_{27}°0.929, b.205, decomp. by water to valeric acid.

valeridin. $C_{13}H_{19}O_2N$ = 221.2. Valeryl-p-aminophenetol, valerylphenetidine, sedatin, valerydin, $EtO.C_6H_4.NH.OC.C_4H_9$. Colorless needles; insoluble in water, soluble in alcohol or ether; used medicinally as a nervine and a sedative.

Valerius Cordus. 1510–1544. A German physician noted as the writer of the first legal pharmacopoeia: *Dispensatorium pharmacorum omnium*, 1535.

valerol. $C_{15}H_{20}O_3$ = 284.2. A ketone obtained from the oil of valerian.

valerolactone. $C_5H_8O_2$ = 100.06. $MeCH.(CH_2)_2CO.O$. A colorless liquid, b.220, in wood tar.

valerone. Diisobutylketone.

valeronitrile. Butyl cyanide.

valerydin. Valeridin.

valeryl. Pentanoyl*. The monovalent radical, C_4H_9CO—, derived from valeric acid. **v. chloride.** C_5H_9OCl = 120.53. Isovaleryl chloride, pentanoylchloride*, $Me_2.CH.CH_2COCl$. A colorless liquid, d.0.989, b.114; decomp. by water. **v. diethylamide.** Valyl (2). **v. oxybutyrine.** Quietol. **v. phenetidine.** Valeridin.

valerylene. C_5H_8 = 68.1. Pentylene, *2*-pentyne*, methylethylacethylene. An unsaturated hydrocarbon of the acetylene series, $MeC{:}CEt$. It is an isomer of pentinene, $Me_2C{:}C{:}CH_2$.

validol. $C_{15}H_{28}O$ = 236.2. Menthol valerate. A colorless liquid; insoluble in water, soluble in alcohol or ether; used medicinally as a nerve sedative and stomachic.

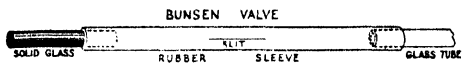
valine. $C_5H_{11}O_2N$ = 117.1. Aminoisovaleric acid, *2*-amino-*3*-methylbutanoic acid*, $Me_2CH.CHNH_2.COOH$. An amino acid from seeds and proteins. It occurs in two steroisomeric forms, dextro- and levo-rotatory compounds. **iso-** See *isovaline.* **nor-** See *norvaline.*

Vallets mass. Ferrous carbonate mass.

valonia. The acorn cups of *Quercus aegilops*, a Fagaceae of Greece and Asia Minor; used for tanning.

value. A number expressing a property; as, acetylation v., acid v., heat v., iodine v., saponification v.

valve. A device for controlling the motion of a fluid along a passage. It may be so arranged as to close or open an outlet by means of the pressure of the fluid flowing in a particular direction with a definite force. **Bunsen-** A piece of rubber tubing with a short slit in the side. A piece of glass rod is inserted in the rubber tube which is fitted to an exit tube, so that steam or air can escape but cannot re-enter.



Contat-Göckel- A chemical v. used in the cooling of acid solutions (*e.g.*, of iron), which are easily oxidized when hot. A solution of sodium bicarbonate is drawn into the flask containing the acids, as it cools, and the CO_2 evolved prevents the entry of an excess of alkali. **Fleming-** See *Fleming tube.* **radio-** See *rectifier, vacuum tubes.*

v. effect. Unilateral conductivity. The phenomenon, shown by cells composed of certain electrodes and electrolytes, of conducting a current in one direction only. Such cells can be used as rectifiers.

valyl. (1) $C_9H_{19}ON$ = 157.2. Valeric acid diethylamide, valeryldiethylamide, $MeCH_2CH_2$-CH_2CONEt_2. A colorless liquid, slightly soluble in water, soluble in alcohol or ether; used medicinally as a sedative and antispasmodic. (2) The monovalent radical, $Me_2CH.CHNH_2$-CO—, derived from valine.

valzin. Sucrol.

vanadate. A salt of vanadic acid of the general type, M_3VO_4. **meta-** A salt of the type, MVO_3. **ortho-** Vanadate, M_3VO_4. **pyro-** A salt of the type, $M_4V_2O_7$.

vanadic. Describing a compound containing tri- or pentavalent vanadium; as, VCl_3 or V_2O_5. **v. acid.** HVO_3 = 100.0. *meta-* Golden-yellow scales, slightly soluble in water, soluble in alcohol or ether; used as an oxidizing agent, and medicinally, as an antiseptic. *ortho-* H_3VO_4 = 118.0. A yellow powder, slightly soluble in water. *pyro-* $H_4V_2O_7$ = 218.0. An amorphous, brown powder; slightly soluble in water, soluble in alcohol or ether. **v. anhydride.** Vanadium pentoxide. **v. salts.** See *vanadium.*

vanadinite $PbCl_2.3Pb_3(VO_4)_2$. A native lead chloride and lead vanadate.

vanadite. (1) A salt of the type of $M_2V_4O_9$ from vanadous acid. (2) Vanadinite.

vanadium. V = 50.95. A rare metal and element, atomic number 23, discovered in 1830 by Sefström. It occurs in the blood of ascidians. It is a light gray metal, d.5.69, m.1720, insoluble in water or alcohol, soluble in acids. Vanadium has valencies of, 2, 3, 4, and 5, and forms, accordingly, several series of compounds. It is distinctly amphoteric, giving basic salts (vanadyl compounds) and acid salts (vanadates). These ions impart various colors to its solutions:

valence number	ion	name	color
2.....	V^{++}	vanadous.....	violet
3.....	V^{+++}	vanadic.....	green
	VO^{+}	vanadyl (ous)....	bluish-gray
5.....	VO_4^{---}	ortho vanadate..	yellow
	VO_3^{-}	meta vanadate...	yellow
	VO^{+++}	vanadyl (ic).....	blue

Vanadium is used in metallurgy, (*e.g.*, as ferrovanadium in the manufacture of steel), and in the preparation of catalysts. It resembles tantalum, and can be cold-worked into wire. The world output in 1940 was 3,500 long tons, from Peru > U. S. > Southwest Africa > Northern Rhodesia.

v. bromide. VBr_3 = 290.71. A dark green amorphous powder, which readily dissolves and decomp. in water. **v. carbides:** (1) VC = 62.96. A black crystalline mass, d.5.36, m.2830; insoluble in acids, except nitric acid. (2) V_4C_3 = 239.84. **v. chlorides:** three chlorides: (1) VCl_2 = 121.9. V. dichloride, vanadous chloride. Violet hexagonal crystals, d.3.28; soluble in water or alcohol. (2) VCl_3 = 157.4. Vanadic chloride, v. trichloride. A green, crystalline powder, d.3.0, soluble in water or alcohol. (3) VCl_4 = 192.8. V. tetrachloride. A red liquid, d.1.865, m. −15, b.154; soluble in water, alcohol or ether. **v. dichloride.** See *v. chloride* (1). **v. difluoride.** See *v. fluoride* (1). **v. dioxide.** (1) V_2O_2 = 134.0. A light-gray, crystalline powder, d.3.64, insoluble in water, alcohol or ether, soluble in acids or alkalis, producing a lavender-blue solution which has strong reducing powers. Cf. *v. monoxide.* (2) VO_2. See *v. tetroxide.* **v. dioxymonochloride.** Vanadyl chloride. **v. disulfide.** V_2S_2 = 166.05. A black powder, d.4.2; insoluble in hydrochloric acid, soluble in sulfuric acid. **v. fluorides:** (1) VF_2 = 89.0. Vanadous fluoride, v. difluoride. Insoluble, except in HF. (2) VF_3 = 107.96. Vanadic fluoride, v. trifluoride. A green crystalline powder, d.3.363, m. about 800, insoluble in water. (3) $VF_3.3H_2O$ = 162.01. Rhombohedral crystals, readily soluble in water. (4) VF_4 = 126.96. V. tetrafluoride. A yellow, hygroscopic crystalline powder, d.2.975, decomp. 325; soluble in water or acetone. (5) VF_5 = 145.96. V. pentafluoride. A liquid, d.2.177, b.111; soluble in water or alcohol. **v. hydroxides:** (1) $VO.xH_2O$, or $V(OH)_2$. Vanadous hydroxide. A violet-gray powder, insoluble in water or sodium hydroxide, soluble in acids. (2) $V_2O_3.xH_2O$ or $V(OH)_3$. Vanadic hydroxide. A green powder, insoluble in water, soluble in acids. **v. minerals.** Vanadium is widely diffused, and occurs in small quantities as a constituent of rocks, clays and coals.

vanadinite.....	$Pb_5V_3O_{12}Cl$
sulvanite.....	Cu_3VS_4
carnotite.....	Uranium vanadate
descloizite.....	$4(Pb, Zn)O.V_2O_5.H_2O$
patronite.....	V_2S_3

Cf. *roscoelite, volborthite.* **v. monosulfide.** VS. See *v. disulfide.* **v. nitride.** VN = 64.97. A solid, d.5.63, m.2050; insoluble in water, acids or alkalis. **v. oxides:** oxides:

VO or V_2O_2.....	v. monoxide, vanadous oxide
V_2O_2.....	v. dioxide
V_2O_3.....	v. trioxide, vanadic oxide, v. sesquioxide
V_2O_4 or VO_2.....	v. tetroxide
V_2O_5.....	v. pentoxide, vanadic anhydride

In addition there are the positive ions:

VO^{++}.....	vanadyl (ous) or vanadyl
VO^{+++}.....	vanadyl (ic) or pervanadyl
VO_2^{+}.....	vanadol

v. oxybromide. Vanadyl bromide (1). **v. oxychloride.** Vanadyl chloride (2). **v. oxydibromide.** Vanadyl bromide (2). **v. oxydichloride.** Vanadyl chloride (3). **v. oxydifluoride.** Vanadyl fluoride (1). **v. oxyfluoride.** Vanadyl fluoride (2). **v. oxytribromide.** Vanadyl bromide (3). **v. oxytrichloride.** Vanadyl chloride (4). **v. pentoxide.** V_2O_5 = 182.0. Vanadic oxide, vanadic anhydride. A yellowish or red crystalline powder, d.3.357, m.656, soluble in hot conc. acids; a strong oxidizing agent. **v. pentafluoride.** V. fluoride (5). **v. pentasulfide.** V_2S_5 = 264.2. Vanadic sulfide. A green powder, d.3.0; slightly soluble in alkalis, soluble in acids. **v. sesquioxide.** V. trioxide. **v. sesquisulfide.** V. trisulfide. **v. silicides:** (1) V_2Si = 129.98. Silver-white prisms, d.5.48; insoluble in water, acids or alkalis. (2) VSi_2 = 107.08. Metallic prisms, d.4.42; insoluble in water, alkalis or acids. **v. steel.** An alloy of iron and 0.1 to 0.15 % vanadium, used in the manufacture of tools. **v. sulfate.** Vanadyl sulfate. **v. sulfides:** V_2S_2, vanadium disulfide; V_2S_3 (vanadous) vanadium trisulfide; V_2S_5 (vanadic) vanadium pentasulfide. **v. tetrachloride.** V. chloride (3). **v. tetrafluoride.** V. fluoride (4). **v. tetroxide.** V_2O_4 = 165.9. Vanadous acid. An indigo-blue, crystalline powder, d.4.399, m. above 1750, insoluble in water, soluble in acids or alkalis. **v. trichloride.** See *v. chloride* (2). **v. trifluoride.** See *v. fluorides,* (2) and (3). **v. trioxide.** V_2O_3 = 149.92. V. sesquioxide, vanadous oxide. A black, infusible, crystalline powder, d.4.87, m.1970; slightly soluble in water, soluble in alkalis or halogen acids. It changes slowly in air to the indigo-blue oxide, V_2O_4; used as a mordant in dyeing, as a catalyst, and in the manufacture of steel and of silver vandate, Ag_3VO_4. **v. trisulfide.** V_2S_3 = 198.2. Vanadous sulfide. A dark-red, crystalline powder, d.3.85; insoluble in water, soluble in nitric acid or ammonium sulphate solution.

vanadol. The radical VO_2^{+}.

vanadous. Describing a compound containing di- or trivalent vanadium; as, VCl_2 or V_2O_3. **v. acid.** $H_2V_4O_9$. The hypothetical compound from which vanadites are derived, $M_2V_4O_9$. **v. chloride.** Vanadium chloride (1). **v. fluoride.** Vanadium fluoride (1). **v. hydroxide.** Vanadium hydroxide (1). **v. oxide.** Vanadium trioxide. **v. sulfide.** Vanadium trisulfide.

vanadyl. (1) The trivalent radical, VO≡ vanadyl(ic), derived from pentavalent vanadium, (vanadic). (2) The monovalent radical, VO— vanadyl(ous), derived from trivalent vanadium (vanadous). **di-** The tetravalent V_2O_2≡ radical. **v. bromides:** (1) VOBr = 146.87. V-ous bromide, vanadium oxybromide. A solid, d.4.00, decomp. 480, slightly soluble in water. (2) $VOBr_2$ = 226.79. V. dibromide, vanadium oxydibromide. A brown, hygroscopic powder, soluble in water. (3) $VOBr_3$ = 306.7. V. tribromide, v-ic bromide, vanadium oxytribromide. A red liquid, d.2.933, readily soluble in water (decomp.). **v. chlorides:** (1) V_2O_2Cl = 169.4. V. semichloride, vanadium dioxymonochloride. Yellow crystals, d.3.6, insoluble in water. (2) VOCl = 102.4. V. monochloride, v-ous chloride, vanadium oxymonochloride. A brown powder, d.2.8; insoluble in water, soluble in acids. (3) $VOCl_2$ = 137.8. V. dichloride, vanadium oxydichloride. Blue scales, d.2.88; deliquescent and slowly decomposed by water. (4) $VOCl_3$ = 173.3. V. trichloride, v-ic chloride, vanadium oxytrichloride. Dark green, syrupy liquid; d.1.836, m.−15, b.127; soluble in alcohol or water. It is used as a mordant in the dyeing industry. **v. dibromide.** See v. bromide 2. **v. dichloride.** See v. chlo- See v. bromide 2. **v. dichloride.** See v. chloride 3. **v. difluoride.** See v. fluoride 1. **v. fluoride** (1) VOF_2 = 104.96. V. difluoride, vanadium oxydifluoride. A solid, d.3.396, decomposed when heated; insoluble in water. (2) VOF_3 = 123.96. V. trifluoride, v-ic fluoride. A solid, d.2.459, m.300; very soluble in water. **v. monobromide.** V. bromide 1. **v. monochloride.** V. chloride 2. **v. semichloride.** V. chloride 1. **v. sulfate** $(VO)_2(SO_4)_3$ = 422.2. A blue, crystalline powder; soluble in water and decomposed by alcohol. *di-* $(V_2O_2)(SO_4)_2$ = 326.0. A double salt of v. sulfate. **v. tribromide.** V. bromide 3. **v. trichloride.** V. chloride 4. **v. trifluoride.** V. fluoride 2.

vanadylic. The trivalent radical, ≡VO. **v. bromide.** Vanadyl bromide 3. **v. chloride.** Vanadyl chloride 4.

vanadylous. The monovalent radical, —VO. **v. bromide.** Vanadyl bromide 1. **v. chloride.** Vanadyl chloride 2.

van der Waals, Johanns Diderik. Vander Waals. 1837–1923. A Dutch chemist noted for his contributions to physical chemistry. **van der W. constant.** The factors, *a* and *b*, in the equation of state (q.v.). **v. d. W. equation.** A modification of the equation of state in which two correcting factors are introduced: $(p + a/v^2)(v - b) = RT$, in which the volume factor, *b*, corresponds with four times the square root of the space occupied by the molecules themselves, and the factor, a/v^2, expresses the mutual attraction of the molecules for each other. See *corresponding states*. **v. d. W. forces.** The weak forces between atoms and molecules which cause crystallization of inert gases at low temperature, and the packing together of nonpolar organic compounds to form soft crystals of low melting point.

van Dyck brown. Vandyke. A mixture of ocher and lamp black.

van Helmont. See *Helmont*.

Vanier's tube. An absorption device consisting of a potash bulb and drying tube, used to absorb the CO_2 evolved in the determination of carbon in steel by the combustion method.

vanilla. Vanilla bean. The cured and full-grown, unripe fruit of *Vanilla planifolia*, an Orchidaceae. It contains vanillin and vanillic acid; used medicinally as an aromatic and in the manufacture of chocolate, confectionery, flavoring extracts and perfumery.

vanillal. The bivalent radical, (3,4)(MeO)(HO)-C_6H_3, CH=, derived from vanillin.

vanillic acid. $C_8H_8O_4$ = 168.1. 3-Methoxy-4-hydroxybenzoic acid, $MeO.C_6H_3(OH)COOH$. Colorless needles, m.207 (sublimes); slightly soluble in water, soluble in alcohol or ether. **v. alcohol.** $C_8H_{10}O_3$ = 154.1. 3-Methoxy-4-hydroxybenzyl alcohol, $MeO.C_6H_3.OH.CH_2OH$. Colorless needles, m.115, decomp. by further heat, soluble in water, alcohol or ether.

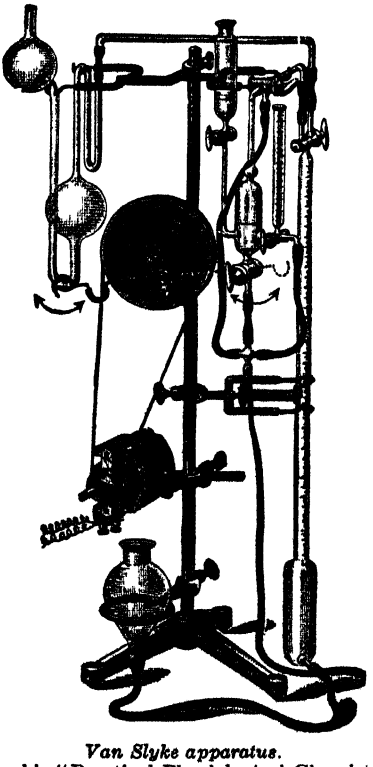
vanillin. $C_8H_8O_3$ = 152.1. Methylprotocatechuic aldehyde, 3-methoxy-4-hydroxy benzaldehyde, $MeO.C_6H_3(OH)CHO$. An odorous principle from the vanilla bean, or prepared synthetically. Colorless needles, m.80 (sublimes), slightly soluble in water, soluble in alcohol, ether or glycerol. Used as a reagent, and as a flavoring agent and vanilla substitute. **ethyl-** $C_9H_{10}O_3$ = 166.08. *m*-Ethoxy-*p*-hydroxy benzaldehyde, bourbonal. A homologue of vanillin, four times as strong in flavor. Cf. *ethyl vanillate*. **iso-** See *isovanillin*.

vanilloyl. The monovalent radical, (3,4)(MeO)-(HO)C_6H_3CO—, derived from vanillic acid.

vanillyl. The monovalent radical, (3,4)(MeO)-(HO)$C_6H_3CH_2$—, derived from vanillic alcohol. **v. alcohol.** Vanillic alcohol.

vanirom. Bourbonal.

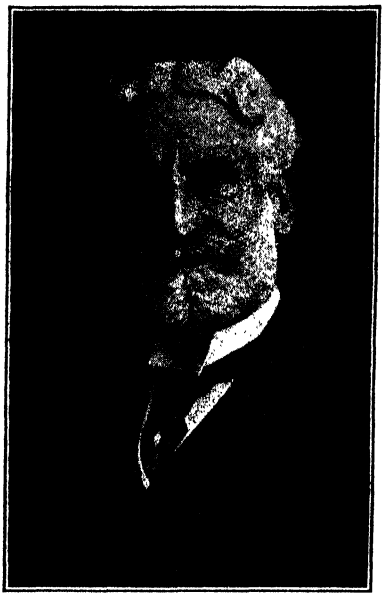
van Laar, J. J. 1860– . A Dutch chemist and coworker of van't Hoff and van der Waals.



Van Slyke apparatus.
(Hawk's "Practical Physiological Chemistry.")

vanning. The mechanical separation of the constituents of an ore by washing away the lighter portions in a stream of water.

Van Slyke, Donald Dexter. 1883– . An American chemist noted for his work on biochemical analysis. **V. S. apparatus.** A setup of chemical glassware for the determination of aliphatic amino-nitrogen in proteins. **V. S. method.** The measurement of the nitrogen gas evolved from aromatic amino compounds and nitrous acid: $R.NH_2 + HNO_2 \rightarrow R.OH + N_2 + H_2O$. It is used in biochemical analysis for the determination of proteins.



Lucius Lincoln Van Slyke.

Van Slyke, Lucius Lincoln. 1859–1931. An American chemist noted for research in the chemistry of dairy products.

van't Hoff, Jacobus Henricus. 1852–1911. A Dutch chemist noted for his work on stereochemistry and the theory of solutions. Nobel Prize winner in 1901. **v. H.'s factor.** The empirical factor, i, in the equation of state when applied to solutions: $pv = iRT$, where p is the osmotic pressure and v the volume. The factor i depends on the dissociation of the compound; if the molecules are completely ionized, i is 2 for binary and 3 for ternary compounds. If d is the degree of ionization and n the number of ions into which a molecule is partly dissociated, $i = 1 + d(n - 1)$. **v. H.'s law.** The osmotic pressure exerted by a solute in solution is the same as it would be for the same solute in the state of an ideal gas occupying the same volume as was occupied by the solution. **v. H. solution.** A solution of 2 gm. $CaCl_2$, 2.2 gm. KCl, 7.8 gm. $MgCl_2$, 3.8 gm. $MgSO_4$ and 100.2 gm. NaCl in 1000 cc. water. **v. H. theory.** Dissolved substances obey the gas laws.

Jacobus Henricus van't Hoff.

(From Brownlee, Fuller and Hancock "Elementary Chemistry." Courtesy of Allyn & Bacon.)

vanthoffite. $MgSO_4.3Na_2SO_4$, a Stassfurt salt.

vapodust. An insecticide spray consisting of vaporized petroleum oils; used, in the form of a fog, in orchards.

vapor, vapour. A gas, especially the gaseous form of a substance that at ordinary temperature is a solid or liquid; as, iodine-v., ether-v. It is the state or phase into which a substance passes when its v. pressure equals that of the atmosphere. **saturated-** A vapor is saturated when liquid in it and from which it is derived cannot further evaporate; that is, the same number of molecules which escape from the liquid into the gas, are condensed from the gas to the liquid, and an equilibrium is set up dependent on temperature only. **unsaturated-** A vapor contained in a space in which there is insufficient liquid to saturate it.

v. bath. Steam bath. **v. density.** The density of a gas compared with some gas as a standard. Three standards:

(a) hydrogen, as 1..... $D_{(H_2=1)}$
(b) oxygen, as 16..... $D_{(O_2=16)}$
(c) air, as 1..... $D_{(air=1)}$

The relationship of these three standards is: $a = M/2$; $b = M$; and $c = M/28.95$; where M is the molecular weight of the substance, the data being corrected for pressure and temperature by the equation of state, q.v. **v. pressure.** The pressure at which a liquid and its vapor are in equilibrium at a definite temperature. If the v.p. reaches the prevailing atmospheric pressure (1 atm.) the liquid boils (boiling point). Cf. *Babo's law, Clausius equation, Wullner's law.* **v. tension.** The tendency of a liquid to form a vapor. It is assumed that the molecules of a liquid are in motion; those moving fastest are expelled from the liquid and become molecules of gas, and vice versa, thus, establishing an equilibrium between the number of molecules in the gas and in the liquid which depends upon the prevailing temperature and pressure.

vaporimeter. An instrument in which the volatility of lubricating or other oils is tested by heating them in a current of air.

vaporization. Volatilization. The change from the liquid to the gaseous state without any change in the chemical composition of the molecule. Cf. *evaporation.* **heat of-** The number of calories required to transform one gram of liquid substance, at its boiling point, into its vapor. Cf. *Clausius equation.*

vaporize. (1) To change into a vapor, *e.g.*, by heating a liquid. (2) To atomize, or subdivide a liquid into a fine spray.

vaporizer. (1) An atomizer. (2) A still.

varek. A French term for kelp.

variability. The deviation from the normal or standard. Cf. *variance*.

variable. A factor that is not constant, but changeable.

variance. Degree of freedom. The number of external conditions which may be arbitrarily fixed; as, composition, temperature, and pressure. See *phase rule, freedom, variability*.

variant. Pertaining to variable factors. di- An area in a diagram, q.v. **mono-** A line in a diagram. **non-** A point in a diagram. Cf. *phase rule*.

variscite. $AlPO_4.2H_2O$. Peganite. A green aluminum phosphate, sometimes used as a gem.

varnish. A solution of a resin or drying oil in a volatile solvent (*e.g.*, alcohol or turpentine). See *lacquer*.

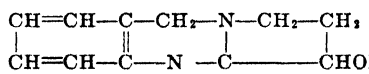
Varrentrapp, Franz. 1815–1877. A German chemist, noted for analytical methods.

varve. A lamination in a deposit of natural clay.

vasculose. An early name for impure lignin; m.211, (decomp.), slightly soluble in water, soluble in alcohol or chloroform.

vaselin. Fossolin. A mixture of hydrocarbons of the paraffin series obtained from the residues of petroleum. See *petrolatum*.

vasicine. $C_{11}H_{12}N_2O$ = 188.11. An alkaloid from *Peganum harmale* or *Adhatoda vasica*, an Acanthaceae, white needles, decomp. 198; used as an insecticide.



vasoconstrictor. A vasomotor stimulant or agent that increases arterial pressure by the constriction of the blood vessels; as, epinephrine, ergot, cocaine, tyramine, and:

	R	*R'*	*3*	*4*
ephedrine	CH_3	CH_3	H	H
synephrine	H	CH_3	H	OH
neosynephrine	H	CH_3	OH	H
epinephrine	H	CH_3	OH	OH
cobefrine	CH_3	H	OH	OH

vasodilator. A vasomotor depressant, or agent that lowers the arterial pressure by the dilation of the blood vessels; as, amyl nitrite, nitroglycerin, veratrum, aconitine.

vasopressin. β-Hypophamine.

vat. (1) A vessel or tub in which colors are dissolved or ores are washed and subjected to chemical treatment; as, indigo-vat or cyanide-vat. (2) The solutions used in these tubs; *e.g.*, zinc-lime vat (10 pts. indigo, 10 pts. zinc dust, 30 pts. lime); sulfate-vat (10 pts. indigo, 50 pts. ferrous sulfate, 60 pts. lime). **v. dye.** A color that is applied with a mordant. See *dyes*.

vaterite. μ-$CaCO_3$. A probable anisotrope of calcite, d.1.254.

Vaughan's cage. An iron-screen box that is collapsible and can be sterilized; used in animal experiments.

Vauquelin, Louis Nicolas. 1763–1829. A French chemist, the discoverer of chromium and organic compounds, and a pioneer in teaching laboratory work.

vauqueline. Strychnine.

vauquelinite. $2PbO.CuO.2CrO_3$. A native mixed oxide of lead, copper and chromium.

vector. A magnitude (such as velocity, force, momentum, induction etc.) which has both, magnitude and direction, and which may be represented as a straight line of suitable length and direction. Cf. *co-ordinates, scalar, molecular diagram*.

veepa oil. Margosa oil.

vegetable. Pertaining to plants, q.v. **v. dyes.** Coloring materials obtained from plants; as, chromoproteins, indicators, cyanins, carotenes, plant pigments. **v. horsehair.** See *horsehair*. **v. parchment.** An imitation parchment used widely for wrapping foodstuffs, and prepared by passing paper through a bath containing sulfuric acid or a solution of zinc chloride. **v. potash.** A fertilizer made from distillery waste (33 % K_2O).

vehicle. A usually-inactive substance serving as a medium or carrier for an active substance; as oil in paints (cf. *thinner*).

vein. (1) A blood-vessel that conveys blood towards the heart. (2) A lode or deposit of ores distinct from the surrounding rocks.

vellosine. $C_{22}H_{28}O_4N_2$ = 396.3. An alkaloid from the bark of *Geissospermum vellosii*, or pareira bark. Pale yellow crystals, m.189, insoluble in water, soluble in alcohol or ether.

velocity. (1) The speed with which an object travels, expressed as the distance covered by it during a certain unit interval of time: v = L/T. (2) The time required for a phenomenon to take place; as, v. of reaction. Cf. table, for magnitudes of velocity. **angular-** q.v. **migration-** q.v. **molecular-** q.v. **reaction-** q.v. **terminal-** The velocity acquired by a freely-falling body when the resistance of the medium through which it falls balances the weight of the particle.

v. constant. The constant of the velocity of reaction (q.v.).

MAGNITUDES OF VELOCITY

Light	186,000	miles per sec.	2.99×10^{10} cm./sec.
Electrons in cathode rays			10^9 to 10^{10} "
Alpha-particles, initial velocity	20,000	miles per sec.	3.2×10^9 "
Farthest spiral nebula (recession)	12,300	"	2×10^9
Sun, around hub of Milky Way	200	"	3×10^7 "
Mercury around sun	29.7	"	4.78×10^6 "
Earth around sun	18.33	"	2.95×10^6 "
Neptune around sun	3.37	"	5.43×10^5 "
Sound in iron	3.1	"	5×10^5 "
Hydrogen molecules at 0°C.	1.11	"	1.8×10^5 "
Sound in water	0.9	"	1.46×10^5 "
Rifle bullet in air	1,970	ft. per sec.	6×10^4
Nitrogen molecules at 0°C.	1,630	"	4.97×10^4 "
Earth rotation at equator	1,525	"	4.65×10^4 "
Oxygen molecules at 0°C.	1,525	"	4.65×10^4
Sound in air	1,089	"	3.32×10^4

Moon around earth	534	".....	1.63×10^4 cm./sec
Speed car on racing beach	370	".....	1.14×10^4 "
Wind at 100 miles p. hr.	150	".....	4.57×10^3 "
Nerve impulse	128	".....	3.9×10^3 "
60 miles per hour	88	".....	2.66×10^3 "
20 miles per hour	29.2	".....	9×10^3 "
Paper-making machine	16.6	".....	5×10^3 "
1 centimeter per second		.....	1 "
Crystal growth (picric acid)	14.3	mm. per sec.	1.43 "
Gas diffusion (H into O)	6.9	".....	0.69 "
Fastest plant growth	0.03	".....	3×10^{-3} "
Crystal growth (o-phosphoric acid)	0.018	".....	1.8×10^{-3} "
Growth of beard	0.00001	mm. per sec.	1×10^{-6} "
Growth of eucalyptus tree	10	feet per year	1×10^{-8} "
Diffusion of gold into lead	0.002	mm. per day	4.6×10^{-9} "

velon. Trade name for a vinylidene chloride plastic.

velox. Trade name for photographic printing paper.

Venetian red. A form of ferric oxide, Fe_2O_3, used as a pigment. **V. white.** A mixture of equal parts of lead white and barium sulfate; used as a pigment.

venom. The poison secreted by reptiles, amphibians, spiders and insects; as, snake v., scorpion v., toad v.

vent. An outlet for fumes or gases.

ventriculin. A dry granular powder extracted from desiccated and defatted hog stomach; used in pernicious anemia.

Venturi meter. Undermeter. A pipeline meter for measuring the quantity of liquid flowing past a certain point. A stream-line or constriction is used, the pressure across which shows the velocity of flow.

venus crystals. Copper acetate.

veratral. The bivalent radical, $(3,4)(MeO)_2$-C_6H_3CH=.

veratraldehyde. $C_9H_{10}O_3$ = 166.2. 3.4-Dimethoxybenzaldehyde, *3.4*-dimethoxybenzenecarbonal,* $(MeO)_2C_6H_3.CHO$. White needles, m.-43, b.283. **o-** 2.3-Dimethoxybenzaldehyde.

veratric acid. $C_9H_{10}O_4$ = 182.2. Dimethoxybenzoic acid, 3-methoxyanisic acid, 3,4-$(MeO)_2$-$C_6H_3.COOH$. An acid in sabadilla; m.181. **o-** 2.3-Dimethoxybenzoic acid. **formyl-** Opianic acid.

veratrin. A mixture of the alkaloids of veratrum: veratrine, (amorphous and crystalline), sabadine, sabadinine, jervine and other alkaloids. Used medicinally as a cardiac sedative and motor depressant. **amorphous-** Veratroidine. **crystalline-** Veratrine. **proto-** See *protoveratrine.*

veratrine. $C_{32}H_{49}O_9N$ = 591.5. Cevadine, cryst. veratrine. The chief alkaloid of veratrum. Colorless crystals, m.205, insoluble in water, soluble in alcohol or ether. Used medicinally, and externally in ointments. **proto-** See *protoveratrine.*

v. hydrochloride. $C_{32}H_{49}O_9N.HCl$ = 627.9. A colorless, amorphous powder; soluble in water or alcohol. **v. nitrate.** $C_{32}H_{49}O_9N.HNO_3$ = 654.5. A colorless, crystalline powder; soluble in water or alcohol. **v. sulfate.** $(C_{32}H_{49}NO_9)_2$-H_2SO_4 = 1280.80. An amorphous brittle mass, soluble in water.

veratroidine. $C_{37}H_{53}O_{11}N$ = 698.43. Amorphous veratrine. An alkaloid from veratrum. It hydrolyzes when heated with potassium hydroxide into cevine, $C_{27}H_{43}O_8N$, and 2 molecules of tiglic acid, $C_5H_8O_2$; veratrine gives only one molecule of tiglic acid.

veratrole. $C_8H_{10}O_2$ = 138.1. Dimethoxypyrocatechol, dimethoxybenzene,* methoxyanisole, $C_6H_4(OMe)_2$. Colorless crystals, d.1.086, m.23, b.205; slightly soluble in water, soluble in alcohol or ether. Used medicinally as an antiseptic and anodyne. **allyl-** Methyleugenol.

veratroyl. The monovalent radical, $(3,4)(MeO)_2$-C_6H_3CO— from veratric acid.

veratrum. American hellebore, green or false hellebore, Indian poke. The dried rhizomes and roots of *V. viride*, a Liliaceae. It contains the alkaloids veratrine, protoveratrine, rubijervine, pseudojervine, veratravine and veratroidine; used medicinally as a cardiac depressant and diaphoretic.

veratryl. The monovalent radical $(3,4)(MeO)_2$-$C_6H_3CH_2$— from veratryl alcohol.

verbascum. Mullein leaves. The dried flowers and herbs of *V. thapsus*, a Scrophulariaceae. It contains an essential oil, tannin, and resin; used medicinally, as the fluid extract, as a demulcent and anodyne. Cf. *mullein.*

verbena. Blue vervain, wild hyssop. The dried overground portions of *V. hastata* Verbenaceae. It contains a tannin and bitter principle; used medicinally, as the fluid extract, as a tonic and diaphoretic. **v. oil.** The volatile oil from the leaves of *V. triphylla* of France and Spain, containing about 30 % citral. Cf. *lippianol, andropogon oil. East Indian-* Lemongrass oil. *Singapore-* Citronella oil.

Verbenaceae. The vervain family. A group of herbs and shrubs, some of which contain aromatic principles.

Verbena hastata.....	verbena
Verbena urticaefolia..	white vervain
Verbena triphyllis....	verbena oil
Verbena officinalis....	verbenaloside
Lantana brasiliensis..	lantanine, yerba sagrada
Lippia dulcis.....	lippia
Premna taitensis.....	tonga bark

verbenalin. Verbenaloside.

verbenaloside. $C_{17}H_{28}O_{10}$ = 389.19. Verbenalin. A crystalline, reducing glucoside from the flowering tops of *Verbena officinalis*, wild verbena; m.181, soluble in water.

Verdet's constant. The magnetic rotation (R) of polarized light per cm., per unit magnetic field. $R = \alpha/H.l.$ where α is the rotation in minutes for the substance in a magnetic field of H gauss, and l, the length of the light path parallel to the lines of force. Films of Fe, Co and Ni are exceptions to this rule. **V.'s equation.** An equation indicating the magneto-optic rotation: $\theta = clH\left(r - \lambda\frac{dr}{d\lambda}\right)\frac{r^2}{\lambda^2}$, where c is a constant depending on the substance, l is the length of the path of the polarized beam, H is the intensity of the magnetic fields, r is the index of refraction of the substance, and λ the wave-length of the light used.

verdigris. Basic cupric acetate. It varies from blue to green, and is used as a pigment. **blue-** Cupric acetate.

verditer. Copper carbonate. **blue-** Blue copper carbonate. **green-** Green copper carbonate.

verdoflavin. A green reduction-product of riboflavin.

verine. $C_{28}H_{45}O_8N$ = 523.5. An alkaloid from sabadilla.

verium. Ve = 224(?). A supposed rare alkali metal, atomic number 87. A liquid like mercury d.2.5(?), m.17(?), b.610(?). It is the most electropositive metal, is not radioactive, has no visible spectrum. It is precipitated by silicotungstic acid and occurs in a few clays and alkali deposits of the Western U.S., in some springs, and in the ocean. Cf. *virginium*. **v. silicotungstate.** White, long, rhomboidal prisms, insoluble in water.

vermicide. An agent that destroys intestinal parasites. Cf. *vermifuge, teniacide*.

vermiculite. The gold-colored mineral $3MgO\cdot(FeAl)_2O_3\cdot 3SiO_2$; it expands on ignition.

vermiform. Describing a bacterial growth that resembles a mass of worms in appearance.

vermifuge. An agent that expels intestinal parasites; especially worms. Cf. *vermicide, teniafuge*.

vermilion. Red mercuric sulfide, cinnabar; used as a pigment and as a polishing material for lenses. Commercial grades may contain red lead and insoluble synthetic dyes. **mock-** Lead chromate.

vermilionette. A substitute for vermilion; usually chalk etc. dyed with a coal tar dye.

vermuth. A cordial prepared from white wine flavored with wormwood. Cf. *absinthe*.

vernalization. The process of bringing plants artificially to the spring state, by subjecting them to indoor temperature before planting. Cf. *auxin, plant hormone*.

vernier. A small movable auxiliary scale attached to a larger scale, by means of which more accurate readings can be taken.

vernine. $C_{16}H_{20}O_8N_8.3H_2O$ = 506.3. An alkaloid from ergot and leguminous seedlings; as, clover or vetches.

vernonine. $C_{16}H_{24}O_7$ = 256.2. A glucoside obtained from the batiator root, the root of *Vernonia nigritiana*, a Compositae of Africa. A hygroscopic white powder, soluble in water; it acts like digitalis, as a cardiac poison.

veronal. Barbital.

veronica. Speedwell. The dried herb of *V. officinalis*, a Scrophulariaceae. It contains an essential oil, tannin and a bitter principle; used medicinally as an alterative and tonic.

verrucose. Describing a growth of bacteria that resembles warts.

verticillic acid. $C_{26}H_{32}O_{11}.(H_2O)$ = 538.4. An acid produced by the mould fungi, *Penicillium Charlesii*.

vertivert oil. The volatile oil of *Andropogon muricatus*, d.1.015–1.030, soluble in water. Cf. *citronella oil, verbena oil*.

vervain. Verbena.

vesicant. An agent that causes blistering of the skin; as mustard gas, cantharides, croton oil. Cf. *pustulant*. **v. gases.** A group of poison gases (q.v.) used in warfare.

vesicle. A small blister.

vesipyrin. Spiroform.

vesorcinol. Dihydroxy toluene.

vesotinic acid. Hydroxy toluic acid.

vessel. (1) A container; as, a flask or beaker. (2) In biology, a canal or tube for carrying a fluid such as, blood or plant saps.

vesuvianite. Iodocrase.

vesuvin. Triaminoazobenzene.

vesypin. Spiroform.

vetiveria. Cuscus, khus-khus. The Indo-Malayan grass *V. zizanioides*, a Graminaceae, whose roots are woven into fragrant mats, fans, baskets, etc. **v. oil.** Oil of cuscus. A volatile oil distilled from v. Cf. *verbena oil*.

vial. Phial. A small bottle. Cf. *ampoule*.

vibracone. A vibrating ore screen; the ore is fed on to a vibrating conical surface.

vibration. A rapid to-and-fro motion, or oscillation. **atomic-** The motion of the atoms of a molecule. Cf. *porphin ring*. **electronic-** The conception of the dynamic atom, in which the electrons are in rapid vibration, causing the emission of rays. Cf. *spinning* electron.

vibrator. A device that produces mechanical vibration, as screens or shaking devices.

vibrograph. An instrument for measuring short time-intervals. It consists of a rotating drum, on which an electrically-driven tuning-fork records the time.

Viburnum. A genus of trees and shrubs of the caprifoliaceous family. **V. opulus.** Cramp bark. Cranberry tree, Guelder-rose. The dried bark of *V. opulus*, a Caprifoliaceae. It contains viburnin, valeric acid, sugar and tannins; used medicinally as the fluid extract, as a uterine antispasmodic and tonic. **V. prunifolium.** Black haw. The dried bark of *V. prunifolium*, a Caprifoliaceae. It contains viburnin, valerates, citrates, malates and tannin; used medicinally as a uterine sedative and tonic.

vicianin. A glucoside from the seeds of vetch, *Vicia sativa*.

vicianose. $C_{11}H_{20}O_{10}$ = 312.15. A disaccharide (glucose and arabinose) obtained by hydrolysis of vicianin.

vicilin. A globulin from peas, beans and lentils.

vicinal. The neighboring position of radicals, as in the 1.2.3- or 1.2.3.4- positions of the benzene or naphthalene rings, respectively.

victor bronze. An alloy of 58.5 parts copper, 38.5 parts zinc, 1.5 parts aluminum, 1 part iron and 0.03 part vanadium.

victoria blue. $C_{33}H_{31}N_3.HCl$ = 505.75. Phenyltetramethyltriamido-α-naphthyldiphenylcarbinol hydrochloride. A bronze colored, crystalline powder, soluble in hot water, alcohol or ether. Used in the textile industry for dyeing silk, wool and cotton. **v. green.** Malachite green. **v. orange.** $C_7H_5O_5N_2K$ = 236.3. Aniline orange, potassium dinitro-o-cresol. A reddish-yellow powder, used in dyeing wool and silk. **v. yellow.** Antinnonin.

victorium. Vi = 117, or monium, Mo. A supposed metallic element discovered by Sir William Crookes in 1898 in yttria minerals, which proved later to be a mixture of rare earths.

vienna caustic. Potassium hydroxide mixed with lime.

Vierordt, Carl. 1818–1884. A German physician and founder of quantitative spectrum analysis.

viferral. Hydronal.

Villavecchia test. A test for sesame oil, in which the sample (5 cc.) is shaken with 5 cc. of fuming hydrochloric acid and not more than 2 drops of a 1 % solution of furfural in alcohol (Baudouin's reagent). On standing the bottom (acid) layer becomes rose-colored if sesame oil is present.

villose. Describing a bacterial growth with hair-like flimsy extensions.

vinaconic acid. $C_5H_6O_4$ = 130.05. Ethylenemalonic acid, *1.1*-cyclopropane dicarboxylic acid*. $CH_2.CH_2.C(COOH)_2$. White needles, m.175.

vinasse. Schlempe. The residue from the fermentation of molasses, or grapes; used as a fertilizer, or as a source of potassium salts.

vinegar. (1) A weak (=6 %) solution of acetic acid containing coloring matter and other substances (esters, mineral matter etc.), formed by the fermentation of alcoholic liquids such as cider, wine or other fruit juices, with an acetifying organism. Cf. *acetifier, acetimetry.* (2) Acetextracts, acetum. The strained liquid obtained by macerating a drug with dilute acetic acid; as, squill v. **artificial-** A substitute for vinegar containing acetic acid, which is not wholly the product of alcoholic and subsequent acetous fermentation. **distilled-** The product of distillation of vinegar as defined above. **imitation-** Artificial v. **malt-** Vinegar derived, without intermediate distillation, wholly from malted barley with or without addition of whole cereal grain, the starch of which has been saccharified by the diastase of malt. **spirit-** The product of a distilled alcoholic fluid. **wood-** Pyroligneous acid.

v. essence. A product made synthetically or by distillation of wood. It usually contains 12 % acetic acid, and is colored with an aniline dye or caramel. Cf. *spirit acid.*

vinetine. Oxyacanthine.

vinic acids. A group of organic compounds analogous to acid salts; as, $EtHSO_4$, (ethylsulfuric acid or sulfovinic acid). **v. ether.** (Ethyl) ether.

vinifera palm oil. Bamboo oil.

vinilite. Vinylite.

vinol. Vinyl alcohol.

vinometer. A hydrometer used for estimating the percentage of alcohol in wine.

vinopyrine. Phenetidine acid tartrate. A colorless crystalline powder, soluble in cold water, decomp. by hot water; used as an antipyretic.

vinum. The Latin term for wine.

vinyl. Ethenyl*. The monovalent radical, $-CH:CH_2$, derived from ethylene. (Cf. *polyvinyl, vinylene, vinylidene.*) **v. acetate.** The ester $CH_3COOCH:CH_2$. **v. acetic acid.** β-Butenic acid. **v. acetylene.** C_4H_4 = 52.05. Butone, monovinyl acetylene. $CH_2:CH.CH:CH$. A gas formed on passing acetylene into ammoniacal cuprous chloride solution; with HCl it forms chloroprene, a source of artificial rubber (see *elastomer*). **di-** See *divinyl acetylene.* **v. alcohol.** C_2H_4O = 44.0. Vinol, ethenol*. $CH_2:CH.OH$. An unsaturated alcohol. **v. amine.** $C_2H_3NH_2$ = 43.06. Ethenylamine*. A liquid, b.56. **v. benzene.** Styrolene. **v. bromide.** C_2H_3Br = 106.95. Ethenylbromide, bromoethene*, $CH_2:CHBr$. A colorless liquid, d.-1.517, $b._{750mm}16$, insoluble in water, soluble in alcohol or ether. **v. chloride.** C_2H_3Cl = 62.5. Chloroethylene, chloroethene*. A colorless gas, $d._{-13.8}0.97$, b. −13.9, soluble in alcohol or ether. **v. cyanide.** C_3H_3N = 53.03. Acrylonitrile, propenenitril*, $CH_2:CH.CN$. A colorless liquid, m. −82, b.78. **v. ether.** C_4H_6O = 70.1. V. oxide, ethenyloxyethene*. The unsaturated compound, $CH_2:CH.O.CH:CH_2$. A colorless liquid, b.39, insoluble in water, soluble in alcohol or ether. **v. ethylene.** Bivinyl. **v. imine.** Dimethylene imine. **v. iodide.** Iodoethylene. **v. ketone.** Pentadienone. **v. oxide.** Vinylether. **v. sulfide.** C_4H_6S = 86.13. Ethenylthioethene*. The uusaturated compound, $CH_2:CH.S.CH:CH_2$. A colorless, oily liquid, d.0.913, b.101, slightly soluble in water, soluble in alcohol or ether.

vinylene. The bivalent radical, $-CH:CH-$, derived from ethylene. (Cf. *vinyl, vinylidene.*) **v. chloride.** Ethylene dichloride.

vinylidene. The bivalent radical, $H_2C:C=$, derived from ethylene. Cf. *vinyl, vinylene.*

vinylites. A group of synthetic resins made by polymerization of vinyl compounds. **v. A.** A solid, colorless, thermoplastic resin softening at 40–60°C, soluble in ketones, esters and hydrocarbons. **v. 80.** A white powder, partly soluble in ketones. **v. N.** A 35 % solution in toluene. V. are used in the manufacture of dentures (Resovin) and phonograph records, and may be colored with dyes and pigments.

vinyon. A vinyl-type plastic (q.v.) product, having a low melting point and resembling nylon, q.v.

vioform. $C_9H_4N(OH)ICl$. Nioform, iodochlorohydroxyquinoline. A pale, greenish-yellow powder, m.177, insoluble in water, alcohol or ether; used as an iodine dusting powder.

Viola. A genus of plants of the *Violaceae*, the violet family, which includes violet and pansy*. Cf. *violine.*

V. odorata..... sweet violet
V. canina..... dog violet
V. tricolor..... pansy or heart's ease.

v. crystallina. A pure gentian violet, used to treat impetigo. **v. quercetrin.** Oxyritin.

violacein. An antibiotic substance produced by the bacterium *Bacillus violaceum.*

violanthrole. $C_{34}H_{16}O_2$ = 456.2. Dibenzanthrole. A nonacyclic diketone; a purple dye for vegetable fibres.

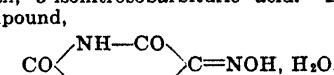
violaquercitrin. $C_{27}H_{30}O_{16}$ = 610.3. Osyritrin. A glucoside from various *Viola* species (pansies and violets); it hydrolyzes to glucose, quercitrin and isodulcitol.

violaxanthin. $C_{40}H_{56}O_4$ = 600.5. A carotenoid (q.v.), m.207, from the pigment of pansies, *Viola tricolor*, and the rind of oranges.

violet. (1) A species of plants of the Violaceae family. Cf. *Viola.* (2) A reddish-blue shade or pigment resembling the extreme blue end of the visible spectrum. **anthracene-** Gallein. **crystal-** Methyl v. **Döbner's-** Aminofuchsin iminochloride. A triphenyl methane dyestuff, used instead of fuchsin as a test for aldehydes. **essence of-** Orris. **ethyl-** See *ethyl v.* **gentian-** See *gentian violet.* **hexamethyl-** Methyl v. **Lauth's-** Thionine. **methyl-** See *methyl violet.* **ultra-** See *ultra-violet.*

violine. An alkaloid isolated from *Viola* species, and resembling emetine in action.

violuric acid. $C_4H_3O_4N_3$ = 157.09. 5-Oxime alloxan, 5-isonitrosobarbituric acid. The ring-compound,



soluble in alcohol, slightly soluble in water.

viosterol. Vitamin D.

Virginia snakeroot. Serpentaria.

virginium. Vi (or Vm). Ekacesium. Element No. 87 discovered by Allison and Murphy (1930) by the magneto-optic method. It is said to occur in minute traces in pollucite and lepidolite. Cf. *alabamine, verium.*

viridine. (1) $C_{12}H_{10}N$ = 177.2. A homolog of pyridine, distilled from coal tar and bone oil. (2) An alkaloid found in *Veratrum viride;* it resembles jervine.

viridinine. $C_8H_{12}N_2O_3$ = 184.1. A monoacid base obtained from putrid pancreas.

virulence. Extreme toxicity or poisonous effect.

virulent. Exceedingly poisonous or active in damaging protoplasm; as of bacteria.

virus. An animal poison that can transmit disease. An obligately-parasitic pathogen too small to be resolved by ordinary microscope methods. They are all chemically-similar nucleoproteins with varying P and carbohydrate contents, but they have widely different stabilities, properties and transmission characteristics.

viscamite. A vegetable glue used in the woodworking industry.

viscid. Sticky or gummy, glutinous.

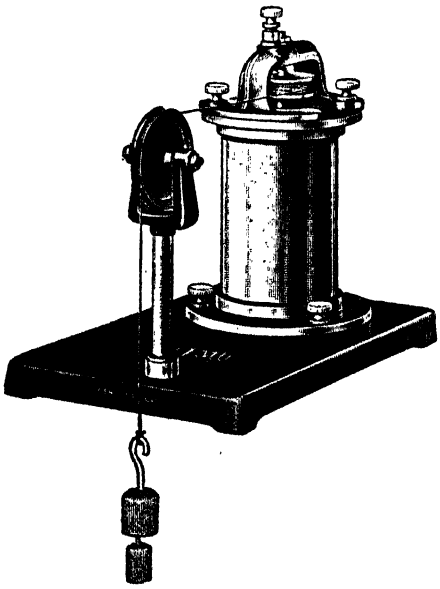
viscidity. Stickiness.

viscin. $C_{20}H_{48}O_6$ or $C_{20}H_{32}.8H_2O$ = 416.5. The glutinous constituent of the berries of the mistletoe; the chief constituent of bird lime. See *viscum.*

viscometer. Viscosimeter.

viscose. An extremely viscous syrup-like liquid obtained by treating cellulose with potassium hydroxide and carbon disulfide, from which acids precipitate cellulose. By pressing this liquid through fine openings into dilute acids the cellulose separates as fine, silky threads—viscose rayon, q.v. **v. silk.** See *rayon.*

viscosimeter. Viscometer. An instrument for determining the internal friction or fluidity of a liquid by measuring the number of revolutions



Torsion viscosimeter.

of a vane immersed in the liquid in comparison with its speed in water (cf. *consistometer);* or its rate of flow through an orifice (cf. *Engler*). **torsion-** A v. based on the force required to twist a cylinder immersed in the liquid through a certain angle.

viscosimetry. The methods of determining the fluidity of liquids.

viscosity. Internal fluid friction. The property of being glutinous or sticky, *i.e.,* offering a slight resistance to a change of form, caused by the molecular attraction between the molecules of a liquid. Poiseuille's formula for determining dynamic v. by the capillary tube method is: $v = \pi pr^4t/8lV$, poises where p is the pressure difference between the two ends of the tube, r the radius of the tube, l its length, and V the volume of liquid delivered in a time t. Antonym: fluidity. Cf. *poise, centipoise, Engler degree, Redwood, Saybolt seconds, Arrhenius, Einstein, Meyer's formula, softening.* **relative-** The v. of a liquid as compared with that of water at 20°C., *i.e.,* 1.005 centipoises. **Woolwich-** The time taken (secs.) for a steel ball 1/16 th. in. in diameter to fall 15 cms. through a solution at 20°C.

v. index. A value indicating the relation of the v. of a petroleum lubricating oil to its temperature: v.i. = $\left(\frac{L - U}{L - H}\right) \times 100$; where L and H are the viscosities at the low and high temperature, respectively. Cf. *S.A.E. number.*

viscum. Mistletoe. The leaves and branches of *V. flavescens,* a Loranthaceae. It contains viscin, bassorin, gum and tannin. Used medicinally as an antispasmodic and tonic.

visibility. The property of being able to be seen, or perceptible to sight. The visibility, K, of a particular wave-length of light is the ratio of luminous flux, F, to the radiant power producing it. **mean-** The average visibility, K_m, over any range of wave-lengths or the entire spectrum, K_m = (F)/(erg/sec.) where (F) is the total luminous flux in lumens and (erg/sec.), the total radiant energy in watts or erg/sec.

visible. Perceptible by the eye; as, v. light, v. spectrum.

vistanex. A synthetic fiber produced by spinning a viscous solution of polyisobutylene in n-hexane (cf. *vinyon*).

vitagen. A substance having vitamin (q.v.) activity, but also providing energy for life. *E.g.,* essential fatty acids, as linoleic, linolenic and arachidonic acids (vitamins F, F_1); carbohydrates (*e.g.,* inositol); amino acids (lysine, tryptophane, etc.); choline and its derivatives (*e.g.,* betaine, methionine); and sulfur organic compounds.

vitaglass. A colorless, transparent window glass which allows the passage of ultra-violet light.

vital. Pertaining to life.

vitamer. One of a group of substances capable of relieving a specific avitaminosis. *Ex.,* a D vitamer is one of the vitamins D.

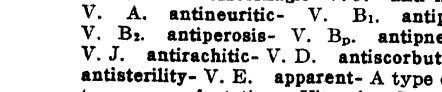
vitamin. Accessory (food) factor (Hopkins, 1906), vitamin "e" (essential to life, Funk 1912), advitant, exogenous hormone, food hormone, vitol, biosterin. An organic substance which is essential in small quantities for maintaining the life of an animal, but which cannot be synthesised by the animal, and does not itself provide energy; cf. *vitagen, vitazyme, vitasterol, biocatalyst.* Antonym toxamin. An absence or deficiency of one or more vitamins in a diet results in characteristic diseases or disorders (avitaminosis); an excess of some vitamins may also have ill-effects (hypovitaminosis). Vitamins have been classified according to their solubility or the effects they produce, and were known by letters. A number however, have now been synthesised, and the chemical structures of others are known; also, what were

formerly regarded as single vitamins are now known to consist of a "complex" of several vitamins, often having similar but different properties. The known vitamins and their commonest synonyms are (H. R. Rosenberg, *Chemistry and Physiology of Vitamins*, 1942):

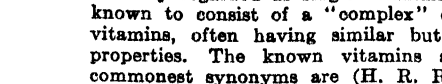
	Identified	Non-identified
Vitamins A...	A (axerophthol)	
	A_2	
	A_3 (?)	
Vitamin B complex	B_1 (thiamin)	B_3 (pantothenic acid?)
	B_2 (riboflavin)	B_4 (biotin, arginine and glycine?)
	B_6 (pyridoxin)	B_5 (nicotinic acid?)
	B_5 (nicotinic acid)	B_7 (vitamin I)
	B_3 (pantothenic acid)	B_8 (adenylic acid)
	inositol (q.v.)	B_c
	p-amino benzoic acid (q.v.)	B_p (anti-perosis v.)
Vitamin C....	ascorbic acid	J, vC_2 (anti-pneumonia v.)
Vitamins D...	D_2 (viosterol, calciferol).	Factor T
	D_3, D_4, D_5 and D_6	L and L (lactation v.)
Vitamins E...	α-, β- and γ-tocopherols	M (mouse factor, q.v.)
	H (biotin)	Factor U
	K_1 and K_2	Folic acid (q.v.)
	P (citrin)	Grass time factor (q.v.)

antiberiberi- V. B. **anticanitic-** *p*-Aminobenzoic acid. **antiencephalitic-, antidermatitic-** V. B_5. **antihemorrhagic-** V. J. **anti-infection-** V. A. **antineuritic-** V. B_1. **antipellagric-** V. B_2. **antiperosis-** V. B_p. **antipneumonia-** V. J. **antirachitic-** V. D. **antiscorbutic-** V. C. **antisterility-** V. E. **apparent-** A type of reductone, q.v. **lactation-** Vitamins L. **pro-** See *provitamin*. **sunshine-** V. D. **weight-restoring-** V. B_3.

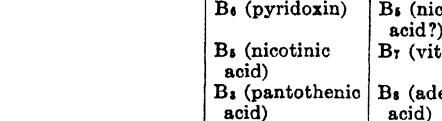
v. A. $C_{20}H_{30}O$ = 286.2. Vitasterol A, biosterin A, v.A_2, ophthalin, anti-infection v. The trimethyl cyclohexenyl dimethyl octatetraene carbinol,



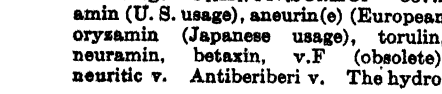
A readily-oxidised, fat-soluble and water-insoluble alcohol in butter, milk, egg-yolk, green vegetables, fish livers (especially of cod, halibut, mackerel and black sea bass), and in glandular fat; yellow isotopic plates, m.63. It has epithelium-protecting and anti-xerophthalmic properties, and is essential to growth; a deficiency of it also results in the common cold. It is derived from carotene, q.v. Activity, 4.5×10^6 I.U. per gm. **v. A_2, v. A_3.** Vitamins similar to v. A, from fish oils; they are probably β-apo-5-carotinols (cf. *cholane*). **v. B.** A complex (see table) now known to consist of the 12 following: $C_{12}H_{17}ON_4SCl.HCl$ = 337.2. Thiamin (U. S. usage), aneurin(e) (European usage), oryzamin (Japanese usage), torulin, polyneuramin, betaxin, v.F (obsolete). **antineuritic v.** Antiberiberi v. The hydrochloride of the aminopyridine sulfonic acid.



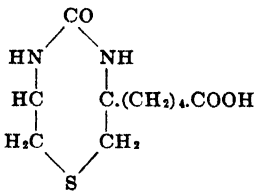
A heat-labile, antineuritic powder, m.249, soluble in water or alcohol, insoluble in ether or benzene; found in the outer coatings of grains, fruits and vegetables (*e.g.*, ripe peas and beans) and in yeast, often with riboflavin (see *v. B_2*). It is oxidised to thiochrome. Activity 3,333,000 I.U. per grm. **v. B_2.** $C_{17}H_{20}N_4O_6$ = 376.2. Riboflavin (U. S. usage), lactoflavin (European usage), uvoflavin, ovoflavin, hepatoflavin. **v. G.** Pellagra-preventing v. The heat stable-lyochromic lactoflavin (q.v.).



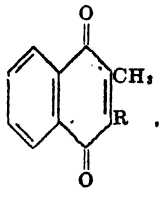
Orange-yellow crystals, m.282 (decomp.), soluble in alkali, slightly soluble in water or alcohol (green-yellow fluorescence), insoluble in ether or acetone. It is widely distributed in plant and animal cells, milk and urine, and has pellagra-preventing properties. Activity, 400,000 Bourquin-Sherman units per gm. **v. B_3.** $C_{19}H_{17}O_5N$ = 339.2. Pantothenic acid (from Greek, "everywhere"), pantothen, antidermatosis factor, chick antidermatitis factor, yeast filtrate factor, chick A.P. (anti-pellagra) factor, liver factor 2. The pale, yellow viscous oil, $OH.CH_2.CMe_2.CHOH.CO.NH.CH_2.COOH$, $[\alpha]_D^{25} + 37.5°$, soluble in water, slightly soluble in ether, insoluble in benzene. It occurs in animal tissues, livers and kidneys, and its absence results in loss of weight; it has been identified with v. B_2 and B_4. Activity, 70,000–75,000 chick units per g. **v. B_4.** Biotin, arginine, glycine (?). A v. of which little is known; it prevents pellagra in rats. **v. B_5.** Nicotinic acid (q.v.) nicotinamide, niacin, niacinamide, P.P. factor, pellagramine, niamid. A v. from living cells, liver and yeast, which prevents pellagra and lesions of the mucous membrane. **v. B_6.** $C_{18}H_{11}O_3N$ = 289.1. Pyridoxin (U. S. usage), adermin (European usage), rat-antidermatitis factor, yeast eluate factor, factor 1, factor Y, v. H., complementary factor. 3-Hydroxy-4.5-di(hydroxymethyl)-2-methylpyridine. Colorless crystalline powder, with a slightly bitter taste, m.160, soluble in water, acetone or alcohol, slightly soluble in ether or chloroform. It occurs in yeast and rice polishings and in seed husks, and prevents dermatitis. **v. B_7.** V.I. A supposed v., which prevents digestive disturbances in pigeons. **v. B_8.** Adenylic acid. A supposed v., the absence of which prevents the development of lactic bacteria. **v. B_c.** A supposed vitamin, which prevents anemia in chicks. **v. B_p.** Antiperosis v. A supposed v., which prevents the deformation of chicks' legs. **v. B_u.** V. H. **v. B_x.** $C_6H_8O_6$ = 176.1. *p*-Amino benzoic acid. **v. C.** Ascorbic acid, hexuronic acid, cevitamic acid, antiskorbutin, scorbutamin. The hexuronic acid,



White colorless, odorless crystals, m.191, soluble in water, slightly soluble in ether or benzene, insoluble in alcohol. It occurs in citrus fruits and green vegetables, and its absence from a diet causes scurvy. Activity, 20,000 I.U. per gm. **v. C_2.** See table. **v. D.** $C_{27}H_{42}O$ = 382.3. Viosterol, vitasterol D, biosterin 2, antirachitic v., rachitamin, irradiated ergosterol, acterol. A fat-soluble v. from milk and fish (cod)-liver oils, produced by activation of provitamins D (q.v.) by ultra-violet light; its absence causes rickets. It is believed to be composed of 10 vitamins, but only 5 have been prepared; viz: **v. D_1.** A mixture of v. D_2 and lumisterol (q.v.). **v. D_2.** $C_{28}H_{43}OH$, activated ergosterol, califerol, viosterol, m.116, an isomer of ergosterol. **v. D_3.** Activated 7-dehydrocholesterol, m.82. **v. D_4.** Activated 2,2-dehydroergosterol, m.107. **v. D_5.** Activated 7-dehydrositosterol. All are white crystalline solids, soluble in fats or organic solvents, insoluble in water. **v. E.** Tocopherol (Greek, "childbirth"), antiencephalomalacin v., factor x, antisterility v., reproductive v., fertility v., sterilamin, vitasterol E, biosterin 3. It comprises: α-tocopherol, $C_{29}H_{50}O_2$; β-tocopherol, $C_{28}H_{48}O_2$; γ-tocopherol, $C_{28}H_{48}O_2$ (activities, 400, 200 and 200 rat units per gm., respectively). They occur principally in plants and vegetable oils. **v. F.** (1) V. B_1. (2) See *vitagens*. (3) A supposed anti-pernicious anemia v. **v. G.** V. B_2. **v. H.** $C_{10}H_{16}O_3N_2S$ = 244.3. Biotin, bios II, bios II B, factor X, factor W, coenzyme R, skin factor.



A v. which occurs widely in nature (*e.g.*, in vegetables and yeast). Its absence causes injury to white of egg, and prevention of the growth of *Saccharomycetes* yeasts and rats. Activity, 27×10^6 rat units = $25{,}000 \times 10^6$ S.U. per gm.; 1 S.U. = the amount of v. H to increase the cell-growth of yeast by 100%. **v. I.** V. B_7. **v. J.** See table. **v. K_1, K_2** . . . etc. α-, β- . . . etc. phylloquinones, coagulation v., anthemorrhagic v., prothrombin F. General formula



where R varies according to the v. K; v. K_1 ($C_{31}H_{46}O_2$) and v. K_2 ($C_{41}H_{56}O_2$) are known for certainty. They occur in hog-liver, leafy vegetables and cereals, and their absence inhibits the clotting of blood. There is as yet no international standard. **v. L.** See table. **v. M.** A supposed vitamin, whose absence causes anemia in and loss in weight of monkeys. **v. P.** (1) Citrin, permeability v. A crude extract from paprika, rose hips or citrus fruits consisting principally of eriodictin (5.7.3′.4′-tetraxhydroxy flavanol) and hesperitin (4′-methyl eriodictin); it decreases the permeability of cells to albumin. (2) V. B_1. (3) V. B_2. **v. T.** A supposed v., the absence of which causes thrombocytosis. **v. U.** A supposed v., which promotes the growth of chicks. **v. units.** The existing (1942) International Units (I.U.) are defined as the activities of:

v. A—0.6 μgm. of pure β-carotene.
v. B—3 μgm. of pure anhydrous aneurin hydrochloride.
C—50 μgm. of pure ascorbic acid.
D—1 μgm. of a certain solution of crude, irradiated ergosterol.
E—1 μgm. of synthetic, racemic tocopheryl acetate.

For v. C: 1 Sherman unit = 0.5–0.6 mgm. ascorbic acid = 1 minimum protective dose (guinea-pig); formerly based on 1 ml. of fresh lemon juice.

For v. D: I.U. = 1 U.S.P. unit = 1 Medical Research Council unit = 1 Coward unit = 0.025γ. v. D_2 = 1.66 Oslo unit = 2.6 prophylactic units = 10^{-6} standard units; 1 clinical unit = 12.5–17.1 I.U.; 1 Steenbock unit = 3.2 I.U.

1, small amount; 2, fair amount; 3, large amount; 4, very large amount.

vitaminosis. Hypovitaminosis. The effect of overdosage with vitamins; cf. *avitaminosis.*
vitasterol. Vitamins A, D, and E.
vitazyme. Homozyme. Ergon. A substance having the properties of both a vitamin (q.v.) and an enzyme. Cf. *biocatalyst, egrine.*
vitellin. A globulin from egg-yolk. Similar proteins occur in lentils, corn and other cereals.
silver- Argyrol.
vitellolutein. The yellow coloring matter of eggs.
vitexine. $C_{21}H_{14}O_6$ = 362.09. A coloring matter and flavone glucoside in *Vitex litoralis*, a Verbenaceae.
vitiatine. $C_8H_{14}N_6$ = 158.07. A meat base.
vitol. Vitamin.
vitrain. A constituent of *coal*, q.v.
vitreosil. A translucent variety of prepared silica, made by fritting sand with a hot carbon plate; used for heat-resisting apparatus.
vitreous. Glassy. **v. copper ore.** Redruthite. **v. silver ore.** Argentite.
vitrescence. The property of becoming hard and transparent like glass.
vitrification. The conversion of a material into a glass or glass-like substance, having increased hardness and brittleness.
vitrify. To sinter or melt to a glassy mass.
vitrinite. A uniform brown constituent of coal, which has a low ash content, and consists mainly of ulmin compounds. Cf. *vitrain.*
vitriol. A surface of a heavy metal; as,

blue- or Roman-	copper sulfate (chalcanthite)
green-	ferrous sulfate (copperas)
red- or rose-	cobaltous sulfate (bieberite)
uran-	uranium sulfate (johannite)
white-	zinc sulfate (goslarite)

oil of- Sulfuric acid. Cf. *B.O.V., D.O.V., R.O.V.* **salt of-** Zinc sulfate.
vitriolate. An obsolete term for the sulfate of a metal. **v. of soda.** Sodium sulfate. **v. of tartar.** Potassium sulfate.
vitro- A Latin prefix, which means glass and indicates a mineral or rock of glassy texture; as vitrophyric. **in v.** See *in vitro.*
vitrophyric. Describing an igneous rock having a glassy base.
vivianite. $Fe_3(PO_4)_2.8H_2O$. Blue ocher, blue iron ore. A native ferrous phosphate which, when freshly broken is white, and becomes bluish on oxidation.
vivo. Pertaining to life. **in v.-** See *in vivo.*
vocoder. An instrument for synthesising speech and other sound-effects by electrical methods.
Vogel, August. 1817–1889. A German agricultural chemist, noted for his methods and text books.
volatile. Describing a substance that evaporates rapidly. **v. alkali.** Ammonia. **v. oils.** Essential oils. **v. poisons.** A poisonous substance that forms vapors:
non-metallic poisons: Br, Cl, I, F, HF, P, AsH_3, SbH_3, BiH_3, PH_3 and H_2S.
organic poisons: chloral, chloroform, ether, aniline, acetanilide, etc.
volatility product. A conception analogous to that of the solubility product (q.v.), applied to a solid substance (as ammonium carbonate) which dissociates into two volatile gases when heated. The product of the concentrations of the constituent gases is constant.
volatilization. Vaporisation: the conversion of a solid into a vapor or gas without chemical change.
volatilize. To convert into a gas or vapor.
volborthite. A native hydrous copper-calcium vanadate.
volcanic. Pertaining to molten rock or lava. **v. ash.** Tuff. **v. glass.** A volcanic igneous rock; as, obsidian or pitchstone. **v. mud.** A mud consisting of fine grained ash or tuff mixed with water.
volemite. Volemitol.
volemitol. $C_7H_{16}O_7$ = 212.2. Heptahydroxyheptane, heptaheptanol, volemite, α-sedoheptitol. The heptatomic alcohol, $CH_2OH(CHOH)_5CH_2OH$, m.150, $[\alpha]_D$ + 2.25–2.65, from *Lactarius volemus* and *Primula* species. Cf. *primulite.*
Volhard, Jakob. 1834–1910. A German organic chemist, noted for his analytical methods. **V.'s solution.** A decinormal solution of potassium thiocyanate. **V.'s volumetric method.** The determination of halogens by means of standard thiocyanate solutions.
volkonskoite. A magnesium chromium silicate containing 30 % Cr_2O_3; used as zeolite, q.v.
volt. A unit of electromotive force and potential difference. It is the potential or electrical pressure which, if steadily applied to a conductor of one ohm resistance, will produce a current of one ampere.

$$1 \text{ International volt} = 10^8 \text{ e.m.u.} = \frac{1}{300} \text{ e.s.u.}$$
$$= 1.00043 \text{ absolute volt.}$$

The electromotive force of a Weston normal cell at 20°C. is 1.0183 international volts. **ampere-** Watt. **electron-** See *electronvolt.*
Volta, Count Alessandro. 1745–1827. An Italian physiologist; noted for his early electrical experiments, and the construction of the first electric pile. **v. couple.** An electric cell which consists of a zinc anode and copper cathode and has a potential of 0.98 volt. **v. effect.** The change in the sign of the charge on a metal electrode after it has been heated. **v. series.** Displacement series.
voltage. The electromotive force measured in volts. See *potential.*
voltaic. Pertaining to a direct electric current. **v. battery.** A number of v. cells. **v. cell.** An electric cell or device in which an oxidation-reduction reaction occurs in such manner that an electromotive force is produced. Classification:

A. Double fluid cells—
(see) Bunsen cell
Dichromate cell
Daniell cell
Grove cell
Marie-Davy cell
Partz cell
B. Single fluid cells—
(see) Léclanché cell
Chaperon cel
Edison-Lelande cell
Gassner cell
Regnault cell
Poggendorff cell
C. Standard cells—
(see) Weston normal cell
Cadmium cell
Clark standard cell
D. Secondary cells—
(see) Lead accumulator
Reguir cell
Edison cell

v. couple. A pair of metallic electrodes used to produce a potential when set up as a cell; as a volta couple. **v. electricity.** Galvanic electricity, chemical electricity. A continuous stream of electrons caused by a chemical reaction; a direct current of electricity, q.v. **v. pile.** A series of metallic discs forming a v. battery.

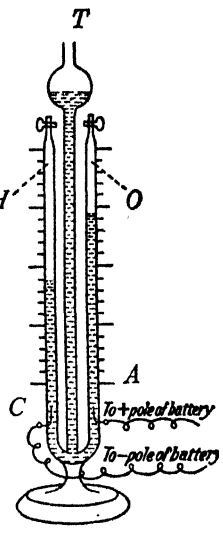
voltaite. The mineral $2(FeAl)_2O_3,5(MgFeNa_2K_2)(OH)_2(SO_4),14H_2O$.

voltameter. Coulometer. An apparatus for the electrolysis of water. The volume of the gases liberated is used to determine the number of coulombs of current flowing in the circuit during the decomposition. Cf. *voltmeter*.

voltammeter. A measuring instrument that indicates both volts and amperes.

voltampère. The equivalent of the watt power factor, q.v. It is the product of a volt and a milliampere.

voltmeter. A measuring instrument that indicates voltage. Cf. *voltammeter*.



Voltameter.

H = *hydrogen*, O = *oxygen*, C = *cathode*, A = *anode*.

voltoids. Small compressed tablets of ammonium chloride, used in the preparation of voltaic (Léclanché) cells.

voltolise. To subject to a silent electric discharge.

voltzite. Zn_3OS_4. A native zinc oxy-sulfide.

volume. The space occupied by a substance. It is generally expressed in cubic centimeters or liters according to the formula, $V = CL^3$, in which C is a constant depending on the shape of the space occupied (if a cube, C = 1) and L is the length. **atomic-** the quotient of the atomic weight and the specific gravity of a solid or liquid element: at. vol. = at. wt./d. It varies periodically with the atomic weight. **critical-** The volume occupied by 1 gram of a gas at the critical temperature and pressure. See *parachor*. **co-** The quantity *b* in van der Waals equation, q.v. **incompressible-** That which cannot be made smaller by pressure. **molecular-** The volume occupied by one gram-molecule or mole of any substance, *i.e.*, the molecular weight divided by the density. It varies for solids and liquids according to their atomic volumes, but is 22.4 liters for gases at normal temperature and pressure. See *parachor*. **specific-** The volume occupied by one mole of a substance; hence, M/D = sp. vol., where M is the molecular weight, and D the density. **standard-** The volume occupied by one mole of gas at 0°C. and 760 mm. pressure = 22.4 l.

v. susceptibility. The ratio of the intensity of magnetization of a medium to the strength (in gauss) of the magnetic field inducing it.

volumenometer. (1) An apparatus for the accurate determination of the volume of a known weight of substance, and thence its density. (2) An obsolete term for pyknometer.

volumetric. Pertaining to measurements of volumes. **v. analysis.** The quantitative analysis of a known volume of an unknown solution by adding a reagent of known concentration until the end-point of the reaction has been reached. From the amount of reagent used (volumetric solution), the amount of substance in the analysed solution can be calculated. In order to establish a definite end-point, a third substance, the indicator, may be added. Methods of volumetric analysis may be classified as:

A. Neutralization methods.
(alkalimetry, acidimetry)

Titration with acids or bases using an indicator.

1. Acids—hydrochloric, sulfuric, oxalic acid.
2. Bases—potassium, sodium ammonium or barium hydroxides, sodium carbonate.
3. Indicators—Phenolphthalein, methyl orange, litmus.
4. Strength of solutions—N, N/2 or N/10.

B. Oxidation-reduction methods.
(oxidimetry, iodometry)

Titration with oxidizing or reducing agents, and determining the end-point by decolorization or change of color.

1. Oxidizers—Potassium permanganate or iodine.
2. Reducers—arsenous acid, oxalic acid, ferrous ammonium sulfate.
3. Indicators—starch, potassium iodide, redox indicators.
4. Strength—N/10.

C. Precipitation methods.

Titration with a reagent that causes a precipitation.

1.2. Solutions—silver nitrate, ammonium thiocyanate.
3. Indicators—Potassium chromate, ferrous sulfate.
4. Strength—N/10.

v. glass ware. The graduated glass utensils used to measure definite quantities of a solution, *i.e.*, burettes, cylinders, flasks and pipettes. Their comparative accuracy is shown by their limits of error (cf. *standardized*):

Capacity	Possible error.				
	Transfer Pipet	Measuring Pipet	Buret	Flask	Cylinder
2 cc.	0.012 cc.	0.02 cc.			
5 cc.	0.02 cc.	0.04 cc.			
10 cc.	0.04 cc.	0.06 cc.	0.04 cc.	0.06 cc.	0.05 cc.
25 cc.	0.06 cc.	0.1 cc.	0.06 cc.	0.06 cc.	0.12 cc.
50 cc.	0.1 cc.		0.1 cc.	0.1 cc.	0.25 cc.
100 cc.	0.16 cc.		0.1 cc.	0.16 cc.	0.20 cc.
250 cc.	0.24 cc.			0.22 cc.	1.25 cc.
500 cc.				0.30 cc.	2.5 cc.
1000 cc.				0.6 cc.	5.0 cc.
2000 cc.				1.00 cc.	10.0 cc.

For more accurate work certified glassware is used (see *standardized buret*, etc.).

v. factor. The amount of substance corresponding with 1 cc. of normal, half-normal,

or tenth-normal solution. **v. solutions.** V.S. Solutions of known strengths used in volumetric analysis. See *normal solution.* **v. standards:**

Primary: when the composition is gravimetrically determined; as, H_2SO_4 is precipitated with $BaCl_2$ and weighed as $BaSO_4$.

Secondary: when standardized against a weighed amount of reagent, *e.g.*, NaOH soln. against pure oxalic acid.

Tertiary: when one soln. is titrated against another soln., *e.g.*, HCl titrated with NaOH (which is standardized against oxalic acid).

v. weight. The amount of substance to be weighed off in order that, on titration, the number of cubic centimeters found will equal the percentage of unknown present.

voluminal. Pertaining to three dimensions. **v. expansion.** Cubical *expansion.*

voluntal. $C_3H_4O_2NCl_3$ = 192.39. Trichloroethylurethan, β-trichloroethylcarbamate; $NH_2CO\text{-}OCH_2CCl_3$. A white crystalline powder, used as anesthetic.

volutin. A nucleo-protein from yeast.

vomicine. $C_{22}H_{24}N_2O_4$ = 382.2. An alkaloid from strychnos.

V.S. Abbreviation for volumetric solution.

vug. A cavity in a casting. **v. crystals.** The metallic crystals found inside v.

vulcanite. A hard rubber produced by heating caoutchouc or india rubber with sulfur. Cf. *ebonite.*

vulcanization. The oxidation of rubber produced by reducing sulfur to sulfides. The rubber is mixed with a vulcanizing agent (as, sulfur), and heated to 110–140°C. A gradual change takes place from a tacky, plastic mixture to a non-tacky, strong, very elastic or rigid product. Various other substances, *accelerators,* may be added to increase the quality of the product. (See *vulcanizing agent.*)

vulcanize. To produce vulcanization.

vulcanized. Having been subjected to vulcanization. **v. fiber.** See *fiber.* **v. paper.** See *fiber.*

vulcanizing agent. A substance that renders rubber less sticky and more or less elastic and rigid. *E.g.*, sulfur (chiefly), selenium, sulfur-dichloride, or *m*-dinitrobenzene; also nitrogen compounds such as, di- and triphenylguanidine, tetramethylthiuram and piperidine derivatives.

vulnerary. A substance used externally in the treatment of wounds and bruises; any agent that has a healing effect on wounds.

vulpic acid. $C_{19}H_{14}O_8$ = 322.11. Chrysopicrin. An acid from the lichen, *Cetraria vulpina.*

vulpinite. An amorphous form of anhydrite.

vuzine. $C_{27}H_{40}N_2O_2$ = 424.3. Isooctylhydrocupreine. A levorotatory quinine (q.v.) alkaloid. Colorless powder, insoluble in water, soluble in alcohol or ether. **v. hydrochloride.** $C_{27}H_{40}N_2O_2.HCl.2H_2O$ = 533.44. Colorless crystals, soluble in water; used as a powerful bactericide for deep-seated wounds.

W

W. (1) The symbol for tungsten (wolfram). An abbreviation for: (2) work, (3) watt. **W-rays.** The radiations intermediate between U.V.-(ultraviolet, *q.v.*) and X-rays.

w. An abbreviation for: (1) weight, (2) work.

Waage, Peter. 1833–1900. A Norwegian chemist noted for developments in physical chemistry.

Waals. See *van der Waals.*

wabain. $C_{36}H_{46}O_{12}$ = 670.4. A glucoside from the root of *Carissa schimperi* (waba), an apocynaceous tree of Africa. It is a heart stimulant and local anesthetic. Cf. *ouabain.*

Wackenroder's reaction. The reaction between hydrogen sulfide and sulfur dioxide in aqueous solution to form polythionic acid.

wad. (1) Bog manganese. An earthy hydrate of pyrolusite, which contains baryta. Cf. *psilomelane.* (2) Graphite.

Waelz process. A charge of low grade zinc ore is heated with fuel oil or powdered coal in a rotary kiln; volatilized Zn and ZnO are obtained.

wafer. A thin, double layer of dried paste that encloses a medicament. **w. ash.** The bark of the root of *Ptelea trifoliata*, a Rutaceae; used medicinally as a tonic and antiperiodic.

wagnerite. $Mg(MgF)PO_4$. A native magnesium fluophosphate. Cf. *adelite.*

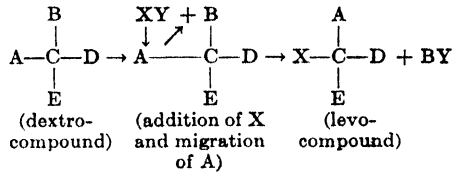
Wagner's reagent. An aqueous solution of I and KI, used as microchemical reagent for alkaloids.

wagofo. An African arrow poison, the dried juice of *Euphorbia* species.

wahoo. Euonymus.

Paul Walden.

Walden, Paul. 1863– . A German organic chemist, noted for research on organic reactions. **W. inversion.** A chemical reaction in which a reversal of the rotatory power of an optically-active compound takes place. It indicates that the mechanism of substitution does not involve the simple replacement of one group by another, but probably the loosening of all groups and atoms followed by a rearrangement.



For example: d-chlorsuccinic acid changes on treatment with potassium hydroxide to l-malic acid, instead of, as expected, to d-malic acid; while l-chlorsuccinic acid changes to d-malic acid and not to l-malic acid.

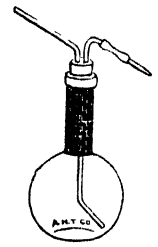
Wallach, Otto. 1847–1931. A German chemist and Nobel prize-winner noted for his research on the constitution of essential oils.

walnut. Juglans. **w. oil.** The clear, colorless oil of walnuts, $d._{25^\circ}$0.923, n_D^{25}. 1. 4750; sapon. no. 193.2, iodine no. 150.6. Used as an emulsifier in cosmetics.

warfare gas. See poison *gas.*

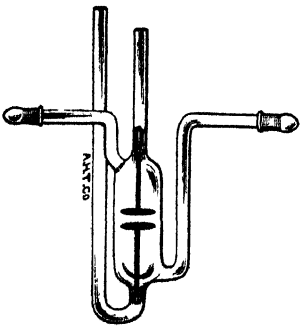
warringtonite. Domingite.

wash-bottle. A glass flask fitted with a stopper and two unequally-long tubes, so arranged that on blowing through one, a stream of water emerges from the other. Used to wash precipitates on filters, and in other chemical operations.



Wash-bottle for hot water.

Washburn cell. A glass vessel with two electrodes; used for the accurate determination of the electrical conductivity of solutions (see illustration).



Washburn cell.

washing. Rubbing and rinsing with a liquid. **w. bottle.** See *wash-bottle.* **w. soda.** Sodium carbonate.

Wassermann, August von. 1866–1925. A German biochemist. **W. reaction.** Σ test. A diagnostic reaction for syphilis, in which a series of blood samples is subjected to the ac-

tion of various hemolytic sera. Cf. *complement fixation.*

waste. Matter or energy which is not utilized. **industrial-** Materials as spent acid, flue gas, sulfite liquor, refuse, sewage, paper, metal scrap, rubber waste, distillery slop, etc. Cf. *xylan.*

water. (1) H_2O = 18.016. Hydrogen oxide. A colorless and tasteless liquid, forming the larger proportion of the earth surface, m. (or freezes) 0°C (= 32°F = 0°R), b.100°C (= 212°F = 80°R); it is the most widely-used solvent. It was regarded as an element by the alchemists, and was first recognized as a combustion product of hydrogen by Cavendish in 1781, as a compound of oxygen and hydrogen by Lavoisier in 1783, and as a mixture of isotopic compounds in 1933. (Cf. *heavy-*). Its exact structure is still undetermined but it must be a mixture of multiples of H_2O; as, H_4O_2 dihydrol, H_6O_3, trihydrol, etc. Cf. *ice w., steam w.* Water is an essential constituent of all living organisms, and occurs as "water of crystallization" in many crystals and compounds. (See *water constants.*) (2) Aqua. Pharmaceutically, a weak solution of a volatile substance in water; as, peppermint w., rose w., chlorine w., ammonia w. (3) The transparency of a precious stone, as of a diamond. **acidulous-** W. containing dissolved CO_2, together with alkali bicarbonates and common salt. The CO_2 may be liberated with effervescence when such w. is slightly warmed; *e.g.*, Appolinaris and Seltzer (*i.e.*, Selters) w. **aerated-** A water containing a gas; as, air or carbon dioxide. **alkaline-** A mineral w. containing bicarbonates of Na, and sometimes of Li and K; *e.g.*, Vichy w. **bitter-** A mineral water containing the sulfates of Na and Mg; *e.g.*, Marienbad w. **bound-** That portion which does not freeze when the system (*e.g.*, tissue, colloid, etc.) is maintained at −20°C. **capillary-** The w. of the soil held between rock interstices above the ground water. **carbonated-** A drinking water containing CO_2 under pressure. **chalybeate-** Ferruginous w. A mineral w. containing ferrous carbonate held in solution as bicarbonate; as, Pyrmont w. **cologne-** A water containing essential oils (such as bergamot, orange flower, lavender) used as a household perfume. **conductivity-** A water distilled repeatedly through silver stills; used as a solvent in electrolytic measurements. **crystal-** W. of crystallization. **distilled-** W. that has been purified by distillation. **drinking-** W. which contains neither a pathogenic organism nor a large amount of organic matter. The total solids do not exceed 1000 parts per million and the following upper limits apply: Pb 0.1, Cu 0.2, Zn 0.5, Fe 0.3, Mg 100, Cl^- 250, SO_4^{--} 250 pts. per million. **ferruginous-** Chalybeate-. **free-** That portion of a system which freezes. Cf. *bound-*. **ground-** The water which lies at a definite level beneath the soil. **hard-** W. that contains the carbonates and bicarbonates of calcium and magnesium; hence it forms insoluble compounds with soap and prevents the formation of lather. See *w. purification.* **heavy-** (1) Deuterium oxide, D_2O or H^bO = 20.0. The isotopic compound of hydrogen of mass 2 (deuterium, diplogen) with oxygen. Its physical constants as compared with light water, are:

	Light- H_2O	Heavy- D_2O
d. (20°C)	0.9982	1.1056
m	0°C	3.802°C
b	100°C	101.42°C
refractive index	1.33293	1.3281
viscosity	10.87	14.2
surface tension	72.75	67.8
Raman spectrum	3420 A.U.	2549 A.U.

(2) One of the other isotopic compounds; as, DOH, TOT, TOH, TOD, where D is hydrogen of mass 2, T hydrogen of mass 3 (tritium); or H_2O^b, H_2O^c, D_2O^b, D_2O^c, T_2O^b, T_2O^c, where O^b is oxygen of mass 17, and O^c oxygen of mass 18, or a combination of these (as, DO^bH). **hepatic-** A mineral w. containing hydrogen sulfide and alkali sulfides; *e.g.*, Harrogate w. **ice-** Freshly molten water containing smaller aggregates of $(H_2O)_x$ than does water at 4°C. Cf. *steam w.* **industrial-** W. that can be used for washing or like process work, but is not necessarily potable. **juvenile-** W. of deep-seated origin, that is supposed to have reached the surface of the earth for the first time. **light-** Protium oxide. See *heavy-*. **meteoric-** W. coming from the atmosphere; as, rain and snow. **mineral-** A natural w. used for therapeutic purposes on account of special constituents: (1) acidulous, (2) chalybeate, (3) hepatic, (4) alkaline, (5) bitter, (6) siliceous w.; (7) hot springs, which may contain traces of radium emanation to which their medical properties are attributed. **natural-** A w. as it occurs in nature. It contains various impurities and may be classified as: rain, snow, river, spring or deep well w., sea and mineral waters (cf. table). The impurities may be suspendde, or dissolved solids and gases. **potable-** W. that is fit to drink; *e.g.*, non-typhoid, non-polluted. Cf. *drinking-*. **pure-** W. that has been repeatedly distilled and subjected to purifying operations. It is very difficult to obtain and to maintain in a state of purity. **sea-** Ocean w. which contains on an average of 3.6 per cent. of solids, of which 2.6 per cent. is sodium chloride. See *hydrosphere.* **siliceous-** W. containing dissolved colloidal silica and alkali silicates, *e.g.*, the almost boiling w. of the geysers of Iceland, New Zealand, and Yellowstone Park. **soda-** q.v. **soft-** (1) Rain w. or snow w., which is naturally free from Ca and Mg salts. (2) Water that has been purified by removal of Ca and Mg salts. See *hard w., w. purification.* **steam-** Freshly-condensed w. It contains a different proportion of dihydrol and trihydrol, and has different biochemical properties to ice w. (q.v.). **sterilized-** W. in which all micro-organisms have been destroyed. **sweet-** Water containing glycerin residues; a waste product from soap manufacture.

NATURAL WATERS

Classified according to the negative or positive ions present

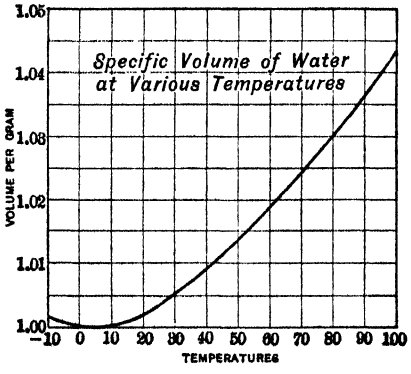
A. *Chloride* waters; principal negative ion is Cl^-.
   a. principal positive ion is sodium.
   b. principal positive ion is calcium.
   c. waters rich in magnesium.

B. *Sulfate* waters; the principal negative ion is SO_4^{--}.
   a. principal positive ion is sodium.
   b. principal positive ion is calcium.
   c. principal positive ion is magnesium.
   d. waters rich in iron or aluminum.
   e. waters containing heavy metals.
C. *Sulfate-chloride* waters; both SO_4^{--} and Cl^- are abundant.
D. *Carbonate* waters; the principal negative ion is CO_3^{--} or HO^-.
   a. principal positive ion is sodium.
   b. principal positive ion is calcium.
   c. chalybeate waters.
E. *Sulfate-carbonate* waters; SO_4^{--} and CO_3^{--} abundant.
F. *Chloro-carbonate* waters; Cl^- and CO_3^{--} abundant.
G. Triple waters containing Cl^-, SO_4^{--} and CO_3^{--} in notable amounts.
H. *Siliceous* waters, rich in silica.
I. *Borate* waters; the principal negative radical is $B_4O_7^{--}$.
J. *Nitrate* waters; the principal negative ion is NO_3^-.
K. *Phosphate* waters; the principal negative ion is PO_4^{---}.
L. *Acid* waters, containing free acids
   a. chiefly sulfuric acid.
   b. chiefly hydrochloric acid.

(From Clarke, Data on Geochemistry.) See *mineral waters.*

w. of constitution. W. which is chemically combined, as in hydroxides and acids. **w. of crystallization.** W. that is a physical constituent of crystals or hydrated salts, and may be removed at 100°C. **w. of hydration.** *W. of crystallization*, or *w. of constitution*, cf. *hydrates.*

w. analysis: (1) Sanitary-. The determination of the harmful constituents of water, both bacteriologically and chemically. This includes determinations of the different types of nitrogen (ammoniacal n., albumenoid ammonia



Specific volumes of water.

n., nitrite n., nitrate n.), oxygen consumed, total solids, alkalinity, hardness and halogens. Decaying vegetable and animal matter is indicated by the nitrogen present. (2) Complete. The determination of all inorganic constituents of w. These methods are illustrated by the following analyses of the same sample: (from F. W. Clarke, Data on Geochemistry).

(1) Results stated as oxides:

SiO_2	0.891	*grains per gal.*
SO_3	32.601	
CO_2	4.554	
Cl	2.681	
Na_2O	11.463	
K_2O	0.355	
CaO	13.117	
MgO	5.530	
$(FeAl)_2O_3$	0.189	
Mn_2O_3	0.189	
loss on ignition	2.397	
	73.967	
Less O = Cl	0.604	
	73.363	

(2) Results in terms of salts:

$CaSO_4$	457.7	*parts per mill.*
$MgSO_4$	236.0	
K_2SO_4	9.4	
Na_2SO_4	62.5	
NaCl	63.2	
Na_2CO_3	156.9	
Na_2SiO_3	21.9	
$(FeAl)_2O_3$	2.7	
Mn_2O_3	2.7	
loss on ignition	34.2	
excess SiO_2	1.3	
	1048.5	

(3) Results recorded in ions and radicals.

SiO_3	1.26	*% of total solids*
SO_4^{--}	55.28	
CO_3^{--}	8.78	
Cl^-	3.79	
Na^+	12.02	
K^+	0.41	
Ca^{++}	13.24	
Mg^{++}	4.49	
R_2O_3	0.53	
	100.00	

Ignition loss (organic matter) is omitted. Salinity 1014 parts.

w. bath. A vessel of boiling water used in the laboratory to evaporate substances placed in a smaller vessel above it. **w. constants.** The physical properties of ordinary water: (Cf. *heavy w.*).

(a) density—greatest at 4°C.; hence, one cc. water at this temperature is taken as the unit of mass = 1 gram. The density varies slightly with temperature:

0°C	0.99987
1°C	0.99993
2°C	0.99997
3°C	0.99999
4°C	1.00000
5°C	0.99999
6°C	0.99997
7°C	0.99993
8°C	0.99988
9°C	0.99981
10°C	0.99973

(b) heat of fusion..... 79 calories per gram.
(c) heat of vaporization. 536 calories per gram.
(d) specific heat..... 1.00477 at 5°C
1.00000 at 15°C
0.99765 at 25°C
0.99829 at 50°C
1.00001 at 60°C
1.00645 at 100°C

(e) critical temperature... 370°C
(f) critical pressure..... 195.5 atm.
(g) critical volume..... 2.33
(h) degree of ionization... 10^{-7} moles per liter;

The concentration of hydrogen ions and hydroxyl ions is each 0.000 0001 gram per liter. **w. culture.** An experimental method of growing plants by using alternately a nutrient 0.01 molar solution of KNO_3, $CaSO_4$ and $MgHPO_4$ with or without some other salt or ion in minute quantity. Cf. *bioelements, hydroponics, nutrient media, plant food.* **w. detection.** Minute traces of water or moisture are recognized by: (1) Potassium-lead iodide paper (filter paper saturated with a solution of potassium lead iodide in acetone), which becomes yellow. (2) Anhydrous copper sulfate, which is colorless and turns blue. **w. distillation.** The evaporation and condensation of w. To remove all dissolved material distil in a quartz or silver vessel first from an alkaline solution of permanganate, then from sulfuric acid. Cf. *conductivity w.* **w. flowers.** Ice flowers. **w. gas.** A mixture of hydrogen and carbon monoxide, obtained by the action of steam on glowing coal. **w. glass.** Sodium silicate. **w. metabolism.** The daily balance of water in the human body; *e.g.*, in 24 hours:

Intake	
solid food	700 cc
drinking water	600 cc
beverages	600 cc
metabolic water	300 cc
total	2200 cc

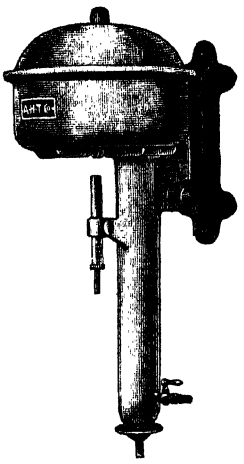
Output	
urine	800 cc
skin	700 cc
lungs	600 cc
feces	100 cc
total	2200 cc

w. pollution. The contamination of natural waters by the influx of wastes (q.v.) from sewage or an agricultural or industrial plant. **w. proof.** Rain proof. Impermeable to water. See *india-rubber.* **w. purification.** The more or less complete removal or destruction of salts or organisms which occur in natural waters; *e.g.*, by

softening	partial removal of salts.
distillation	complete removal of salts
filtration	partial removal of organisms
sterilization	complete destruction of organisms.

w. softening. The removal of Ca^{++} or Mg^{++} either by: (a) filtration through permutite or natural zeolites, in which calcium ions are replaced by sodium ions; (b) heating, which removes Ca^{++} as calcium carbonate (boiler scale); (c) chemical treatment with lime, alumina, etc. **w. sterilization.** The destruction of bacteria and spores by heat, or their removal in porcelain filters. **w. still.** A device for the continuous production of distilled water (see illustration).

watermint. The dried leaves of *Mentha aquatica*, a Labiatae, containing essential oils and tannin. Used medicinally as an antispasmodic and stimulant.



Water still.

waterpepper. Smartweed. The dried herb of *Polygonum punctatum*, a Polygonaceae. Used, as the fluid extract, as a stimulant and diuretic.

waterproofing. Making a substance impermeable to moisture.

Watt, James. 1736–1819. The Scottish inventor of the first steam engine (1769).

watt. Ampere-volt, volt-ampere. A unit of power, or time-rate at which work is done: 1 watt = 1 joule (ten million ergs) per second, or the energy expended per second by an unvarying current of 1 ampere under a potential of 1 volt. Conversion formulas:

watts = volts × amperes = amp.^{2} × ohms = volts^2 ÷ ohms
1 kilowatt = 1000 watts
1 watt = $\frac{1}{746}$ horsepower
1 watt-hour = 3600 joules = 1 kelvin
1 kilowatt-hour = 3,600,000 joules

international watt- The energy expended per sec. by an unvarying electric current of 1 international ampere under an electrical pressure of 1 international volt.

wattage. The amperage multiplied by the voltage.

wattle gum. Australian gum. A gum from *Acacia pycnantha*, a Leguminosae of Australia and South Africa.

Watts, Henry. 1815–1884. An English chemist, noted as editor and author (*Journal of the Chemical Society* and *Dictionary of Chemistry*).

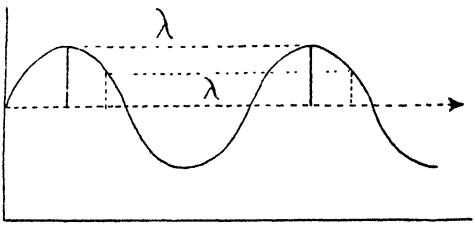
wave. (1) A to-and-fro motion of the particles of a solid, liquid or gas. (2) The harmonic curve obtained on plotting distance and time for points representing either particles or centers of force in rhythmic motion. **longitudinal-** Forward and backward motion of particles in the direction in which the wave moves, as sound waves in air. **transverse-** Up and down motion, or motion at right angles to the direction in which the wave moves. Cf. *radiations, electromagnetic-*.

w. front. The surface of propagation, at right angles to the direction of motion, which passes through corresponding points of a number of waves. **w. function.** The factor ψ in Schrödinger's equation, q.v. **w. length.** The distance between corresponding points on two adjacent waves. (For wavelength of radiations see *spectrum;* of sound, see *sound.*) **w. mechanics.** Quantum mechanics. A mathematical theory which aims to explain the velocity (v) and position (p) of electrons from statistical determinations, where one value (*e.g.*, v) can be determined and the other (*e.g.*, p) is undeterminable, by predicting the probable range of values. It is assumed that the motion of each

particle of mass (m) is associated with a wave of wave-length λ, and that $\lambda = h/mv$; also $mc^2 = h\nu$, where c is the velocity of light. The velocity of the wave is $\mu = \lambda\nu$. Cf. *Heisenberg principle*. The λ of any line is related to the corresponding energy change (in volts) by $\lambda = 12{,}336/V$; thus for sodium in the lowest energy state, 3s, the following transition is possible:

	λ_c	λ_a
to 3p, absorbing 2.09 V	= 5901	or 5896
to 4p, absorbing 3.73 V	= 3310	or 3303
to 5p, absorbing 4.32 V	= 2860	or 2853

where the calculated lines, λ_c, agree fairly well with the actual lines, λ_a. **w. motion.** The progressive disturbance of particles in a medium. The speed with which this disturbance is propagated is the velocity of the wave, c; this depends on the wave-length, λ, and the time period, T, or on the frequency, ν; hence $c = \lambda/T$, $= \nu\lambda$, and $\nu = c/\lambda$. **w. number.** The number of waves per unit length; for light, $n = 1/\lambda$ (if λ is measured in cm.), or $n = 10^8/\lambda$ (if λ is measured in Angström units), where n is the number of waves per centimeter. Cf. *Ritz formula*. **w. theory.** Radiations comprise a moving electric (E) and magnetic (M) field at right angles to each other, and in the direction of propagation. Cf. *quantum theory*.



Wave theory.

The vector (E) is accompanied by (M) at right angles. Wave-length (λ) is the distance between points having the same magnitude of force. Frequency (ν) is the number of oscillations in unit time at a given point.

wavellite. $Al_3(OH.F)_3.(PO_4)_2$. A native aluminum phosphate, containing some fluorine.

wax. (1) A material consisting of mixtures of esters, fatty acids, high atomic alcohols and even hydrocarbons. Cf. *sterols*. (2) One of a group of plastic substances obtained from plants or deposited by insects, which consists of the esters of fatty acids with high-atomic alcohol radicals; as,

bees-wax . . . myricyl palmitate, $C_{30}H_{61}.C_{16}H_{31}O_2$

spermaceti . . . cetyl palmitate, $C_{16}H_{33}.C_{16}H_{31}O_2$

Waxes differ from fats in that they are the esters of monohydric, high-atomic alcohols; whereas, fats are the esters of trihydric, low-atomic alcohols (as glycerol). **bees-** See *beeswax*. **carnauba-** See *carnauba wax*. **Chinese-** q.v. **C.K.- seekay-** A synthetic wax prepared by chlorinating naphthalene. **cochineal-** Coccerin. **earth-** Ceresin. **fossil-** Ozokerite. **insect-** Chinese-. **Japan-** q.v. **Java-** Ceryl alcohol. **mineral-** Paraffin-. **montan-** q.v. **palm-** q.v. **paraffin-** q.v. **peat-** See *peat*. **pisang-** q.v. **sealing-** q.v. **sugar cane-** Cerosin. **white-** Cera alba. A bleached beeswax. **yellow-** Cera flava. Beeswax. A soft yellow solid, obtained by melting and purifying the honeycombs of the bee; insoluble in water, slightly soluble in alcohol, soluble in ether, chloroform or oils. **wool-** See *wool fat*.

w. tailings. The residual product remaining after the destructive distillation of petroleum; it consists of the solid hydrocarbons, chrysene, picene and other products. It resembles asphalt, and is used for waterproofing and as a filler in cheap greases.

weak. (1) Not strong. (2) Not ionizing greatly. **w. acid.** An acid that does not ionize greatly. **w. base.** A base which does not ionize greatly. **w. salt.** A salt that does not greatly ionize. Cf. *ionization*.

weathering. Describing group of chemical reactions which change the composition of rocks; such as the effect of air, water, bacteria, and the physical action of heat and freezing which disintegrate the rock.

weber. Coulomb.

Weber's law. The sensation is proportional to the natural logarithm of the stimulus; the increase of a stimulus necessary to cause an increase in sensation is a constant fraction of the whole stimulus.

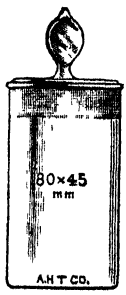
websterite. $Al_2SiO_6,9H_2O$. A native hydrous aluminum silicate. Cf. *cecilose*.

wedge. A solid object with a triangular section, used to separate surfaces by the forcible introduction of the pointed end **w. photometer.** A photometer in which the illuminations on two faces of a wedge are matched.

Weigert effect. The dichroism shown by a colloidal suspension or gel.

weighing. The act of measuring the gravitational attraction of an object. **double-** A method of finding the weight of an object independently of any variation in length of the two balance arms. If the object weighs *a* when placed on one pan, and *b* when on the other, then the weight is given by $\sqrt{ab}$.

w. bottle. A small, stoppered, thin-walled, light glass vessel, used to weigh quantities of a substance for analytical purposes. **w. by substitution.** A method used to obtain the weight of an object independently of the lengths of the arms of the balance. The object is counterpoised by lead shot, then removed, and the lead shot counterpoised by weights. **w. by swings.** A method in which the lack of sensitiveness of the balance is compensated by noting the swings of the balance-pointer, and the distances traversed to left and right. The equivalent in milligrams of a fraction of a division on the pointer-scale is then calculated from the means of the scale-divisions of a number of swings on each side, and thence that also of the mean of the swings on both sides.



Weighing bottle.

weight. The degree of heaviness or the force with which a body is attracted by the earth. It differs according to the geographical location, cf. *mass*. **atomic-** The relative weight of an atom of an element as compared with an atom of hydrogen. **carrier-** The weight of

substance (*e.g.*, protein) which carries 1 gm.-equivalent of prosthetic groups. **combining-** Equivalent weight. **equivalent-** The weight of a substance that can combine with or displace one unit-weight of hydrogen, or its equivalent of another substance. **isotopic-** The relative mass of an isotope, q.v.; it approaches a whole number. **molecular-** The sum of the atomic weights of the atoms contained in a compound. **specific-** See *specific gravity*.

w. buret. A small bottle with a tap and jet, used for accurate titration. The bottle is weighed before and after titration in order to determine the weight (instead of the volume) of the titrating solution used. **w. concentration.** The number of gm. of substance per kg. of solution. **w. normality.** Normality expressed per kg. instead of per liter.

weights. The units of weight in common use are:

A. METRIC WEIGHTS

Milli-gram	*Gram*	*Kilo-gram*	*Ton*	
1	0.001	10^{-6}	10^{-9}	0.015 grain
1000	1	0.001	10^{-6}	15.4 grains
10^6	1000	1	0.001	2.2 pounds
10^9	10^6	1000	1	1.1 ton

B. APOTHECARIES' WEIGHTS

Troy grains	*Scru-ples*	*Drams*	*Troy-ounces*	*Pound*	*Grams*
20	1	0.33	0.0417	0.00347	1.296
60	3	1	0.125	0.01042	3.888
480	24	8	1	0.833	31.035
5760	288	96	12	1	373.242

C. AVOIRDUPOIS WEIGHTS

Troy grains	*Drams*	*Ounces*	*Pound*	*Grams*
27.347	1	0.0625	0.0039	1.772
437.5	16	1	0.0625	28.35
7000	256	16	1	453.63

D. TROY WEIGHTS

Troy grains	*Penny-weights*	*Ounces*	*Pound*	*Grams*
24	1	0.05	0.0042	1.555
480	20	1	0.833	31.104
5760	240	12	1	373.2417

Weil-Felix reaction. An agglutination test for diagnosing typhoid fever.

weinschenkite. $(YEr)PO_4.2H_2O$. A native rare earth phosphate, resembling gypsum in structure.

weissite. Cu_2Te_2. Telluride. Lens-shaped crystals in veins of pyrites.

weld. To join metals by pressure at a temperature somewhat below that of complete fusion. **dyers-** A yellow dye obtained from *Reseda lutea*.

welding. (1) The joining of metals by heat; as: (a) **plastic-** united by pressure without a weld metal (forge, electrical resistance heater or thermite); (b) **fluid-** united by a weld metal without pressure (torch, arc or thermite). (2) To heat a metal to white heat and press the pieces together; or to heat a metal to fusion and let it flow into the joint. Cf. *thermite* process. **cold-** To hammer metal foils together into a compact piece; as, gold-foil restorations in dentistry. **spot-** Fluid welding at adjacent spots, which are subsequently run together by heat to form a continuous weld.

Weldon, Walter 1832–1885. An English industrial chemist, noted for his industrial processes. **W. process.** The manufacture of chlorine from hydrochloric acid by the action of manganese dioxide, and the regeneration of the W. mud by treatment with lime, followed by reoxidation to manganese dioxide. **W. mud.** The slime containing manganese and calcium manganites obtained in the Weldon process.

Welsbach, Carl Freiherr Auer von. 1858–1929. An Austrian chemist noted for his studies of the rare earths. **W. mantles.** Incandescent gas mantles, which consist of cellulose impregnated with cerium and thorium nitrates. On ignition a mixture of ceria (1 %) and thoria (99 %), remains.

Welter's rule. The heat of combustion of an organic compound is obtained approximately by subtracting the oxygen and hydrogen in the proportion of H_2O, and then adding the heats of combustion of the residual carbon and hydrogen atoms.

weltformat. A standard size for publications proposed by Ostwald, 16 × 22.6 cm. (about $6\frac{1}{4}$ × 9 inches, or the size of *Chemical Abstracts*).

welvic. Trade name for a polyvinyl type plastic.

Wenzel's law. Richter's law.

Werner, Alfred. 1866–1919. A Swiss chemist noted for his theories of the constitution of

Alfred Werner.

complex compounds; Nobel prize-winner (1923). **W.'s theory.** The affinity of an atom is an attractive force toward the center of the atom evenly distributed over its spherical shell. Valence numbers are the empirical numerical proportions in which atoms combine, and depend on the nature of the combining elements. In a combination of two atoms, the attractive force concentrates itself in a definite area, and this distribution is dependent on the nature of the combining atoms and may vary within wide limits. Thus, "in compounds such as H_2O and SO_2 the principal valencies of the atoms are saturated," and the molecules are incapable of uniting with another univalent atom. By reason of the residual valencies

however, the two molecules may combine, forming probably first an association held together by residual valencies: $O{=}S(=O)_2 \cdots\cdots (OH_2)$.

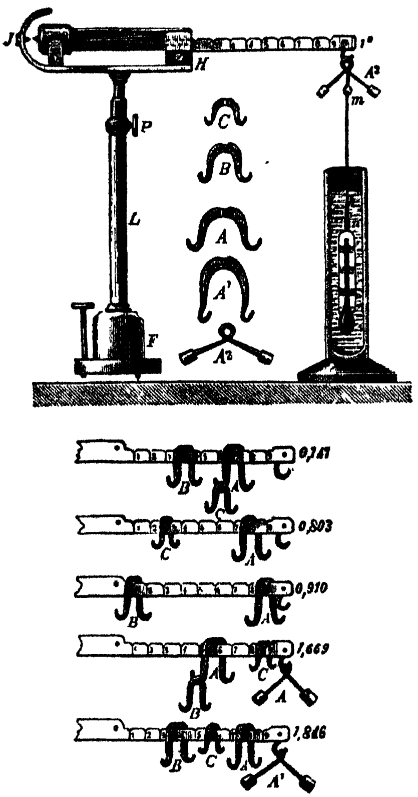
When association has occurred, the affinities may redistribute themselves uniformly with the formation of radicals (such as SO_4) having affinities capable of binding univalent atoms (such as 2H) to form H_2SO_4. Such hydrogen atoms exist outside the sphere of the complex radical SO_4, and are therefore easily split off in solution as ions. In this way *e.g.*, the curious behavior of the chlorine atoms in chloroplatinic acid, H_2PtCl_6, is explained." (Partington: "Inorganic Chemistry.") Cf. *coordination number, coordination hypothesis.*

wernerite. Scapolite.

Wesson tube. An absorption tube for carbon dioxide, containing soda-lime and calcium chloride.

West, Clarence Jay. 1886– . An American chemist noted for chemical literature.

Weston, Edward. 1850–1936. An English-born American electrical engineer. **W. normal cell.** Cadmium cell.



Westphal balance.

Westphal balance. A beam balance for determining the specific gravity of liquids and solids (see illustration).

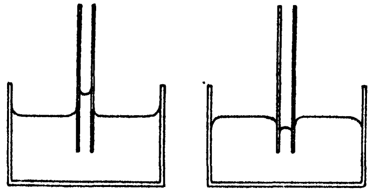
westron. Carbon tetrachloride.

wet. Moist. **w. analysis.** Qualitative analysis by means of reagents in solutions, as compared with dry, or blow-pipe, analysis. **w. bulb thermometer.** Psychrometer. **w. combustion.** A method of determining organic carbon with chromic acid, or other liquid reagents. **w. process.** An industrial method involving solutions; as, metallurgy, and the extraction of ores by acids or solvents.

wetness. See *freeness.*

wettability. The degree of wetting of a solid by a liquid, measured by the adhesion tension between a solid and liquid phase. Cf. *introfaction, zone.*

wetting. The adhesion of a liquid onto a surface. Cf. *flotation, adhesion, tension, introfier.*



A **B**

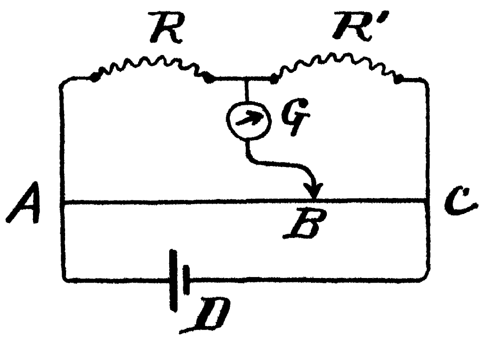
A = *Wetting* B = *Non-wetting*

whale. An aquatic ammal of the order *Cetaceae.* **w. bone.** Baleen. The horny, elastic substance from the upper jaw of the Greenland whale. **w. guano, w. meal.** A fertilizer made from dried and ground w. meat, containing 6–8 % N, 4–8 % P_2O_5. **w. oil.** Blubber oil. An oil from whales, d.0.92–0.93, used as a leather dressing, lubricant, illuminant, and for soap manufacture. **w. shot.** Crude spermaceti.

wheat. The seeds of *Triticum* species, Gramineae, used as food. The world output in 1941 was 183,000,000 long tons grown in U.S.S.R. > U. S. > China > Canada > India > Argentina > France and other countries. The chief varieties are:

T. monococcum	one-grained w.
T. polonicum	Polish w.
T. sativum	common w.
T. durum	flint w.
T. turgidum	rivet w.
T. compactum	dwarf w.

Wheatstone, Sir Charles. 1802–1875. An English physicist, noted for his electrical devices.



W. bridge. An instrument, for the measurement of electrical resistance (see diagram). A point *B* on the graduated resistance wire, *AC* is found such that no current flows through a galvanometer *G* from the accumulator *D.* The

ratio of the lengths *AB/BC* then equals the ratio of the resistances R/R', of which one is known. The other may then be calculated.

whey. Milk serum. The thin liquid remaining after the fat and casein have been removed from milk.

whisk(e)y. A grain spirit obtained from malted barley or other cereal by mashing and fermentation, followed by distillation and ageing.

white. A color (q.v.) produced by the reflection of all the visible rays, or of two complementary rays. **w. agate.** Chalcedony. **w. antimony.** Valentinite. **w. arsenic.** Arsenous oxide. **w. ash.** The dried bark of *Fraxinus americana*, an Oleaceae; used medicinally, as fluid extract. **w. bole.** Kaolin. **w. bryony.** Bryonia. The dried roots of *Bryonia alba;* used medicinally as a cathartic. **w. cedar.** Thuja. **w. coal.** Water power; power obtained from hydroelectric plants. **w. lead.** A basic lead carbonate, used as a white pigment. **e. lead ore.** Cerussite. **w. lead paper.** A filter paper impregnated with lead carbonate. **w. mustard.** Sinapis alba. **w. nickel ore.** $NiAs_2$. A native nickel arsenide. **w. oak.** Quercus. **w. olivine.** Forsterite. **w. pigments.** An opaque and colorless pigment; as, lead carbonate, sulfate or oxychloride, barium sulfate, zinc sulfide, kaolin, lithopone or titanium oxide. **w. pine.** Pinus alba. The dried bark of *Pinus strobus*, a Pinaceae; used medicinally as an expectorant. **w. pond lily.** The dried roots of *Castalia odorata*, a Salicaceae; used, as the fluid extract, as an astringent. **w. poplar.** The dried bark of *Populus tremuloides*, a Nymphaceae; used medicinally as a tonic and febrifuge. **w. precipitate.** Ammoniated mercury. **w. olivine.** Forsterite. **w. vitriol.** Zinc sulfate. **w. wash.** A suspension of chalk in water, used for decorative purposes. **w. zinc.** Zinc oxide.

whiting. Whitening. A washed chalk or calcium carbonate, used as a pigment for polishing.

whitlockite. $Ca_3(PO_4)_2$. A late hydrothermal mineral in New Hampshire granite pegmatites.

Whitney, Willis Rodney. 1868– . An American physicist, noted for his work on colloids.

whitneyite. Cu_9As. A native copper arsenide.

whortleberry. Vaccinium.

widia (from the German "*wie diamant*"). Cemented tungsten carbide.

Wiedemann, Gustaf Heinrich. 1828– . A German physical chemist, noted as editor of *Poggendorff's Annalen.* **W-Franz's law.** The *thermal* and *electrical* conductivities of the metals follow the same order.

Wieland, Heinrich. 1877– . A German chemist and Nobel Prize winner (1927), noted for biochemical research (bile acids, chlorophyll and hemoglobin).

Wien, Wilhelm. 1864–1928. A German physicist, noted for his research on spectra and radiations. **W. constant.** The constants, c_1 and c_2 in W.'s equation of radiation; $c_2 = 1.4312$. **W. equation.** The intensity, I, of a radiation is given by $I = c_1\lambda^{-5}.e^{c_2/\lambda T}$, where λ is the wave-length, and T the absolute temperature, e the base of natural logarithms and c_1, c_2 are constants. **W. law.** From a perfect radiator energy radiates over a wide range of temperature, but the intensity is a maximum for a certain wave-length, λ_m, depending upon the absolute temperature, T. Measured in centimeters, $\lambda_m = 0.289/T$; hence, the higher the temperature, the shorter is the wave-length of maximum intensity.

Wijs solution. A solution of iodine monochloride in glacial acetic acid; used for the determination of iodine values. **W. value.** Iodine number.

wild. (1) In pharmacy, not cultivated (plants); not domesticated (animals). (2) In metallurgy, over-oxidized; as, steel which will spit and fly owing to the escape of gases. **w. cherry.** Prunus virginianica. The stem bark of *Prunus serotina*, a Rosaceae; it is used medicinally, as the fluid extract, as a sedative and expectorant. **w. ginger.** Asarum. **w. hyssop.** Verbena. **w. indigo.** Baptisia. **w. licorice.** Abrus. **w. mint.** *Mentha canadensis*, a plant resembling pennyroyal. **w. rosemary.** q.v. **w. rue.** Harmel. **w. yam.** Dioscorea.

Wiley, Harvey Washington. 1844–1930. An American chemist, noted for his work on food laws.

Will, Heinrich. 1812–1890. A German chemist, noted for analytical methods.

willemite. Zn_2SiO_4. A native zinc silicate.

willesden goods. Articles made by impregnating paper or pulp in cupra-ammonium solution, washing, rolling, or pressing into a shape (*e.g.*, in several layers) and drying. They include small cheap articles such as picnic plates and spoons, combs, etc. and are hard and relatively water-resistant.

Williamson, Alexander Edward. 1824–1904. An English chemist, noted as founder of the molecule concept. **W. reaction.** The synthesis of ethers from sodium alcoholate and an alkyl-iodide: $RI + NaOR' \rightarrow ROR' + NaI$. **W.'s. violet.** $KFe[Fe(CN)_6].2H_2O$. A potassium ferric ferrous cyanide.

willow. A genus of trees of the order Salicaceae; the bark and leaves contain salicin.

Willstätter, Richard. 1872–1942. A German chemist and Nobel Prize winner (1925), noted for organic research particularly on plant pigments.

wilnite. A pale green variety of grossularite. See aluminum *garnet.*

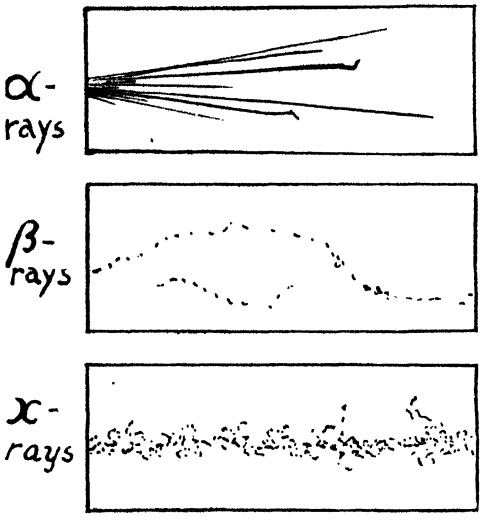
Wilson, Charles Thomas Rees. 1869– . An English physicist noted for his experimental methods of studying atomic effects. **W. method.** The fog condensation method which enables one to demonstrate and record the motions of atomic fragments by observing or photographing their path in a low-pressure fog chamber (the cloud-track apparatus). The charged ions or electrons cause condensation of the gaseous water molecules, and become visible as minute droplets. **W. tracks.** When α-, β-, γ- or x-rays are shot into a low-pressure fog chamber they cause condensation of single microscopic droplets, which appear as lines and can be photographed or kinematographed; used in the study of atomic structure (see illustrations).

winchester. A bottle of standard cylindrical shape, which is tall and has a relatively small base. **w. bushel.** See U.S.A. bushel. **w. quart.** A w. bottle which holds from 2¼ to 2½ liter.

wind gage. Anemometer.

Windaus, Adolf. 1876– . A German chemist, and Nobel Prize winner for his work on sterols.

window. An aperture in the glass of a vacuum tube which is closed with aluminum, or other metallic foil permitting the exit of cathode rays.



Wilson tracks.
Showing the path of nuclei, electrons and ions.

wine. Fermented grape juice, containing 6–22 % alcohol, traces of oenanthic and other ethers, essential oils, grape sugar, glycerol, tannic, malic, phosphoric and acetic acids, tartrates of potassium and calcium, coloring matters and some proteins. It is the result of the natural fermentation of grape juice, and exists in a great variety of types. **dry-** W. of low sugar content; as, Sauterne, Burgundy. **fortified-** W. to which alcohol has been added. **medicated-** W. to which a medicament (*e.g.*, meat extract) has been added. **sour-** W. which has begun to ferment to acetic acid. **spirit of-** Ethanol. **sweet-** W. of high sugar content; as, sherry or port.

wine-glass. An approximate liquid measure, equal to 60 cc. or 2 fluid ounces.

wing top. A triangular shaped attachment to the bunsen burner for producing a long and narrow flame.

Winkler, Clemens Alexander. (1838–1904). A German chemist, who discovered germanium and was noted for his work in gas analysis and mineralogical chemistry.

winterene. $C_{15}H_{24}$ = 204.2. A hydrocarbon found in the essential oil of winter's bark.

wintergreen. Gaultheria. **bitter-** Chimaphilia. **w. oil.** The essential oil of *Gaultheria* species, d.1.175–1.187, which contains 99 % methyl salicylate. *artificial-* Methylsalicylate.

winter's bark. The dried bark of *Drimys winteri*, a Magnoliaceae containing an essential oil, tannin and resin; used medicinally as an aromatic and stomachic. Cf. *drimin*.

wipla [from the German "*wie platin*"]. A chromium-nickel steel, used as a platinum substitute in dentistry.

wire. A metal or other rod drawn out to a high degree of fineness. **cross-** Two thin crossing wires placed in the objective of an optical instrument to enable the position of the object under examination to be fixed.

wiring. An electrical circuit.

Wislicenus, Johannes. 1835–1902. A German chemist noted for his work on stereochemistry, lactic acid and aceto-acetic ester isomerism.

wismuth. Bismuth.

wistarin. A crystalline glucoside from *Wistaria chinensis*, a Leguminosae.

witchhazel. Hamamelis.

withania. The plant *W. somnifera*, geneesblaar, vimba, a Solanaceae of South Africa, used by natives as an antiseptic and hypnotic. It contains somnirol, somnitol, withaniol, etc.

withanic acid. $C_{30}H_{46}O_8$ = 534.35. A monobasic acid from withania.

withaniol. $C_{35}H_{34}O_5$ = 534.25. A monohydric alcohol from withania.

witherite. $BaCO_3$. A native barium carbonate, d.4.29–4.35, hardness 3–3.75; used in the glass and sugar industries, and in pyrotechnics.

witness. A tube which usually contains calcium chloride and is placed at the beginning or end of a gas train; it is weighed at the beginning and end of the experiment, and indicates any loss of solvent sustained by the absorption bulbs (cf. *guard-tube*).

Friedrich Wöhler.
(From Muldoon "Organic Chemistry.")

Witt's color theory. Certain (chromophoric) linkages in organic compounds induce color. If a compound contains in addition certain other (auxochromic) linkages, a dyestuff is produced. A colored compound is known as a chromogen.

woad. An early dye made from the Cruciferae, *Isatis tinctoria*, of the Mediterranean region; its leaves are ground to a paste and fermented. Used as a blue dye before indigo was known in Europe, and the ancient Britons stained themselves with it.

Woestyn's law. Joule's Law.

wofatite. A German trade name for phenol-formaldehyde and amino plastics having exchange-adsorption properties (cf. *zeolites*). Used for water purification and the recovery of copper from waste cuprammonium liquors.

Wöhler, Friedrich. 1800–1882. A German chemist, noted for his isolation of aluminum and beryllium, discovery of isomerism and the first synthesis of an organic compound (urea) in 1828. **W.'s law.** A dynamic deformation of a

material may take place as a reults of vibrations, none of which attains the breaking limit; ultimately they may result in rupture.

wöhlerite. A native mixture of oxides of sodium, calcium, niobium, silicon and zirconium.

Wohl's reaction. Boiling with ammoniacal silver nitrate hydrolyzes acetyl groups and eliminates HCN from the oxime of an acetylated sugar:

$$R.CHOAc.CN \rightarrow R.CHOH.CN \rightarrow R.CHO + HCN.$$

Wohlwill process. The electrolytic refining of gold from a weak acid solution.

Wolf process. A flotation process involving the use of sulfo-chlorated oils.

Wolffram's salt. The platinum chloride, $[PtCl]Cl_2.(H_2O)_2$; used as microchemical reagent.

Wolf-Rayet type. A spectrum which shows wide emission lines; class O of stellar spectra, q.v.

wolfram. (1) Tungsten. (2) Wolframite. **w. ocher.** Tungstite.

wolframate. Tungstate.

wolframine. Tungstite.

wolframites. A group of iron and manganese tungstates of the general formula, $(Fe,Mn)WO_4$, intermediate between ferberite, $FeWO_4$, and hübernite, $MnWO_4$.

wolframium. Tungsten.

wolfsbane. (1) See *arnica flowers*.

wolfsbergite. (1) Chalcostibite. (2) Essonite.

Wollaston, William. 1766–1828. An English physicist and chemist who discovered palladium and rhodium, and investigated the wave-theory of light. **W. wires.** Fine platinum wires (0.001 mm. diameter) drawn inside a silver sheath, which is subsequently removed in nitric acid.

wollastonite. $CaSiO_3$. Tabular spar, scale stone. A native triclinic calcium silicate of the pyroxene group. **para-** The monoclinic form of w. **pseudo-** A third modification of w.

Wolpert's air tester. See *air tester*.

wondrpack. An oral surgical dressing: 70 % zinc oxide, 30 % rosin and 0.625 % asbestos, made into a paste with 80 % oil of cloves and 20 % olive oil.

wood. The dried stem or the structural and supporting part of a tree or shrub. Its chief constituent is cellulose, cf. *lignin, lignoceric acid, lignone, lignose, xylose*. The following woods are official (U.S.P.):

Dulcamara	Quassia
Guaiacum	Red Sanders
Hematoxylon	

Commercial woods may be classified:

Soft woods:

Pine	*Pinus* species
Spruce	*Picea* species
Hemlock	*Tsuga* species
Fir	*Abies* species
Redwood	*Sequoia sempervirens*
Cedar	*Thuja* and *juniperus* species

Hard woods:

Poplar	*Populus* species
Oak	*Quercus* species
Linden	*Tilia* species
Maple	*Acer* species
Birch	*Betula* species
Sycamore	*Plantans* and *Acer* species
Beech	*Fagus* species
Chestnut	*Castanea* species
Walnut	*Juglans* species
Ash	*Fraxinus* species
Hickory	*Hicoria* or *Carya* species
Elm	*Ulmus* species

Cabinet woods:

Mahogany	*Khaya* species
Teak	*Tectona grandis*
Ebony	*Diospyros* species
Rosewood	*Dalbergia* species

w. alcohol. Methanol. **w. ashes.** The residue remaining from burning wood, and containing 4 % K_2O; used as fertilizer. **w. cellulose.** Xylon. Cellulose obtained from wood. **w. charcoal.** Carbo lignis. **w. extract.** The waste liquor from the cooking of wood with alkali or sulfite liquor to make pulp. **w. flour.** W. meal, sawdust, pulverized w. A finely-powdered wood, generally white pine. Used as a filler in moldings, linoleum, flooring, rubber, soap, and as absorbent for nitroglycerin (dynamite). **w. free.** Describing a paper which contains no groundwood pulp, and which usually contains only chemical wood pulp. **w. march.** Sanicula. **w. meal.** W. flour. **w. metal.** See *Wood's alloy*. **w. naphtha.** Methanol. **w. oil.** Tung oil. **w. opal.** Xylopal. Fossilized wood, in which silica replaces the woody fibers. **w. preservative.** A preparation (*e.g.*, tar or creosote) to make w. withstand the effects of moisture and bacteria. **w. pulp.** (Cf. *wood flour, pulpwood*.) A mechanically-ground or chemically-digested wood used in the manufacture of paper or rayon. **w. spirit.** Methanol. **w. stain.** See *table top impregnation*. **w. stone.** Xylolith. **w. sugar.** Xylose. **w. tar.** See *tar*. **w. vinegar.** See *pyroligneous acid*. **w. waste.** The materials made from lumber-"waste," such as

wood pulp (for paper, twine, yarn, rayon),
wood flour (dynamite, linoleum, plastics),
ethyl alcohol, motor fuels,
cattle food and carbohydrates
rosins, turpentine, pine oil and tar
tannin, fatty acids, dyes and potash.

Wood's alloy. A low melting-point alloy (65.5°C); 5 pts. bismuth, 2.5 pts. lead, 1.25 pts. tin and 1.25 pts. cadmium. **W. glass.** A glass which absorbs most of the visible spectrum, but transmits a band of waves in the ultra-violet. **W. light.** The filtered rays of the mercury vapor lamp of wave-length 3340–3906 A.U.

woodwardite. $CuSO_4,Al_2(SO_4)_2,H_2O$. Native copper aluminum sulfate.

wool. The fibrous hair of lambs and sheep. It contains keratin (which has a characteristic odor on burning), and about 40 % of a grease (chiefly cholesterol). It is similar in composition to horn, and is attacked by alkali, but not by acids. **casein-** Lanital. **glass-** Fine glass threads used for filtering. **mineral-** See *mineral*. **w. fat.** (1) Lanolin. (2) The wax alcohol extracted from pure wool fat on the commercia scale. **w. waste.** A fertilizer material and by-product of w. carding, consisting of sheep manure, seeds and wool fibers, 3–6 % N_2.

Woolwich viscosity. See *viscosity*.

woorara. Curare.

work. Work is performed when a force moves its point of application. It is measured by the product of the force and the distance it is displaced in the direction of the force. Units: F.P.S. system—1 foot-pound, *i.e.*, the work done when 1 pound is lifted one foot against gravity.

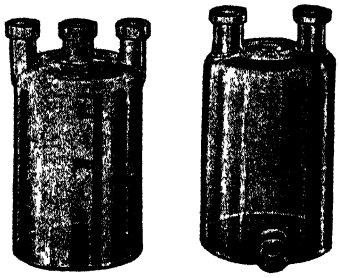
Metric system—1 centimeter-dyne = 1 erg. Gravitational unit—1 gram and 1 cm. = g. dyne cms. = g. ergs. Dimensions—FL = ML^2T^{-2}. For rate of work, see *power*. **w. of expansion.** The resistance offered by the molecules of an expanding gas, due to molecular attraction.

wormseed. (1) Santonica. (2) Chenopodium. **w. oil.** *American:* The essential oil from *Chenopodium ambrosioides*, d.0.960–0.980. *Levant:* The oil of *Artemisia maritima*, d.0.930, containing cineol.

wormwood. Absinthium. **salt of-** Potassium carbonate. **w. oil.** Absinthe oil. An essential oil from the herb of *Artemisia absinthium*. A greenish volatile liquid, d.0.925–0.955, soluble in alcohol, containing chiefly thujone, phenandrene and thujyl alcohol.

wort. Any infusion of a plant or part of a plant that is to be fermented; as beer-wort.

Woulfe bottle. A two or three-necked bottle which is used frequently in chemical experiments. It was first described by Peter Woulfe in 1784.



Woulfe bottles.

W-rays. See *W*.

Wright's stain. A microscope stain for white blood corpuscles, consisting of 1 gram of specially prepared methylene-blue-eosine mixture in 600 cc. of methanol.

wrightine. Conessine.

Wroblewski, Sigismund A. von. 1845–1888. A Polish physicist, noted for the liquefaction of gases.

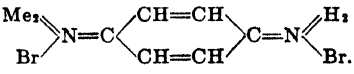
wrought iron. A pure grade of iron with a low carbon content.

Wu, Lu-Chiang. 1904–1936. A Chinese chemist, noted for historical research.

wulfenite. $PbMoO_4$. Yellow lead ore. A native lead molybdate.

Wullner's law. The lowering of the vapor pressure of water by a solute is proportional to the concentration of the solute.

Wurster's blue. An oxidation-product of tetramethyl-*p*-phenylene diamine; used as an indicator. **W. red.** An oxidation-product of *p*-amino-dimethylaniline. It is considered to be a meriquinone:



Würtz, Carl Adolphe. 1817–1884. A French chemist, noted for organic research and his statement *"La Chimie est une science française."* **W. flask.** A distillation flask with a side-arm in the neck. **W.'s reaction.** The synthesis of hydrocarbons by treating alkyl iodides in ethereal solution with sodium: 2MeI + 2Na = Me.Me + 2NaI.

wurtzite. ZnS. Aegerite. A native zinc sulfide, differing from sphalerite in its hexagonal structure.

wyomingite. A porous rock found in the Leucite Hills, Southern Wyoming, from which potash is extracted by acid treatment. It contains 11 % K_2O.

Wysor machine. A device for grinding and polishing metals for metallographic examinations.

X

X. (1) The symbol for xenon. (2) In a formula: the symbol for a halogen or acid radical, as HX.

x. The symbol for: (1) an unknown quantity; (2) molecular fraction. **x-axis.** The first dimension in coordinates, q.v. **x-ray.** See below. **x-unit.** See below.

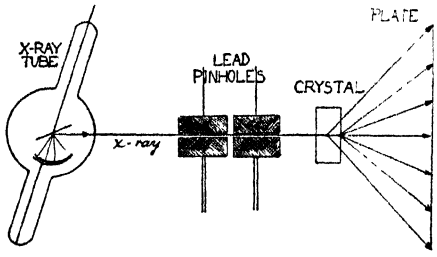
χ. The Greek letter "chi."

ξ. The Greek letter "xi."

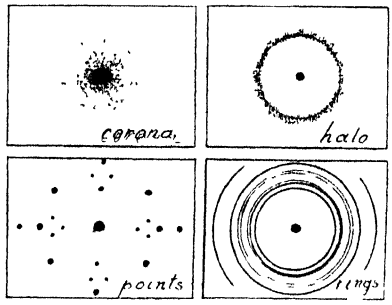
x-rays. Röntgen rays. A non-luminous radiation (q.v.) or invisible light rays of extremely short wave-lengths, ranging from 0.06 to 2 Å.U., which are produced in an x-ray tube (q.v.) by cathode rays focused upon a metal surface. They resemble the gamma-rays of radioactive substances, and are made visible by fluorescent screens or photographic plates. Their *quantity* is determined with Eder's solution; their *intensity* is expressed in Röntgen units. Cf. *spectrum, radiations.* **hard-** X-rays of relatively high penetration and short wave-length, 0.19 to 0.43 Å.U., which decrease in wave-length as they traverse a medium. **heterogeneous-** See *multifrequent-.* **homogeneous-** See *monochromatic-.* **infra-** Grenz rays. **monochromatic-** Unifrequent-, homogeneous-. X-rays consisting of rays of a single wave-length or a group of wave-lengths, depending upon the nature of the target. The shortest measured is 0.1075 Å.U. for the K-line of uranium; the longest 17.66 Å.U. for the $L\beta$ line of iron. **multifrequent-** Heterogenous-, polychromatic. X-rays consisting of rays of many different wave-lengths. **polychromatic-** Multifrequent-. **soft-** X-rays of relatively low penetration and long wave-length, 11.9 to 13.6 Å.U., which increase in wave-length as they traverse a medium. **ultra-** Cosmic rays. **unifrequent-** Monochromatic-. **white-** The common or ordinary x-rays, consisting of a band of many different wave-lengths. Their limit depends on the voltage applied, and not on the nature of the target: $Ve = h\nu_0 = hc/\lambda_0$, where V is the voltage, e the charge of an electron, h Planck's constant, c the velocity of light, λ_0 the maximum frequency and ν_0 the minimum wave-length.

Type of x-rays	Average λ Å.U.	Voltage KV.
high voltage.....	0.04	550
hard-.....	0.20	180
medium-.....	0.50	70
soft-.....	0.70	50
grenz rays.....	2.0	2.5

x-ray analysis. The determination of the internal structure of a material by means of the diffraction pattern formed when an x-ray passes through it (see illustrations):



X-ray analysis.



X-ray analysis pattern.

corona or diffuse fog, indicating the gaseous state.

halo, indicating a liquid or an amorphous substance, where the molecules are distributed in irregular or haphazard fashion (*e.g.*, unstretched rubber).

rings, indicating a regular space lattice with the molecules in definite positions and oriented to each other (*e.g.*, stretched rubber).

points, indicating a crystal, or regular space lattice in which the atoms, ions or molecules are fixed in definite positions.

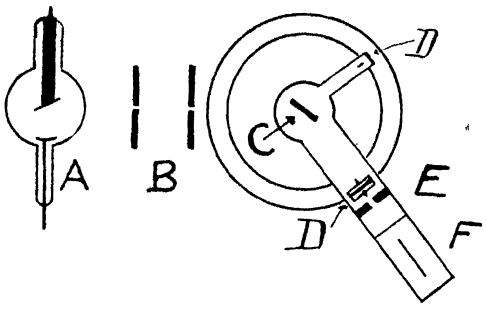
x-ray intensity unit. (International standard, 1928.) The Röntgen (r). The quantity of x-radiations which, when the secondary electrons are fully utilized and the wall-effect of the chamber avoided, produces in 1 cc. of atmospheric air at 0°C. and 760 mm. pressure, such a degree of conductivity that one e.s.u. charge is measured at saturation current.

x-ray spectrogram. A photographic record produced by the spectrograph; as, a crystallogram, q.v.

x-ray spectrograph. A spectrometer fitted with a photographic camera.

x-ray spectrometer. An arrangement for diffracting x-rays by using the space-lattice of a crystal as grating (see illustration).

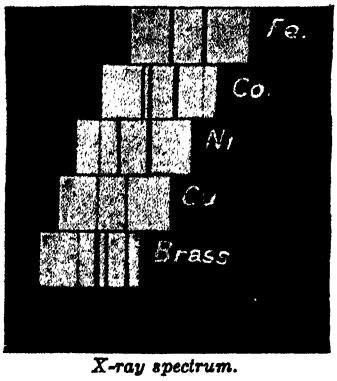
x-ray spectrum. Moseley spectrum, high-frequency spectrum. The spectrum produced (by a crystal diffraction grating) of the characteristic radiations emitted by the metal used as anticathode in an x-ray tube. Each metal produces a few, strong, characteristic lines,



X-ray spectrometer.

A—x-ray tube
B—lead slits
C—crystal
D—scale
E—lead slit
F—ionization chamber or photographic plate.

(see illustration) the square roots of the frequencies of which are in direct proportion to the atomic number of the element. It is used as a means of analysis.



X-ray spectrum.

x-ray structure. The structural arrangement of atoms in a crystal as revealed by the Laue pattern and crystallograms (q.v.) produced when x-rays pass through the crystal and fall on a photographic plate.

x-ray tube. A cathode tube or highly-evacuated tube containing three electrodes; namely, a disk concentric with the tube as cathode, a heavy, substantial and inclined plane of high melting-point metal as an anticathode, and a small wire as an anode (see illustration). The cathode rays concentrate on a small spot on the anticathode, which is heated by the bombardment of electrons and emits rays of very short wave-lengths.

x-unit. (1) A wave-length of 10^{-3} Å.U. (10^{-11} cm.). (2) More accurately, 1 x-unit = 1.00201×10^{-3} Å.U. (Craven).

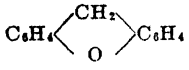
xanthaline. $C_{37}H_{36}O_9N_2$ = 652.4. An alkaloid, m.208, in opium.

xanthate. Xanthogenate. A salt of xanthic acid of the general type, EtO.CS.SM, or RO.CSSM, where M is a metal and R an alkyl radical; as, potassium ethylxanthate, EtO.CS.SK. Cf. *viscose.* **butyl-** Potassium *sec.*-butylxanthate, $MeCH_2.CHMeO.CS.SK$. An agent used in flotation as collector, giving 94 % mineral recovery. **ethyl-** Potassium ethyl xanthate, EtO.CS.SK. Used as a collector in flotation; 85 % of mineral recovery results. **propyl-** $MeCH_2CH_2O.CS.SK$. A flotation collector giving 90 % mineral recovery.

xanthein. A yellow coloring matter of plants, and a split-product of chlorophyll.

xanthematin. A yellow coloring matter and split-product of hemoglobin.

xanthene. $C_{13}H_{10}O$ = 182.1. Methylenediphenyleneoxide, dibenzo-*1.4*-pyran, diphenylenemethaneoxide,



Colorless leaflets, m.105, b.312; very slightly soluble in water, soluble in alcohol or ether. Cf. *xanthydrol.* **benzo-** See *benzoxanthene.* **dibenzo-** See *dibenzoxanthene.* **hydroxy-** Xanthydrol. **keto-** Xanthone. **thio-** Thioxanthene.

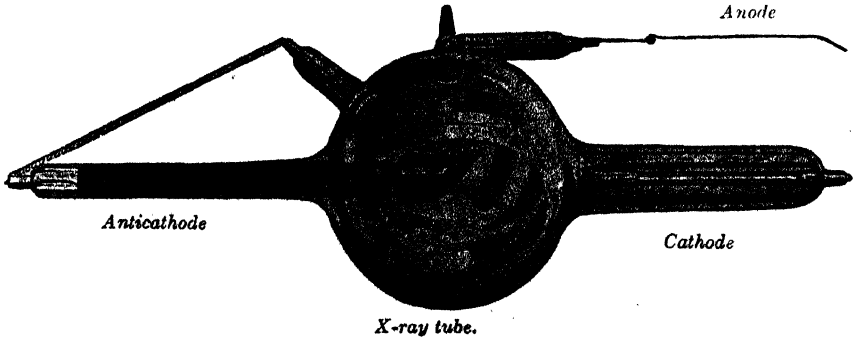
xanthenol. Xanthydrol.

xanthenone. Xanthone.

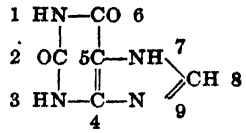
xanthic acid. $C_3H_6OS_2$ = 122.18. Xanthonic acid, xanthogenic acid, ethyloxydithiocarbonic acid, HO.CS.SEt or EtO.CS.SH. A very unstable, colorless, oily liquid, insoluble in water, decomp. to ethanol and carbon disulfide at 24°C. **x. amide.** C_3H_7ONS = 105.14. $NH_2.CS.OEt$, m.38, soluble in water, alcohol or ether. **x. disulfide.** $C_2H_2S_4O_2$ = 186.3. HO.CS.S.S.CS.OH. Colorless crystals, m.28.

-xanthin. A suffix indicating yellow; as, cox., fucox., tarax., violax., and zeax.

xanthin(e). $C_5H_4O_2N_4$ = 152.1. 2.6-Dioxypurine, 2,6-purinedione. A purine base in blood, liver, urine and some plants. A yellow crystalline powder, m.360, slightly soluble in water or alcohol, and soluble in ether. **allo-** Alloxantin. **dimethyl- 1.3-** Theophyl-



X-ray tube.



line. **3.7- Theobromine.** **1.7- Paraxanthine.** **hetero-** $C_6H_6O_2N_4$ = 166.1. 7-Methyl-2.6-dioxypurine. **hypo-** $C_5H_4ON_4$ = 136.1. 6-Oxypurine. **imido-** Guanine. **methyl-** $C_6H_6O_2N_4$ = 166.1. 1-Methyl-2.6-dioxypurine. **para-** $C_7H_8O_2N_4$ = 196.2. 1.7-Dimethyl-2.6-dioxypurine, an isomer of theophylline. **pseudo-** Tauto-. **tauto-** $C_5H_4O_2N_4$ = 152.1. Pseudoxanthine. 2.6-Dihydroxypurine. A tautomeric form of **xanthine.** **tautohypo-** $C_5H_4ON_4$ = 136.1. A tautomeric form of hypoxanthine, q.v. **trimethyl-** Caffeine.

x. bases. Alloxuric bases, purines. A group of oxypurine derivatives in vegetable and animal tissues, *e.g.*, xanthine, hypoxanthine, uric acid, carnine, theophylline, caffeine, theobromine.

xanthinine. $C_4H_3O_2N_3$ = 125.05. A compound formed by heating ammonium thiourate.

xanthium. Spiny clotbur, cocklebur. The herb of *Xanthium spinosum*, a Compositae, containing essential oils and resins; used medicinally as a diuretic. *Cf. xanthostrumarin.*

xantho- A prefix derived from the Greek "yellow," indicating a yellow color of the compound; as in xanthocobaltic.

xanthochelidonic acid. $C_7H_8O_7$ = 202.0. Acetone dioxalic acid. *2.4.6*-Dioxypimelic acid, *2.4.6*-triketopimelic acid, *2.4.6*-triketoheptanedioic acid, $CO(CH_2.CO.COOH)_2$. An unstable acid formed from chelidonic acid by treatment with excess alkali. Its salts are yellow.

xanthochromium. The divalent group $Cr(NO_2)(NH_3)_5$ which forms salts:

x. bromide	$Cr(NO_2)(NH_3)_5Br_2$
x. carbonate	$Cr(NO_2)(NH_3)_5CO_3$
x. chloride	$Cr(NO_2)(NH_3)_5Cl_2$

The xanthochromates are usually soluble in water.

xanthocobaltic. The divalent group, $Co(NO_2)(NH_3)_5$, which forms yellow salts:

x. bromide	$Co(NO_2)(NH_3)_5Br_2$
x. chloride	$Co(NO_2)(NH_3)_5Cl_2$
x. chromate	$Co(NO_2)(NH_3)_5CrO_4$

The xanthocobaltates are usually soluble in water.

xanthocreatinine. $C_6H_{10}ON_4$ = 142.1. A yellow crystalline leukomaine resembling creatinine, in muscle tissues.

xanthogenate. A compound of the type $(RO.CS.S—)_2$. **diethyl-** $C_6H_{10}O_2S_4$ = 242.32. Bisethylxanthogene. EtO.CS.S—S.CS.OEt. A yellow liquid, b.92, used in oil solutions as an antiparasitic.

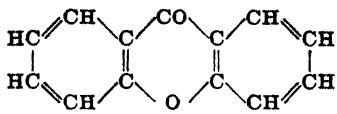
xanthogene. A coloring material of plants, producing a yellow pigment with alkalis.

xanthogenic acid. Xanthic acid.

xanthoglobulin. Hypoxanthine.

xantholine. Santonica.

xanthone. $C_{13}H_8O_2$ = 196.1. Xanthene-ketone, ketodiphenyleneoxide, dibenzo-γ-pyrone xanthenone, 9-ketoxanthene. Colorless crystals, m.173, b.$_{730mm}$.350; slightly soluble in water



or alcohol, soluble in ether. It is the nucleus of certain plant pigments; used in the synthesis of dyes (*e.g.*, euxanthone, India yellow). **dihydroxy- 1.7-** Euxanthone. **3.8- Isoeuxanthone.** **methoxydihydroxy-** Gentisin. **naphtho-** Naphthoxanthone. **thio-** See *thioxanthone*, **trihydroxy-** Gentisein.

xanthonic acid. Xanthic acid.

xanthophyll. $C_{40}H_{56}O_2$ = 568.4. A yellow vegetable pigment, m.192, similar to chlorophyll, which occurs in plants. It is a polymer of isoprene and related to carotene, q.v.

xanthophyllite. A native hydrous silicate of calcium, magnesium, iron and aluminum.

xanthopicrin. A yellow coloring matter from the bark of *Xanthoxylum cariboeum*, a Rutaceae.

xanthopicrite. A yellow resin from *Xanthoxylum* species.

xanthoprotein reaction. A reaction for proteins, in which a yellow substance is produced by boiling with nitric acid.

xanthopterin. The yellow pigment from the wings of the "brimstone" butterfly; family, *Pieridae.*

xanthopuccine. An alkaloid isolated from *Hydrastis canadensis.* Cf. *hydrastis.*

xanthopurpurin. $C_{14}H_8O_2(OH)_2$ = 240.13. 1.3-Dihydroxy anthraquinone, purpuroxanthene. A solid, m.263, soluble in alcohol.

xanthorhamnin. A glucoside and hydroxyflavone from buckthorn berries, *Rhamnus cathartica.* Cf. *rhamnoxanthin.*

xanthorhodium. The divalent group $Rh(NO_2)(NH_3)_5$, which forms a series of yellow salts:

x. bromide	$Rh(NO_2)(NH_3)_5Br_2$
x. chloride	$Rh(NO_2)(NH_3)_5Cl_2$
x. hydroxide	$Rh(NO_2)(NH_3)_5(OH)_2$

xanthorrhiza. Yellow root. The dried rhizome of *X. apiifolia*, a Ranunculaceae; used medicinally as a bitter tonic.

xanthosiderite. $Fe_2O_3.2H_2O$. A hydrated ferric oxide. Fine, yellow, stellate needles.

xanthosin. $C_{10}H_{10}N_4O_6$ = 268.14. Xanthinriboside produced from guanosin by deamination.

xanthostrumarin. A glucoside from *Xanthium strumarium*, cocklebur, a Compositae. Cf. *xanthium.*

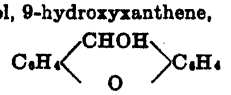
xanthoxylene. $C_{10}H_{16}$ = 136.1. **Xanthoxylin.** A terpene from the essential oil of *Xanthoxylum* species (Rutaceae).

xanthoxylin. (1) An alcoholic extract of xanthoxylum. (2) Xanthoxylene.

xanthoxylone. $C_{10}H_{12}O_4$ = 196.1. A crystalline principle from *Xanthoxylum.*

xanthoxylum. Prickly ash, yellow wood, angelica tree. The dried bark of *X. americanum*, *X. officinalis* (Rutaceae) or other species, containing xanthoxylene, essential oils, tannin and resin. Used medicinally, as fluid extract, as a diaphoretic and stimulant. Cf. *angelica tree, artar root.*

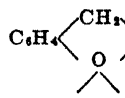
xanthydrol. $C_{13}H_{10}O_2$ = 198.08. Diphenyleneoxycarbinol, 9-hydroxyxanthene,



Used as a reagent for urea. Cf. *xanthene.*

xanthyl. The monovalent radical, $C_{13}H_9O$—, derived from xanthene. There are five isomers.

xanthylium. The radical



containing tetravalent oxygen; derived from xanthene.

xaxa. Acetylsalicylic acid.

xaxaquin. Quinine acetyl salicylate.

xble. Abbreviation for crucible.

xe. An obsolete symbol for xenon, X.

xenene. Biphenyl.

xenol. $C_{12}H_{10}O$ = 170.1. Xenenol, phenylphenol, PhC_6H_4OH. **o-** White solid, used as an antiseptic. **p-** White solid, used in the plastics industry to increase resistance to high temperatures and hot water.

xenolite. An aluminum silicate resembling fibrolite.

xenon. X or Xe = 131.3. A rare, heavy noble gas and element, atomic number 54; discovered by Ramsay and Travers, 1898, and named from the Greek, *ξενος*, strange. It occurs in small traces in the atmosphere (5/100,000 %), and consists of nine isotopes. A colorless gas, $d._{(air=1)}$4.422, $d._{(gas/liquid)}$5.887, m. −140, b. −107.1, triple point at −111.5°C and 600 mm.; insoluble in water and used in vacuum tubes.

Xenophanes. B.C. 576–480. A Greek philosopher of the Eleatic school, who suggested one of the earliest known theories of atomic structure which he believed to be continuous and completely filling space.

xenotime. YPO_4. A native yttrium phosphate, containing uranium and rare earth metals.

xenyl. The monovalent radical, PhC_6H_4— derived from diphenyl.

x. amine. $C_{12}H_{11}N$ = 169.1. *p*-Biphenylamine, *p*-phenylaniline, martylamine, $PhC_6H_4NH_2$, commercial aniline. White leaflets, d.1.160, m.53, b.302. Cf. *diphenylamine.*

xeroform. $Bi_2O_2(C_6H_2Br_3OH)$ = 796.8. Bismuth tribromphenol, bismuth tribromcarbolate. A yellowish-green powder, insoluble in water; used medicinally as an intestinal antiseptic and iodoform substitute.

xi. The Greek letter ξ or Ξ.

xiphidin. A ptomaine from the sperm of the sword fish, containing 81.5 % arginine.

xonotlite. $5CaO.5SiO_2.H_2O$. A constituent of boiler scales having a fibrous structure.

xray. See *x-ray.*

xylan. A hemicellulose in many trees and industrial wastes; *e.g.*, cotton seed hulls, corn cobs, corn stalks, peanut shells. On hydrolysis with sulfuric acid it yields xylose, q.v.

xylanbassoric acid. $C_{18}H_{28}O_{17}$ = 528.22. A hydrolysis-product of bassorin from gum tragacanth; soluble in cold water, hydrolysed to xylose.

xylene. C_8H_{10} = 106.12. Dimethylbenzene*, xylol, $C_6H_4Me_2$. **ortho-** or 1.2- A colorless liquid, d.0.881, m. −28, b.144.2; insoluble in water, soluble in alcohol or ether. **meta-** or 1.3- A colorless liquid, d.0.866, m. −54, b.139; insoluble in water, soluble in alcohol or ether. **para-** or 1.4- Colorless monoclinic crystals, m.15, b.135, insoluble in water, soluble in alcohol or ether. A mixture of all three hydrocarbons ("xylol") is used in microscopy as a solvent.

bromo- $Me_2C_6H_3Br$ = 184.99. Cf. *xylylbromide.* **4-*o*-** Liquid, d.1.369, m.0, b.214. **2-*m*-** Liquid, m. −10, b 206, **4-*m*-** b.207. **5-*m*-** b.204. **2-*p*-** d.1.356, b.206. **dihydroxy-** Xylenediol. **ethyl-** Dimethyl-ethyl*benzene.* **hydroxy-** Xylenol. **nitro-** See *nitroxylene.*

x. sulfonic acid. $C_8H_{10}O_3S$ = 186.18. (1.2.-4.)-$C_6H_2Me_2.SO_3H$. A liquid, b.19.

xylenediol. $C_8H_{10}O_2$ = 138.1. Xylylene alcohol, xylylol, phenyl-dicarbinol, benzene dicarbinol, $C_6H_4(CH_2OH)_2$. **ortho-** or α,α'-o-, or phthalyl alcohol. A solid, m.62. **meta-** or α.α'-m-, m.46. **para-** or α,α'-p-, or terephthalyl alcohol, m.112. They are used in organic synthesis.

xylenol. $C_8H_{10}O$ = 122.1. A group of dimethylphenols or hydroxy-dimethylbenzenes, $C_6H_3Me_2OH$. In the following list the first two numbers indicate the position of the two methyl groups; the third number that of the hydroxyl group; the boldface numbers refer to the methyl groups, assuming OH at position 1:

1.2.3- or **2.3**-	m.75, b.218
1.2.4- or **3.4**-	m.65, b.225
1.3.2- or **2.6**-	m.49, b.211
1.3.4- or **2.4**-	m.26, b.211
1.3.5- or **3.5**-	m.64,'b.219
1.4.2- or **2.5**-	m.74, b.211

Colorless crystalline powders; soluble in water or alcohol to varying extents.

xylenol blue. 1,4-Dimethyl-5-hydroxy benzene sulfonphthalein. An indicator used in biochemical work, which changes from red (pH = 1.2) to yellow (pH = 2.8), and from yellow (pH = 8.0) to blue (pH = 9.6).

xylic acid. $C_9H_{10}O_2$ = 150.13. Methyltoluic acid, dimethylbenzoic acid. $Me_2C_6H_3COOH$. Six isomers:

2, 3- or α-hemellitic acid	m.144
2, 4-	m.126
2, 5- or p- or *iso*xylic	m.132
2, 6- or v-	m.116
3, 4- or a-	m.165
3, 5- or mesitylinic acid	m.167

xylidene. Xylidine.

xylidic acid. $C_9H_8O_4$ = 180.1. 4-Methylisophthalic acid. The dibasic acid, $C_6H_3Me(COOH)_2$. **1.2.5.**- Colorless crystals, m.282. **1.2.4.**- Colorless crystals, m.325 (sublimes). **1.2.3**- Colorless crystals, m.144 (decomp.). Cf. *uvitic acid.*

xylidine. $C_8H_{11}N$ = 121.1. Xylidene. Methyltoluidines, dimethylanilines, aminoxylenes, $C_6H_3Me_2NH_2$. A group of aniline homologs in technical xylidine; used in the synthesis of dyes. In the following list, the first two numbers refer to the position of the methyl group; the third to that of the amino radical.

1.2.3- Liquid, d.0.991, m. −15, b.224
1.2.4- Crystals, d.1.076, m.49, b.225
1.3.2- Liquid, d.0.980, b.216
1.3.4- Liquid, d.0.990, b.212
1.3.5- Liquid, d.0.993, b.220
1.4.3- Liquid, m.15, b.217

They are slightly soluble in water, soluble in alcohol or ether.

xylidinic acid. Xylidic acid.

xylite. Xylitol.

xylitol. $C_5H_{12}O_5$ = 152.1. Xylite. The pentahydric alcohols derived from xylose, $CH_2OH(CHOH)_3CH_2OH$.

xylo- A prefix derived from the Greek "wood," and indicating a relation to wood.

xylochloral. A compound of chloral and xylose; colorless scales, m.132. Used medicinally as a hypnotic.

xyloidine. $C_6H_9O_5(NO_3)$ = 207.1. An explosive substance obtained by the action of nitric acid on starch or woody fibers.

xyloketose. $C_5H_{10}O_5$ = 150.1. A pentose-ketose corresponding with xylose and lyxose.

xylol. A mixture of xylenes, q.v.

xylolith. Wood-stone. A mixture of magnesia, magnesium chloride and sawdust which, on moistening, dries to an extremely hard mass; used for floors or laboratory tables.

xylon. Wood-cellulose.

xylonic acid. $C_5H_{10}O_6$ = 166.1. A monobasic acid, $CH_2OH(CHOH)_3COOH$, obtained by oxidation of xylose. Cf. *pentonic acid.*

xylonite. Celluloid.

xylonitrile. C_9H_9N = 131.08. Dimethylbenzonitrile. $Me_2C_6H_3CN$.

xylopal. Wood opal.

xyloquinone. $C_8H_8O_2$ = 136.1. Dimethylquinone. $C_6H_2Me_2O_2$, a homolog of quinol. **2.3-** A soluble solid, m.55 (sublimes). **2.6-** A soluble solid, m.72. **2.5-** A soluble solid, m.61 (sublimes). **3.5-** Phlorone.

xylorcinol. $C_8H_{10}O_2$ = 138.1. **1.3.4.6-** Dimethylresorcinol, methylorcinol. $C_6H_2Me_2(OH)_2$, a homolog of orcinol. White crystals, soluble in water, alcohol or ether, m.124, b.278.

xylose. $C_5H_{10}O_5$ = 150.1. Wood sugar. The pentose, $CH_2OH(CHOH)_3CHO$, obtained from xylan, straw or other vegetable fibers by heating with sulfuric acid. A colorless crystalline powder, m.140, soluble in water, slightly soluble in alcohol or ether; used in tanning, dyeing and as a diabetic food. Cf. *xylan, xylonic acid.*

xylosic acid. $C_5H_8O_6$ = 164.1. The aldehyde-acid, $CHO.(CHOH)_3COOH$, derived from xylose.

xylostein. A poisonous glucoside from the fruit of *Lonicera xylosteum*, a Caprifoliaceae and variety of honeysuckle.

xyloyl. The monovalent radical, $Me_2C_6H_3CO$—, derived from xylic acid; 7 isomers.

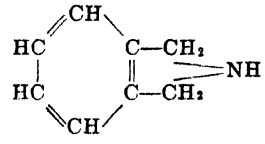
xylyl. (1) The monovalent radical, $CH_3C_6H_4CH_2$—, derived from xylene. It occurs in o-, m-, and p-types. (2) Dimethyl-phenyl. The monovalent radical, $Me_2C_6H_3$—. Cf. *tolyl.*

x. alcohol. (1) Xylenediol. (2) Tolyl carbinol. **x. bromides:** C_8H_9Br = 184.99. $MeC_6H_4CH_2Br$. Cf. bromo*xylene.* **o-** A solid, m.21, b.217.7. **m-** A liquid, d.1.371, b.215. **p-** A solid, d.1.324, m.38, b.221. The mixed isomers are a lachrymatory poison gas (T-stoff). **x. chloride.** C_8H_9Cl = 140.6. Monochlorxylene, tolylchloride, $CH_3.C_6H_4.CH_2Cl$. *ortho-* A colorless liquid, b.197; insoluble in water, soluble in alcohol or ether. *meta-* A colorless liquid, b.195; insoluble in water, soluble in alcohol or ether. *para-* A colorless liquid, b.192; insoluble in water, soluble in alcohol or ether. **x. hydrazine.** $C_8H_{12}N_2$ = 136.1. $C_6H_3Me_2NH.NH_2$. Colorless crystalline needles, m.85, soluble in ether.

xylylene. The divalent radical, $—CH_2.C_6H_4.CH_2—$, derived from xylene, in o-, m-, and p-types.

x. alcohol. Xylenediol. **x. amine.** X. diamine. **x. bromide.** $C_6H_4(CH_2Br)_2$. **x. carbinol.** Dimethylphenylethanol, $C_6H_3Me_2.CH_2.CH_2OH$. **x. chloride.** X. dichloride. **x. cyanides:** $C_{10}H_8N_2$ = 156.13. $C_6H_4(CH_2CN)_2$. *ortho-* m.59. *meta-* m.28, $b._{300mm}308$. *para-* m.98. **x. diamines:** $C_8H_{12}N_2$ = 136.2. Diaminoxylene. $C_6H_4(CH_2NH_2)_2$, and $C_6H_2Me_2(NH_2)_2$. Used in organic synthesis, in the manufacture of dyes. **x. dichlorides:** $C_8H_8Cl_2$ = 175.02. Phthalylchloride $C_6H_4(CH_2Cl)_2$. *ortho-* m.55, b.240. *meta-* m.34, b.252. *para-* m.98, b.245. **x. glycol.** Xylenediol.

xylylenimine. C_8H_9N = 119.1. Dihydroisoindole, the heterocyclic compound,



A yellowish liquid, b.213.

xylylol. Xylenediol.

xysmalobin. $C_{46}H_{70}O_{20}$ = 952.49 (with $5H_2O$ = 1122.59). A crystalline glucoside from the root of *Xysmalobium undulatum*, wild cotton, milkbush, iShongwe, an Asclepiadaceae of South Africa; used as an emetic by the Zulus.

Y

Y. The symbol for yttrium.
y. The second dimension in coordinates, q.v.
Υ. See *upsilon.*
γ. See *gamma.*
yaba bark. Andira bark, cabbage tree bark. The bark of *Andira excelsa.* Cf. *andirin, goa.*
yabine. An alkaloid from yaba bark.
yacca gum. Acaroid resin.
yajeine. Harmine.
yajenine. An alkaloid from yaje, an apocynaceous plant of Southern Columbia.
yam. The tubers of *Dioscorea* (q.v.) species, which contain much starch and are cultivated for food in the tropics; as, **cush-cush-** The y. of *D. trifida.* **negro-** The y. of *D. cayennensis.* **white-** The y. of *D. alata.*
yara-yara. β-Naphthyl-methylether.
yard. yd. A unit of length in the English system. 1 yard = 3 feet = 36 inches = 0.914402 meter. **square-.** yd.^{2} or sq. yd. = 836.13 sq. meters. **cubic-.** yd.^{3} or cu. yd. = 764.535 cubic centimeters.
yarn. A thread. **synthetic-** See *rayon.*
yarrow. The dried leaves and inflorescence of *Achillea millefolium,* a Compositae. Used medicinally, as the fluid extract, as a tonic, alterative and astringent.
yatren. Loretin.
yaw root. Stillingia.
Yb. The symbol for ytterbium.
yd. An abbreviation for yard.
year. A measure of time, q.v.; the period of the earth's revolution around the sun

anomalistic y. 365 days 6 hours 13 min. 48 sec.
ordinary y... 365 days 5 hours 48 min. 46 sec.
sidereal y.... 365 days 6 hours 9 min. 9 sec.
average civil y.365.2422 mean solar days = 3.155693×10^7 seconds.

light- A unit of astronomical distance; the distance which light travels in one year, 5.9×10^{12} miles or 9.4627×10^{12} km. **solar-** Ordinary y. **tropical-** Ordinary y.
yeast. Cerevisiæ. A group of unicellular vegetable organisms or fungi of the family *Saccharomyces.* They ferment sugars to carbon dioxide and alcohol by virtue of the enzymes (zymases) they contain. They also contain invertase, an enzyme which inverts unfermentable sugars (as cane sugar) to fermentable sugars. **baker-, beer-** Compressed y. The moist living cells of *Saccharomyces cerevisiæ* compressed with some starchy or other absorbent material. Used in baking, brewing, and fermenting; and as a vitamin-rich nutrient. **bottom-** Low-. **brewer's-** High- and low-. **copro-** A yeast that contains a large quantity of coproporphyrin. **compressed-** Baker's-. **dried-** Y. dried at a low temperature, for storage or transport purposes, without greatly impairing its vitality. **high-** Top y. It rises during fermentation and is used for brewing English beers. It is distinguished from low y. by the absence of melibiase, an enzyme which ferments raffinose. **low-** Bottom y. It falls to the bottom of the liquid it is fermenting; used in brewing German beers. (Cf. *high-.*) **pressed-** Baker's-. **top-** High-. **wild-** A yeast not grown as a pure culture. They are responsible for the diseases of beer.

y. food. A mixture of mineral substances (phosphates, etc.) added to a fermenting liquid to stimulate the activity of the y. **y. gum.** A mannan formed from a combination of the principal carbohydrates of the y. cells with glycogen. **y. nucleic acid.** A nucleic acid from the nucleoprotein of yeast.
yeatmanite. $(MnZn)_{16}Sb_2Si_4O_{29}$. A triclinic mineral from Franklin, New Jersey.
yellow. A primary color having a shade between the orange and green of the spectrum. **acid-** An amino-azo dye used in dyeing. **chrome-** Lead chromate. **fast-** An amino-azo dye used in dyeing. **indicator-** A pigment of the eye. It is yellow in acid and colorless in alkaline solutions, and serves as a light filter. **Queen's-** Mercuric subsulfate.

y. acid. *1.3*-Dihydroxynaphthalene-*5.7*-disulfonic acid. **y. arsenic.** Orpiment. **y. bark.** Cinchona. **y. brass.** Muntz metal. **y. copper.** Chalcopyrite. **y. copperas.** Copiapite. **y. dock.** Rumex. **y. dyes.** See *dyes.* **y. flag.** The root of *Iris pseudacorus,* used as astringent. **y. earth.** Ocher. **y. jasmine.** Rumex. **y. lead ore.** Wulfenite. **y. ore.** Chalcopyrite. **y. parilla.** Menispermum. **y. pigments.** See *cadmium yellow, chrome yellow, gamboge, Indian yellow, litharge, orpiment, ocher.* **y. precipitate.** Yellow mercuric oxide. **y. prussiate of potash.** Potassium ferrocyanide. **y. prussiate of soda.** Sodium ferrocyanide. **y. puccoon.** Hydrastis. **y. resin.** Acaroid resin. **y. root.** Xanthorrhiza. **y. sandalwood.** See *sandalwood.* **y. sanders.** Yellow *sandalwood.* **y. ultramarine.** Barium chromate. **y. wax.** (1) A variety of bees-wax. (2) A semisolid residue remaining after the distillation of petroleum. **y. wood.** Xanthoxylum.
yenite. Ilvaite.
yenshee. Opium dross. A poor grade quality of opium, consisting of the dregs and carbonized opium remaining after smoking. It may contain from 1 to 10 % morphine. Cf. *chandoo, mudat.*
yerba. (1) Spanish for "herb." (2) Maté. **y. buena.** Micromeria. The dried leaves of *Micromeria douglassi,* a Labiatae of the Pacific Coast. Used medicinally, as the fluid extract, as an aromatic and carminative. **y. mate.** Maté. **y. reuma.** The dried herb of *Frankenia grandifolia,* a Frankeniaceae; used medicinally as a mild astringent. **y. sagrada.** The dried herb of *Lantana braziliensis,* a Verbenaceae; it is an antipyretic. Cf. *lantanine.* **y. santa.** Eriodictyon.
yerbine. An alkaloid from *Ilex paraguayensis,* which resembles caffeine.
yew. Taxus.
yield. The proportion of finished material obtained from the raw materials used; the

percentage actually obtained of the amount obtainable theoretically.

yield-point. The stress at which a marked and permanent increase in the deformation of a substance occurs without an increase in the load.

-yl. (1) A suffix generally indicating a monovalent hydrocarbon radical; as, methyl, ethyl. (2) A suffix indicating the presence of oxygen in a radical; as hydroxyl, uranyl, vanadyl, carbonyl. Cf. *-ylene.*

ylangol. $C_{10}H_{18}O$ = 154.20. An isomer of geraniol from ylang-ylang oil.

ylang-ylang. A tree of the Philippine and Malayan Islands, *Cananga odorata*, an Anonaceae; the flowers are the source of an essential oil. **y. oil.** Cananga oil. The essential oil of the flowers of the tree, *Cananga odorata*, d.0.911–0.958, sapon. no 90–138. It is used in perfumery, and contains linalool, geraniol and pinene.

-ylene. A suffix, generally indicating a bivalent hydrocarbon radical; as, methylene, ethylene. Cf. *-yl, -ylium, -ene.*

-yne*. A suffix indicating an acetylene linkage. Cf. *-ine.*

yobirine. $C_{19}H_{16}N_2$ = 272.14. A decomposition product of yohimbine.

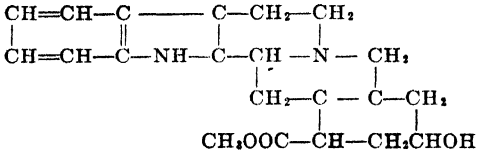
yoghurt. Soured milk used as a beverage in Hungary. Cf. *kefir.*

yohimbehe. The bark of *Corynanthe johimbe*, a Rubiaceae of the Cameroons, containing several alkaloids; used medicinally as an aphrodisiac.

yohimbenine. $C_{38}H_{45}O_6N_3$ = 603.6. Corynanthine. An alkaloid from the bark and leaves of yohimbehe.

yohimbic acid. $C_{20}H_{24}N_2O_3$ = 340.15. A monobasic acid derived from yohimbine, its methyl ester.

yohimbine. $C_{21}H_{26}O_3N_2$ = 352.15. Methyl yohimbate, corynine. An alkaloid from the bark of yohimbehe. White needles, m.234, slightly soluble in water, soluble in alcohol or ether. Cf. *aribine.*



y. hydrochloride. $C_{22}H_{28}O_3N_2.HCl$ = 404.8. Aphrodine. A colorless crystalline powder, soluble in water; used medicinally as an aphrodisiac.

yolk. The yellow part of an egg, which contains nutrient proteins and lecithins.

yoloy. A steel alloy containing small proportions of P, Ni and Cu.

yoshino. Tengujo. Kodzu. A strong thin paper used for making typewriter stencils; made in Japan from the fiber of the paper mulberry (*Broussonetia papyrifera*).

Young, James. 1811–1883. An English technical chemist noted for the development of the gas and oil industries. **Y., Sydney** 1857–1937. An English chemist, noted for boiling point laws. Cf. *Ramsay and Young equation.*

Young, Thomas. 1773–1829. An English physicist, noted for experiments in optics and mechanics. **Y.'s modulus.** Longitudinal elasticity. An elastic coefficient, or the force (dynes per cm.^{2} or pounds per in.^{2}) that will permanently deform a material by stretching, bending or twisting. The stretching modulus. $M = \text{stress/strain} = mgl/\pi r^2 s$, where s is the elongation produced by a weight, m, in a wire of length, l, and cross section of radius, r.

yperite. Mustard gas.

ysopol. $C_{10}H_{18}O$ = 154.20. A terpene-alcohol from hyssop.

Yt. Symbol for yttrium.

ytterbia. Ytterbium oxide.

ytterbite. Gadolinite.

ytterbium. Yb = 173.04. Neoytterbium, formerly supposed to be a mixture of aldebaranium and cassiopeium. A trivalent rare earth metal and element, atomic number 70, discovered by Marignac in 1878. **y. acetate.** $Yb(C_2H_3O_2)_3.4H_2O$ = 422.63. White hexagonal plates, d.2.09, soluble in water. **y. bromide.** $YbBr_3.8H_2O$ = 557.7. A green, hygroscopic crystalline powder, readily soluble in water. **y. chloride.** $YbCl_3.6H_2O$ = 388.0. Green rhombic crystals, d.2.575, m.150, soluble in water, alcohol or ether. **y. oxalate.** $Yb_2(C_2O_4)_3.10H_2O$ = 791.16. White crystals, d.2.644, insoluble in water. **y. oxide.** Yb_2O_3 = 395.2. Ytterbia. A white amorphous powder, d.0.17; insoluble in water, soluble in acids. **y. oxychloride.** YbOCl = 225.1. A white powder, insoluble in water. **y. sulfate.** $Yb_2(SO_4)_3$ = 635.41. A green crystalline powder, d.3.62, decomp. 900, soluble in water.

Ytterby. A small village in Sweden near which many rare earth minerals are found. The names *ytterbium, terbium, yttrium*, and *erbium* are derived from it.

yttergranate. A calcium-iron garnet, containing small amounts of yttrium compounds.

yttria. (1) Yttrium oxide. (2) Gadolinite. **y. group.** See *rare earth metals.*

yttrialite. $Y_2O_3.2SiO_2$. A green mineral, also containing iron and thorium.

yttrium. Y or Yt = 88.92. A trivalent rare-earth metal of the aluminum group and element, atomic number 39, discovered by Gadolin (1794) in gadolinite, which was separated by Mosander (1843) into yttria, terbia and erbia. A grayish-black, hexagonal, crystalline powder, d.3.8, which decomposes water and dilute acids; used in the manufacture of incandescent gas mantles. **y. acetate.** $Y(C_2H_3O_2)_3.8H_2O$ = 410.1. Colorless crystals, soluble in water. **y. bromide.** YBr_3 = 328.8. A white, deliquescent powder, very soluble in water. **y. carbonate.** $Y_2(CO_3)_3.3H_2O$ = 411.8. A pale reddish-white powder, insoluble in water, soluble in dilute acids. **y. chloride.** $YCl_3.6H_2O$ = 303.2. Pale red, transparent hygroscopic prisms, d.2.18, m.160, soluble in water or alcohol, insoluble in ether. **y. hydroxide.** $Y(OH)_3$ = 139.7. A white, gelatinous precipitate or amorphous powder, decomp. by heat, insoluble in water, soluble in alkalis, acids or ammonium salt solutions. **y. minerals.** The complex ores gadolinite, anerodite, rowlandite, thalenite, xenotime and yttrialite. **y. nitrate.** $Y(NO_3)_3.6H_2O$ = 382.8. Colorless or pale-red crystals, d.2.682, soluble in water or alcohol. **y. oxalate.** $Y_2(C_2O_4)_3.9H_2O$ = 603.98. A white crystalline powder, slightly soluble in water. **y. oxide.** Y_2O_3 = 225.0. Yttria. Colorless crystalline powder, d.5.035, insoluble in water and soluble in acids. **y. sulfate.** $Y_2(SO_4)_3.8H_2O$ = 610.1. Small, reddish-white crystals, d.2.612, decomp. 1000,

slightly soluble in water, soluble in sodium chloride or sulfate solutions. **y. sulfide.** Y_2S_3 = 274.0. A lemon-yellow powder, d.3.91, m.1900–1950, insoluble in water.

yttrocerite. A native mixed fluoride of yttrium, cerium, erbium and calcium.

yttrotantalite. $Y_4(Ta_2O_7)_3$. A tantalate of the rare earths, with iron and calcium. It contains helium.

yttrotitanite. A siliceous calcium titanate, which contains oxides of yttrium, aluminum and iron.

yucca. Adam's needle, Spanish bayonets. A Liliaceae, *Y. filamentosa*, of Southern California, Texas and Mexico, whose leaves furnish a fiber.

Yukawa particle. Heavy electron.

yukon. Heavy electron; a name in honor of Yukawa.

yulocrotine. $C_{19}H_{26}O_3N$ = 316.21. An alkaloid from *Julocroton Montevidensis*, an Euphorbiaceæ.

Z

Z. The symbol for: (1) atomic number (German: Atom Zahl); (2) grm.-equivalent weight.

z. (1) The third dimension of co-ordinates, q.v. (2) Symbol for the valency of an ion.

zaffer. Zaffre. A mixture or cobalt oxides and arsenates obtained by roasting cobalt ores. It is a raw material for the production of cobalt compounds.

zaffre. Zaffer.

zala. Borax.

zanaloin. The aloin from aloes of Zanzibar.

zaratite. $NiCO_3,2Ni(OH)_2.5H_2O$. Emerald nickel. A native nickel carbonate.

zea. (1) A genus of annual grasses to which Indian corn (maize) belongs. (2) Corn-silk, the fresh styles and stigmas of *Zea mays*, the maize plant; used medicinally, as the fluid extract, as a diuretic.

zearin. $C_{42}H_{88}O_4$ = 776.8. A colorless principle from various lichens.

zeaxanthin. $C_{40}H_{56}O_2$ = 568.4. A carotenoid (q.v.) coloring material from maize, egg yolk and many plants, isomer of xanthophyll and lutein. Yellow leaflets, m.101, optically inactive.

zebromal. $C_{11}H_{12}O_2Br_2$ = 336.0. Ethyldibromcinnamate, ethylphenyldibrompropionate, Ph.CHBr.CHBr.COOEt. A white, crystalline powder, insoluble in water, soluble in alcohol or oils; used medicinally as a sedative and hypnotic.

zedoary. The dried rhizomes of *Curcuma zeodaria*, a Zingiberaceae of the East Indies. It contains an essential oil, resin and mucilage, and like ginger is used as a stomachic and carminative. **z. oil.** The volatile oil of z., a dark viscid liquid, d.0.990–1.010, b.240–308, containing cineol.

Zeeman, Pieter. 1865–1943. A Dutch physicist noted for his development of the spectrum theory. **Z. effect.** A resolution of spectral lines observed when the source of light, as a flame, is placed in a strong magnetic field; the single lines are divided into three fine lines (a triplet).

zein. A prolamine from maize; it contains no tryptophane, cystine or lysine.

Zeisel method. The determination of methoxy groups by hydriodic acid. **Z. reaction.** The formation of methyl iodide from the reaction of methoxy-compounds with hydroiodic acid:

$$(1)\ ROMe + HI = R.OH + MeI$$
$$(2)\ MeI + AgNO_3 = AgI + MeNO_3$$

The silver iodide is weighed and the MeO-group calculated.

zelio paste. A rat-poison containing thallium.

Zellner's paper. Fluorescein paper.

Zenker's solution. A fixative and preservative for biological specimens: 2.5 gm. $K_2Cr_2O_7$, 1 gm. Na_2SO_4, 5 gm. $HgCl_2$, 5 cc. acetic acid in 100 cc. H_2O.

zeolite. A group of hydrated aluminum and calcium or sodium silicates capable of reacting in solution, by double decomposition, with salts of the alkali and alkali-earth metals. They are of the general type $Na_2O.2Al_2O_3.5SiO_2$ and $CaO.2Al_2O_3.5SiO_2$; some are used for water softening. Cf. *organolite*.

analcine	$NaAlSi_2O_6(H_2O)$
chabazite	$CaAl_2Si_4O_{12}(H_2O)_6$
heulandite	$CaAl_2Si_6O_{16}(H_2O)_5$
natrolite	$Na_2Al_2Si_3O_{10}(H_2O)_2$
stilbite	$CaAl_2Si_6O_{18}(H_2O)_6$
thomsonite?	$(Ca,Na_2)Al_2Si_2O_8(H_2O)_2$

artificial- Permutite. **organic-** A synthetic resin having the properties of a zeolite.

zephiran chloride. A mixture of high molecular weight alkyldimethylbenzylammonium chlorides; it is a cationic detergent and antiseptic.

zephirol. An earlier name for zephiran chloride.

zero. (1) The complete absence of a particular quantity. (2) The point at which a scale has the value of 0, *e.g.*, the zero of centigrade, the temperature of freezing water. **absolute-** See *absolute zero*.

zewaphosphate. A fertilizer (30 % P_2O_5) obtained by treating sulfite cellulose waste liquor with crude phosphates.

zeyherine. An alkaloid from the seeds of *Erythrina zeyheri*, a Leguminosae of South Africa.

zibet. Civet.

Ziehl's stain. Carbol-fuchsin.

Ziervogel process. A method of extracting silver by roasting the sulfide to produce silver sulfate, leaching this with water, and precipitating metallic silver with copper.

zinc. Zn = 65.38. A metal and element, atomic number 30, known to the Hindus and observed by Agricola, but described by Paracelsus in 1520. A bluish-white, brittle metal, d.6.7–7.2, m.419, b.918, insoluble in water, and soluble in acids or hot solutions of alkalis. Zinc occurs in nature principally as sulfide, carbonate and silicate. It is used as a reducing agent (indigo vats), in alloys, in the metal industry, and in the manufacture of zinc compounds. Chemically pure zinc is a reagent for the production of hydrogen (arsenic test). World production (spelter) 1941: 1,710,000 long tons; U.S.A. (647,000 tons) > Germany > Canada. **activated-** Zinc which has been granulated in the presence of cadmium sulfate for use in the Marsh test (q.v.) for arsenic. **butter of-** Zinc chloride. **granulated-** Metallic zinc in the form of distorted granules, prepared by pouring the molten metal into water. **powdered-** Finely powdered Zn used as reagent. Cf. *zinc dust*.

z. acetate. $Zn(C_2H_3O_2)_2.3H_2O$ = 237.5. Colorless, monoclinic plates, d.1.72, m.242, soluble in water or alcohol. Used as a reagent, as a mordant in dyeing, in the manufacture of glazes for porcelain, and medicinally as an emetic and in gargles and disinfectants. *fused-* $Zn(C_2H_3O_2)_2$ = 183.4. A white, fused mass, soluble in water. **z. albuminate.** A compound of albumin and zinc. Yellowish scales, slightly soluble in water. **z. alkyls.** A group of organic com-

pounds of the general type, ZnR_2, in which R is an alkyl radical:

zinc methide, $ZnMe_2$	(q.v.)
zinc ethide, $ZnEt_2$	(q.v.)
zinc propyl, $ZnPr_2$	b.146
zinc isopropyl, $Zn(CHMe_2)_2$	b.136
zinc isobutyl, $Zn(CH_2CHMe_2)_2$	b.166
zinc isoamyl, $Zn(CH_2CH_2CHMe_2)_2$	b.210

z. alkyl condensation. Frankland's reaction. A synthesis of hydrocarbons, in which zinc is removed from a zinc alkyl as hydrate or iodide: $2R_3CI + ZnMe_2 = 2R_3CMe + ZnI_2$. **z. alum.** Aluminum zinc sulfate. **z. amalgam.** A mixture of zinc and mercury, used as a reducing agent, or in electric batteries. **z. ammonium salts.** Complex salts of the type $Zn(NH_3)_4Cl_2.H_2O$, $Zn(NH_3)_6SO_4$ etc. analogous to copper-ammonium salts. **z. arsenate.** $ZnHAsO_4$ = 205.4. A white, amorphous powder, slightly soluble in water, soluble in acids. Cf. *adamite*. **z. arsenide.** Zn_3As_2 = 346.06. **z. arsenite.** $Zn(AsO_2)_2$ = 279.4. A colorless powder; insoluble in water, soluble in acids. **z. ashes.** The oxidized z. removed from the surface of a galvanizing bath. **z. benzoate.** $Zn(C_7H_5O_2)_2$ = 307.46. A white powder; soluble in water. **z. biborate.** Z. tetraborate. **z. bichromate.** Z. dichromate. **z. blende.** Sphalerite. **z. bloom.** Z. oxide. **z. borate.** $ZnB_4O_7.7H_2O$ = 346.7. An amorphous, white powder, used medicinally as a dusting powder and antiseptic. **z. bromate.** $Zn(BrO_3)_2$ = 321.31. A white, hygroscopic powder, m.100, soluble in water; used as an antiseptic. **z. bromide.** $ZnBr_2$ = 225.2. Colorless, hygroscopic needles, d.4.219, m.394, b.690; soluble in water, alcohol or ether. Used as a reagent, and medicinally as a sedative and antispasmodic. **z. butter.** Z. chloride. **z. carbonate.** $ZnCO_3H_2O$ = 143.40. Tutia. A white, rhombic, crystalline powder, d.4.44, decomp. 300, insoluble in water; used as an antiseptic in face powders. Cf. *zinc spar*. **z. chlorate.** $Zn(ClO_3)_2.6H_2O$ = 340.4. Colorless, hygroscopic crystals, m.60; soluble in water or alcohol. **z. chloride.** $ZnCl_2$ = 136.3. Zinc butter. A white, deliquescent, octahedral, crystalline powder, d.2.907, m.365, b.730, soluble in water, alcohol or ether. Used as a reagent for alkaloids; solvent for cellulose; medicinally as an antiseptic, astringent, and escharotic; as a preservative, in embalming material; as a mordant; and in soldering, as a flux. **z. chloroiodide.** A mixture of zinc iodide and chloride. Used as the saturated solution as a microchemical test for cellulose (blue color) and tannin (violet or red color). **z. chloroiodide solution.** Naegeli's solution. A microchemical test solution prepared by decomposing hydrochloric acid with zinc and saturating the solution with potassium iodide and iodine; cf. *Herzberg's stain*. **z. chromate.** $ZnCrO_4.7H_2O$ = 307.6. Zinc yellow, buttercup yellow. A yellow powder, soluble in water; used as a pigment. **z. citrate.** $Zn_3(C_6H_5O_7)_2.2H_2O$ = 610.3. A white amorphous powder, slightly soluble in water, used medicinally as an antiepileptic. **z. copper couple.** A sheet of zinc coated with a black deposit of copper by immersion in an acid solution of copper sulfate. It liberates nascent hydrogen from acid solutions, and will reduce nitrates to ammonia. Hence its use in water analysis for the determination of small quantities of nitrates. **z. cyanide.** $Zn(CN)_2$ = 117.4. Colorless orthorhombic prisms, decomp. by heat, insoluble in water or alcohol, soluble in cyanide solutions. Used as an insecticide, and medicinally as a disinfectant and anthelmintic. **z. dichromate.** $ZnCr_2O_7$ = 281.6. Z. bichromate. An orange-yellow powder; soluble in water. **z. diethyl.*** Z. ethide. **z. dimethyl.*** Z. methide. **z. dithiofuroate.** $(C_4H_3OCS_2)_2Zn$. Furac II. A brown powder used as accelerator in the vulcanization of rubber. **z. dust.** (1) Finely-divided zinc, used as a reducing agent. (2) The flue-dust of smelters, containing zinc, zinc oxide and impurities; used as a gray paint. **z. ethide.** $Zn(C_2H_5)_2$ = 123.5. Zinc ethyl. Diethyl zinc.* A colorless liquid which ignites on contact with air, d.1.18, m.−28, b.118; violently decomp. by water. Used in organic synthesis. **z. ethyl.** Z. ethide. **z. ethylsulfate.** $Zn(C_2H_5SO_4)_2$ = 315.5. Colorless hygroscopic leaflets, soluble in water or alcohol. **z. ferrocyanide.** $Zn_2Fe(CN)_6.3H_2O$ = 396.7. A white powder, insoluble in water or alcohol, soluble in ammonia water. Used as an antiseptic. **z. flowers.** Z. oxide. **z. fluoride.** ZnF_2 = 103.4. A white powder, slightly soluble in water. **z. fluosilicate.** $ZnSiF_6.6H_2O$ = 315.53. Hexagonal prisms, d.2.104, very soluble in water. **z. foil.** Sheets of zinc prepared by heating the metal to 100–150°C. and rolling it. **z. formate.** $Zn(CHO_2)_2$ = 155.4. Colorless crystals, d.2.36, soluble in water, insoluble in alcohol, used medicinally as an antiseptic. *dihydrate.* $Zn(CHO_2)_2.2H_2O$ = 191.43. Monoclinic white crystals, d.2.205, soluble in water. **z. glycerophosphate.** $Zn(C_3H_7O_2)PO_4$ = 235.44. A white, amorphous powder, soluble in water, insoluble in alcohol or ether; used medicinally. **z. hydroxide.** $Zn(OH)_2$ = 99.4. A white powder or rhombic prisms, d.3.053, decomp. by heat, insoluble in water, soluble in acids or alkalis. **z. hypophosphite.** $Zn(H_2PO_2)_2.H_2O$ = 245.4. White, deliquescent crystals; soluble in water. Used medicinally as an antiseptic and astringent. **z. iodate.** $Zn(IO_3)_2$ = 415.1. A white, crystalline powder; slightly soluble in water. **z. iodide.** ZnI_2 = 319.2. A colorless powder or octahedral crystals, d.4.696, m.446, b.625, decomp. by further heat, soluble in water, alcohol or ether. Used as a reagent for detecting chlorine and narceine, and medicinally as an alterant and antiseptic. **z. iodide-starch paper.** A white filter paper, impregnated with a zinc iodide-starch solution. Used to detect free chlorine, iodine or ozone (blue color). **z. iodide-starch solution.** A solution of zinc iodide and soluble starch; used as a test-reagent for oxidizing agents, and as an indicator. **z. lactate.** $Zn(C_3H_5O_3)_2.3H_2O$ = 297.5. A colorless, crystalline powder, slightly soluble in water; used medicinally as an antiepileptic. **z. malate.** $ZnC_4H_4O_5$ = 197.4. A white, crystalline powder, soluble in water. **z. methide.** $Zn(CH_3)_2$ = 95.43. Zinc methyl, dimethyl zinc.* A clear, colorless liquid which ignites on contact with air, $d._{16}°1.39$, m.−40, b.46, decomp. by water or alcohol. Used in organic synthesis. **z. methyl.** Z. methide. **z. minerals.** Zinc occurs in nature widely diffused as sulfide, carbonate and silicate:

sphalerite (regular)	ZnS
wurtzite (hexagonal)	ZnS
zincite	ZnO
gahnite, zinc spinel	$ZnAl_2O_4$
franklinite	$ZnFe_2O_4$

smithsonite, zinc spar	$ZnCO_3$
hydrozincite, zinc bloom	$Zn_5(OH)_4CO_3$
willemite	Zn_2SiO_4
calamine	$Zn_2H_2SiO_5$
goslarite	$ZnSO_4.7H_2O$

z. monochloracetate. $Zn(C_2H_2ClO_2)_2$ = 252.35. A colorless powder, soluble in water; used medicinally as an antiseptic. **z. nitrate.** $Zn(NO_3)_2.6H_2O$ = 297.50. Colorless, tetragonal crystals, d.2.065, m.36, b.130, soluble in water, alcohol or ether. Used as a reagent, medicinally as an escharotic, and as a mordant in dyeing. **z. nitride.** Zn_3N_2 = 224.16. A green powder, readily decomp. by water to zinc oxide and ammonia. **z. oleate.** $Zn(C_{18}H_{33}O_2)_2$ = 625.89. A white, greasy, granular powder; insoluble in water, soluble in alcohol, ether or benzene; used in ointments, and as a drier in varnishes. **z. oxalate.** $ZnC_2O_4.2H_2O$ = 189.4. A white powder, d.2.562, slightly soluble in water, soluble in acids or alkalis. **z. oxide.** ZnO = 81.4. Philosopher's wool. A colorless, amorphous powder or hexagonal crystals, d.5.42, insoluble in water, soluble in acids, alkalis or ammonium salt solutions. Used as a reagent and neutralizing agent, in the manufacture of rubber goods, glass, pigments, cosmetics, and dusting powders; medicinally as an antiseptic and sedative. **z. oxide cement.** See *dental cement*. **z. perborate.** $Zn(BO_3)_2$ = 183.0. A white, amorphous powder, insoluble in water; used as an oxidizing agent and antiseptic in cosmetics. **z. perhydrol.** Z. peroxide. **z. permanganate.** $Zn(MnO_4)_2.6H_2O$ = 411.5. Dark brown, nearly black, deliquescent lustrous crystals, soluble in water. Used as an oxidizing agent, astringent and antiseptic. **z. peroxide.** ZnO_2 = 97.4. Zinc perhydrol. A yellowish-white, voluminous powder, insoluble in water, decomp. by acids. Used as a bactericide and antiseptic. **z. phenate.** $Zn(C_6H_5O)_2$ = 251.46. Zinc carbonate. A white powder; slightly soluble in water. Used medicinally as a dusting powder and antiseptic. **z. phenolsulfonate.** $Zn(C_6H_5SO_4)_2$ = 411.60. Zinc sulfophenate, z. sulfocarbolate. Colorless prismatic crystals, soluble in water or alcohol; used medicinally as an antiseptic. **z. phosphate.** $Zn_3(PO_4)_2$ = 386.2. A white powder or prisms, d.3.878, m. at red-heat, insoluble in water or alcohol, soluble in acids or ammonium salt solutions. Used as a reagent, and medicinally, as an antiseptic, tonic and astringent. *ortho-* Z. phosphate. *pyro-* $Zn_2P_2O_7$ = 304.8. A white powder, insoluble in water or alcohol, soluble in acids, alkalis or ammonium salt solutions. **z. phosphide.** Zn_3P_2 = 258.2. A spongy, gray, metallic mass or a dark gray powder, d.4.72, decomp. in moist air, insoluble in water or alcohol, decomp. by acids. Used medicinally as a phosphorus substitute, and as a reagent in making hydrogen phosphide. **z. phosphite.** $ZnHPO_3$ = 145.4. A white, granular powder, soluble in water; used medicinally as a tonic and antiseptic. **z. picrate.** $Zn[C_6H_2O_2(NO_2)_3]_2$ = 489.47. A yellow, crystalline, explosive powder; used medicinally in its hydrated form as an antiseptic. **z. potassium cyanide.** $K_2Zn(CN)_4$ = 247.7. Colorless crystals, soluble in water; used medicinally as a tonic. **z. potassium iodide.** K_2ZnI_4 = 651.1. Colorless crystals, soluble in water; used as a reagent. **z. potassium sulfate.** $K_2Zn(SO_4)_2$ = 335.7. Colorless, hygroscopic crystals; soluble in water. **z. pyrophosphate.** See *z. phosphate*. **z. rhodanide.** Z. thiocyanate. **z. salicylate.** $Zn(C_6H_4OHCOO)_2.3H_2O$ = 393.5. Colorless needles, soluble in water or alcohol. **z. silicate.** $ZnSiO_3$ = 141.3. A white powder, insoluble in water. **z. silicofluoride.** $ZnSiF_6.6H_2O$ = 315.4. Colorless crystals, soluble in water. **z. spar.** $ZnCO_3$. A native zinc carbonate, and an important zinc ore. **z. spinel.** Gahnite. **z. stearate.** $Zn(C_{18}H_{35}O_2)_2$ = 632.0. A white, granular, greasy powder, insoluble in water. Used medicinally as an antiseptic and dusting powder, and as a drier for varnishes and paints. **z. succinate.** $ZnC_4H_4O_4$ = 181.4. A white powder, insoluble in water. **z. sulfanilate.** $Zn(C_6H_4NH_2SO_3)_2.4H_2O$ = 481.5. Nizin. A colorless powder, insoluble in water, soluble in alcohol; used medicinally as an astringent and antiseptic. **z. sulfate.** $ZnSO_4$ = 161.45. *anhydrous-* Colorless crystals or a white fused mass, d.3.49, soluble in water. *dihydrate-* $ZnSO_4.2H_2O$ = 197.48. Fused sticks or white powder, soluble in water. *heptahydrate-* $ZnSO_4.7H_2O$ = 287.6, crystalline or common-, zinc vitriol, white vitriol. White, rhombic, prismatic, or monoclinic crystals, d.2.015, m.50; soluble in water, alcohol or ether. Used as a reagent, for standardizing volumetric solutions; for precipitating proteins; medicinally, as an antiseptic eye-wash, gargle and emetic; as a mordant in dyeing and textile printing; as a preservative for skins and woods; as a weed killer and in the manufacture of paints and varnishes. **z. sulfide.** ZnS = 97.4. Yellowish or grayish-white hexagonal or tetragonal crystals, d.3.98, m.1049; insoluble in water, soluble in acids. Used as a pigment and as a reagent in testing the acidity of soils. Cf. *Sidot's blende*. **z. sulfite.** $ZnSO_3.2\frac{1}{2}H_2O$ = 190.49. A white, crystalline powder, slightly soluble in water, soluble in ammonium salts solutions; used as a preservative for anatomical specimens, and as an antiseptic. **z. sulfocarbolate.** Z. phenolsulfonate. **z. sulfocyanate.** Z. thiocyanate. **z. sulfhydrate.** $Zn(SH)_2$ = 131.4. A white powder, insoluble in water, decomp. when dry (so it is kept under water); used as an intestinal antiseptic. **z. tartrate.** $ZnC_4H_4O_6$ = 213.5. A white powder, slightly soluble in water. **z. tetraborate.** ZnB_4O_7 = 220.7. Zinc borate, z. biborate. A white powder, insoluble in water, soluble in acids; used as an antiseptic. **z. thiocyanate.** $Zn(CNS)_2$ = 181.5. Z. rhodanate. Z. sulfocyanate. White deliquescent crystals, soluble in water. **z. valerate.** $Zn(C_5H_9O_2)_2.2H_2O$ = 303.5. A white, crystalline powder, soluble in water or alcohol, used medicinally as an antispasmodic and astringent. **z. vitriol.** Z. sulfate. **z. white.** (1) Z. oxide. (2) A mixture of 80 % ZnO and 20 % $BaSO_4$ (German usage). **z. yellow.** Z. chromate.

zincamide. $Zn(NH_2)_2$ = 97.43.

zincate. A salt of amphoteric zinc hydroxide, of the type, M_2ZnO_2. They form various hydrated ions, in solution; as, $Zn(OH)_3^-$, $Zn(OH)_3^{--}$.

zincic acid. The amphoteric form of zinc hydroxide: $H_2ZnO_2 \rightleftharpoons Zn(OH)_2$.

zincite. A rare red, native zinc oxide, ZnO; hardness 4–4.4, d.5.4–5.7.

zincography. Process engraving. The reproduction of pictures, graphs, etc. on zinc plates, the surface of which is first coated with special wax, on which is drawn or photographed the

picture to be printed. A strong acid dissolves the zinc not covered by the drawing etc., which is thus left in relief like a printer's type.

zinethyl. Zinc ethide.

zingerone. $C_{11}H_{14}O_3$ = 194.1. *4*-Hydroxy-*3*-methoxyphenylethyl (methyl) ketone, $MeCOCH_2CH_2C_6H_3(OH)OMe$. A ketone with a pungent taste, in ginger. Colorless crystals, m.41, $b._{14mm}$188 slightly soluble in water. Cf. *capsicin*.

zingiber. Ginger.

Zingiberaceae. See *Scitaminaceae*.

zingiberene. $C_{15}H_{24}$ = 204.19. *1*-Methyl-*4*-propenylcyclohexane. A sesquiterpene from oil of ginger; d.0.872, b.279.

zingiberol. $C_{15}H_{26}O$ = 222.2. An alcohol, $b._{14mm}$157, from ginger.

zinin. Azoxybenzene.

zinkenite. $PbSb_2S_3$. A native lead sulfo-antimonite.

zinkite. Zincite.

zinnkies. Cu_2FeSnS_4. A native copper and iron sulfostannate.

zinnwaldite. $(K, Li)_2FeAl_2Si_6O_{16}F_2$. A pale violet, yellow or brown lithia-mica.

zippeite. A native uranium sulfate, which contains less than 5 % of copper oxide.

zircon. $ZrSiO_4$. Ostranite. Jargon. A native zirconium silicate. Fairly transparent, yellow crystals, d.4.68–4.70, hardness 7.5; used as a source of Zr compounds. The transparent orange-colored variety is a gem (hyacinth, jargon). See *starlite*, *malacon*, *oerstedite*, **z. alba.** Zirconium oxide.

zirconate. A salt of amphoteric zirconium hydroxide of the type, M_2ZrO_3.

zirconia. Zirconium oxide.

zirconic acid. Zirconium hydroxide. **z. anhydride.** Zirconium oxide.

zirconium. Zr = 91.22. A rare earth-metal and element of the carbon-group, atomic number 40, discovered by Klaproth in 1789. A silver-white, crystalline or gray amorphous metal, d.4.15 (cryst.) 6.53 (amorphous), m.2130, insoluble in water or acids, soluble in hydrofluoric acid, aqua regia or molten alkalis. It has a valency of four and forms 3 series of compounds: normal, Zr^{++++}; basic ZnO^{++} (zirconyl); and ZrO_3^{--} (zirconates). Used in steel manufacture as a deoxidizer, denitrifier and desulfurizer, in the form of silicon-zirconium or ferrosilicon zirconium; in many alloys for wires and filaments; as a "getter" in radio tubes; as an x-ray filter; with 40 % Mg as flash powder; coated on aluminum foil for flash bulbs; and for making Cs from $Cs_2Cr_2O_7$. World production in 1941, 14,000 short tons; U.S. > India > Brazil > Madagascar. **z. bromide.** $ZrBr_4$ = 411.0. **Z. tetrabromide.** A white powder, decomp. violently by water to form zirconyl bromide. **z. carbonate.** Zirconyl carbonate. **z. chloride.** $ZrCl_4$ = 232.8. **Z. tetrachloride.** Colorless lustrous crystals, subliming 350, decomp. by water to zirconyl chloride; used in organic synthesis (Friedel-Craft reaction). **z. dioxide.** Zirconium oxide. **z. fluoride.** ZrF_4 = 167.2. Colorless crystals d.4.433, m. at red heat, insoluble in water. **z. hydroxide** $Zr(OH)_4$ = 159.2. A colorless, amorphous powder, insoluble in water, soluble in acids with the formation of Zr^{++++} and ZnO^{++} ions, and in alkalis with formation of ZrO_3^{--} ions. **z. iodide.** ZrI_4 = 599.1. Very hygroscopic, brownish-red crystals soluble in water. **z. nitrate.** Zirconyl nitrate. **z. oxide.** ZrO_2 = 123.2. Zirconia, zircon alba, **z.** anhydride, **z.** dioxide, native as baddeleyite, zirkite and becarite. It occurs in three crystalline forms as a heavy, white powder, m.2730, insoluble in water or acids, soluble in hot sulfuric acid or hydrofluoric acid. It is a durable refractory and an effective opacifier of fused enamels, glass, and glazes; also used in the manufacture of Welsbach mantles, with silica and graphite for safe and vault walls, and medicinally in x-ray photography as a substitute for bismuth salts. **z. oxybromide.** Zirconyl bromide. **z. oxychloride.** Zirconyl chloride. **z. silicate.** See *zircon*, *auerbachite* and *azorite*. **z. sulfate.** $Zr(SO_4)_2.4H_2O$ = 355.4. A colorless, crystalline powder, soluble in water; used as a reagent for potassium. **z. tetrachloride.** Z. chloride.

zirconyl. The divalent ZrO= radical. **z. bromide.** $ZrOBr_2$ = 267.1. Zirconium oxybromide. A colorless, very deliquescent powder, decomp. in moist air. **z. carbonate.** $ZrOCO_3$ = 167.22. An amorphous, white powder, insoluble in water, soluble in acids. **z. chloride.** $ZrOCl_2$ = 178.14. Zirconium oxychloride, basic zirconium chloride. Colorless, long, silky needles; soluble in water or alcohol. **z. hydroxide.** $ZrO(OH)_2$ = 141.24. A white, amorphous powder, insoluble in water, soluble in alkalis or acids. **z. nitrate.** $ZrO(NO_3)_2$ = 231.24. A white, crystalline powder, soluble in water or alcohol; used in the manufacture of Welsbach mantles. **z. phosphate.** $(ZrO)_3(PO_4)_2.8H_2O$ = 655.79. A colorless, dense, amorphous powder; insoluble in water.

zirkite. ZrO_2. A native zirconia ore from Brazil; used as fire-brick, cement and opacifier.

zirlite. $Al(OH)_3$. A light-yellow, native, aluminum hydroxide.

Zn. The symbol for zinc.

zoetrope. An early name for the cinematograph.

zoisite. $Ca_2Al_3(OH)(SiO_4)_3$. Thulite. A native, calcium, aluminum orthosilicate, which gives its name to a group of silica minerals, q.v.

Zöller, Philipp. 1833–1885. A German chemist, noted for agricultural and biochemical work.

zone. Any area or space of interest; especially a region of oriented molecules. Cf. *orientation*. It differs from a phase (which is homogeneous with molecules in random directions) since it is heterogeneous with molecules oriented. Many colloidal phenomena and processes are thereby explained; as, adsorption (wetting and flotation), protective colloid action, gel formation, thixotropy, the passivity of metals. **interfacial-** The layer of oriented A and B molecules between two phases A and B. **micellar-** A region of oriented molecules, either isolated or continuous, in a surrounding phase (which may be absent, as, in an elastic gel). **monomolecular-** A layer of oriented C molecules between two phases A and B. **polar-** A z. which consists of oriented dipoles; as in solvates, q.v.

zoo- A prefix derived from the Greek, indicating a relation to "animals."

zoochemistry. A branch of biological chemistry dealing with the composition of and reactions occurring in animal organisms.

zoogloea, zoogloea. A firm gelatinous mass, consisting of bacteria embedded in a jelly-like matrix.

zoology. A branch of biological science that deals with the classification, structure and function of animals.

zoomaric acid. $C_{16}H_{28}O_2$ = 240.22. Hexadecenoic acid. The monobasic acid $Me(CH_2)_5CH:CH(CH_2)_8COOH$, from marine animal oils such as cod-liver and whale oils. It is probably identical with palmitoleic acid.

zoospore. A mobile spore, or swarm spore, produced by many fungi.

zoosterol. A sterol (q.v.) of animal origin; *e.g.*, cholesterol.

zootoxin. A poison derived from an animal; as, bufotalin, venoms.

Zosimos of Panopolis. Middle 5th. century B.C. A Greek writer of Egypt, who wrote 20 chemical works, and show that the term "chemistry" is not of Arabic origin (*περι της χημειας* = On Chemistry).

Zr. The symbol for zirconium.

Zsigmondy, Richard. 1865–1929. An Austrian chemist, noted for his research on colloids. **Z. filter.** A series of graded ultra-filters for separating ultramicroscopical particles or colloids from solutions, according to their sizes. They consist of semi-permeable membranes of varied compositions and degrees of permeability; used in analytical and physiological chemistry.

zuckerin. Saccharin.

zwitter-ion. A complex ion that is both positively and negatively charged; as, $R\begin{matrix}X^- \\ Y^+\end{matrix}$ *e.g.*, $^+NH_3.R.SO_3^-$ or $^+NH_3.R.COO^-$. Cf. *amphoteric.*

zygadenine. $C_{39}H_{63}O_{10}N$ = 705.5. An alkaloid from the bulbs of *Zygadenus nuttalli*, a Liliaceae of the Rocky Mountains. It resembles veratrine.

zygograph. (Greek; "zygon," a "yoke.") A diagram showing the relationship between the composition of a vapour and that of a liquid in equilibrium with it; used in distillation problems.

zygote. A fertilized cell. See *gamete.*

zyklon. Hydrocyanic acid absorbed in fuller's earth, used in fumigation.

zylonite. Celluloid.

zymase. An enzyme of yeast that splits sugar into alcohol and carbon dioxide. It can be separated from the yeast cell and still retain its activity. Cf. *invertase.*

zyme. A ferment, especially a disease-producing ferment or virus.

zymin. An acetone-dried yeast.

zymochemistry. The chemistry of fermentation.

zymo-excitor. A kinase, or substance that converts a zymogen into an active enzyme.

zymogen. The mother-substance of an enzyme; a substance secreted from tissues or glands that is split into an active enzyme and protein by the action of a kinase or zymo-excitor.

zymohexose. A monosaccharide that ferments readily; as, d-glucose, d-fructose, d-mannose.

zymohydrolysis. Zymolysis.

zymology. A branch of science that deals with the action and composition of ferments or enzymes.

zymolysis. Zymohydrolysis. A hydrolytic or other chemical reaction produced by an enzyme.

zymoplasm. Thrombase.

zymosis. Fermentation, or reactions caused by enzymes.

zymosterol. $C_{27}H_{44}O$ = 384.3. A sterol (q.v.) from yeast, m.108, $[\alpha]_D$ +17.3°, insoluble in water.

zymurgy. A branch of chemistry that deals with the application of enzymes in brewing, distilling or wine-making. In its broader meaning it includes the processes of fermentation for manufacturing purposes, as in the tobacco, cheese, indigo or leather industry.
